  constexpr auto uses_allocator_construction_args(const Alloc& alloc,
                                                  U&& u, V&& v) noexcept -> see below;
```

10 *Constraints*: `T` is a specialization of `pair`.

11 *Effects*: Equivalent to:

```
return uses_allocator_construction_args<T>(alloc, piecewise_construct,
                                           forward_as_tuple(std::forward<U>(u)),
                                           forward_as_tuple(std::forward<V>(v)));
```

```
template<class T, class Alloc, class U, class V>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc,
                                                  const pair<U,V>& pr) noexcept -> see below;
```

12 *Constraints*: `T` is a specialization of `pair`.

13 *Effects*: Equivalent to:

```
return uses_allocator_construction_args<T>(alloc, piecewise_construct,
                                           forward_as_tuple(pr.first),
                                           forward_as_tuple(pr.second));
```

```
template<class T, class Alloc, class U, class V>
  constexpr auto uses_allocator_construction_args(const Alloc& alloc,
                                                  pair<U,V>&& pr) noexcept -> see below;
```

14 *Constraints*: `T` is a specialization of `pair`.

15 *Effects*: Equivalent to:

```
return uses_allocator_construction_args<T>(alloc, piecewise_construct,
                                           forward_as_tuple(std::move(pr).first),
                                           forward_as_tuple(std::move(pr).second));
```

```
template<class T, class Alloc, class... Args>
  constexpr T make_obj_using_allocator(const Alloc& alloc, Args&&... args);
```

16 *Effects*: Equivalent to:

```
return make_from_tuple<T>(uses_allocator_construction_args<T>(
                          alloc, std::forward<Args>(args)...));
```

```
template<class T, class Alloc, class... Args>
  constexpr T* uninitialized_construct_using_allocator(T* p, const Alloc& alloc, Args&&... args);
```

17 *Effects*: Equivalent to:

```
return apply([&]<class... U>(U&&... xs) {
       return construct_at(p, std::forward<U>(xs)...);
     }, uses_allocator_construction_args<T>(alloc, std::forward<Args>(args)...));
```

20.10.9 Allocator traits [allocator.traits]

20.10.9.1 General [allocator.traits.general]

1 The class template `allocator_traits` supplies a uniform interface to all allocator types. An allocator cannot be a non-class type, however, even if `allocator_traits` supplies the entire required interface.

[*Note 1*: Thus, it is always possible to create a derived class from an allocator. — *end note*]

```
namespace std {
  template<class Alloc> struct allocator_traits {
    using allocator_type     = Alloc;

    using value_type         = typename Alloc::value_type;

    using pointer            = see below;
    using const_pointer      = see below;
    using void_pointer       = see below;
    using const_void_pointer = see below;

    using difference_type    = see below;
    using size_type          = see below;

    using propagate_on_container_copy_assignment = see below;
    using propagate_on_container_move_assignment = see below;
    using propagate_on_container_swap            = see below;
    using is_always_equal                        = see below;

    template<class T> using rebind_alloc = see below;
    template<class T> using rebind_traits = allocator_traits<rebind_alloc<T>>;

    [[nodiscard]] static constexpr pointer allocate(Alloc& a, size_type n);
    [[nodiscard]] static constexpr pointer allocate(Alloc& a, size_type n,
                                                    const_void_pointer hint);

    static constexpr void deallocate(Alloc& a, pointer p, size_type n);

    template<class T, class... Args>
      static constexpr void construct(Alloc& a, T* p, Args&&... args);

    template<class T>
      static constexpr void destroy(Alloc& a, T* p);

    static constexpr size_type max_size(const Alloc& a) noexcept;

    static constexpr Alloc select_on_container_copy_construction(const Alloc& rhs);
  };
}
```

20.10.9.2 Member types [allocator.traits.types]

```
using pointer = see below;
```

1 *Type*: `Alloc::pointer` if the *qualified-id* `Alloc::pointer` is valid and denotes a type (13.10.3); otherwise, `value_type*`.

```
using const_pointer = see below;
```

2 *Type*: `Alloc::const_pointer` if the *qualified-id* `Alloc::const_pointer` is valid and denotes a type (13.10.3); otherwise, `pointer_traits<pointer>::rebind<const value_type>`.

```
using void_pointer = see below;
```

3 *Type*: `Alloc::void_pointer` if the *qualified-id* `Alloc::void_pointer` is valid and denotes a type (13.10.3); otherwise, `pointer_traits<pointer>::rebind<void>`.

```
using const_void_pointer = see below;
```

4 *Type*: `Alloc::const_void_pointer` if the *qualified-id* `Alloc::const_void_pointer` is valid and denotes a type (13.10.3); otherwise, `pointer_traits<pointer>::rebind<const void>`.

```
using difference_type = see below;
```

5 *Type*: `Alloc::difference_type` if the *qualified-id* `Alloc::difference_type` is valid and denotes a type (13.10.3); otherwise, `pointer_traits<pointer>::difference_type`.

```
using size_type = see below;
```

6 *Type*: `Alloc::size_type` if the *qualified-id* `Alloc::size_type` is valid and denotes a type (13.10.3); otherwise, `make_unsigned_t<difference_type>`.

```
using propagate_on_container_copy_assignment = see below;
```

7 *Type*: `Alloc::propagate_on_container_copy_assignment` if the *qualified-id* `Alloc::propagate_on_container_copy_assignment` is valid and denotes a type (13.10.3); otherwise `false_type`.

```
using propagate_on_container_move_assignment = see below;
```

8 *Type*: `Alloc::propagate_on_container_move_assignment` if the *qualified-id* `Alloc::propagate_on_container_move_assignment` is valid and denotes a type (13.10.3); otherwise `false_type`.

```
using propagate_on_container_swap = see below;
```

9 *Type*: `Alloc::propagate_on_container_swap` if the *qualified-id* `Alloc::propagate_on_container_swap` is valid and denotes a type (13.10.3); otherwise `false_type`.

```
using is_always_equal = see below;
```

10 *Type*: `Alloc::is_always_equal` if the *qualified-id* `Alloc::is_always_equal` is valid and denotes a type (13.10.3); otherwise `is_empty<Alloc>::type`.

```
template<class T> using rebind_alloc = see below;
```

11 *Alias template*: `Alloc::rebind<T>::other` if the *qualified-id* `Alloc::rebind<T>::other` is valid and denotes a type (13.10.3); otherwise, `Alloc<T, Args>` if `Alloc` is a class template instantiation of the form `Alloc<U, Args>`, where `Args` is zero or more type arguments; otherwise, the instantiation of `rebind_alloc` is ill-formed.

20.10.9.3 Static member functions [allocator.traits.members]

```
[[nodiscard]] static constexpr pointer allocate(Alloc& a, size_type n);
```

1 *Returns*: `a.allocate(n)`.

```
[[nodiscard]] static constexpr pointer allocate(Alloc& a, size_type n, const_void_pointer hint);
```

2 *Returns*: `a.allocate(n, hint)` if that expression is well-formed; otherwise, `a.allocate(n)`.

```
static constexpr void deallocate(Alloc& a, pointer p, size_type n);
```

3 *Effects*: Calls `a.deallocate(p, n)`.

4 *Throws*: Nothing.

```
template<class T, class... Args>
  static constexpr void construct(Alloc& a, T* p, Args&&... args);
```

5 *Effects*: Calls `a.construct(p, std::forward<Args>(args)...)` if that call is well-formed; otherwise, invokes `construct_at(p, std::forward<Args>(args)...)`.

```
template<class T>
  static constexpr void destroy(Alloc& a, T* p);
```

6 *Effects*: Calls `a.destroy(p)` if that call is well-formed; otherwise, invokes `destroy_at(p)`.

```
static constexpr size_type max_size(const Alloc& a) noexcept;
```

7 *Returns*: `a.max_size()` if that expression is well-formed; otherwise, `numeric_limits<size_type>::max()/sizeof(value_type)`.

```
static constexpr Alloc select_on_container_copy_construction(const Alloc& rhs);
```

8 *Returns*: `rhs.select_on_container_copy_construction()` if that expression is well-formed; otherwise, `rhs`.

20.10.10 The default allocator [default.allocator]

20.10.10.1 General [default.allocator.general]

1 All specializations of the default allocator meet the allocator completeness requirements (16.4.4.6.2).

```
namespace std {
  template<class T> class allocator {
   public:
    using value_type                             = T;
    using size_type                              = size_t;
    using difference_type                        = ptrdiff_t;
    using propagate_on_container_move_assignment = true_type;
    using is_always_equal                        = true_type;

    constexpr allocator() noexcept;
    constexpr allocator(const allocator&) noexcept;
    template<class U> constexpr allocator(const allocator<U>&) noexcept;
    constexpr ~allocator();
    constexpr allocator& operator=(const allocator&) = default;

    [[nodiscard]] constexpr T* allocate(size_t n);
    constexpr void deallocate(T* p, size_t n);
  };
}
```

20.10.10.2 Members [allocator.members]

1 Except for the destructor, member functions of the default allocator shall not introduce data races (6.9.2) as a result of concurrent calls to those member functions from different threads. Calls to these functions that allocate or deallocate a particular unit of storage shall occur in a single total order, and each such deallocation call shall happen before the next allocation (if any) in this order.

```
[[nodiscard]] constexpr T* allocate(size_t n);
```

2 *Mandates*: `T` is not an incomplete type (6.8).

3 *Returns*: A pointer to the initial element of an array of `n` `T`.

4 *Throws*: `bad_array_new_length` if `numeric_limits<size_t>::max() / sizeof(T) < n`, or `bad_alloc` if the storage cannot be obtained.

5 *Remarks*: The storage for the array is obtained by calling `::operator new` (17.6.3), but it is unspecified when or how often this function is called. This function starts the lifetime of the array object, but not that of any of the array elements.

```
constexpr void deallocate(T* p, size_t n);
```

6 *Preconditions*: `p` is a pointer value obtained from `allocate()`. `n` equals the value passed as the first argument to the invocation of allocate which returned `p`.

7 *Effects*: Deallocates the storage referenced by `p`.

8 *Remarks*: Uses `::operator delete` (17.6.3), but it is unspecified when this function is called.

20.10.10.3 Operators [allocator.globals]

```
template<class T, class U>
  constexpr bool operator==(const allocator<T>&, const allocator<U>&) noexcept;
```

1 *Returns*: `true`.

20.10.11 `addressof` [specialized.addressof]

```
template<class T> constexpr T* addressof(T& r) noexcept;
```

1 *Returns*: The actual address of the object or function referenced by `r`, even in the presence of an overloaded `operator&`.

2 *Remarks*: An expression `addressof(E)` is a constant subexpression (3.14) if `E` is an lvalue constant subexpression.

20.10.12 C library memory allocation [c.malloc]

1 [*Note 1*: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — *end note*]

```
void* aligned_alloc(size_t alignment, size_t size);
void* calloc(size_t nmemb, size_t size);
void* malloc(size_t size);
void* realloc(void* ptr, size_t size);
```

2 *Effects*: These functions have the semantics specified in the C standard library.

3 *Remarks*: These functions do not attempt to allocate storage by calling `::operator new()` (17.6.3).

4 Storage allocated directly with these functions is implicitly declared reachable (see 6.7.5.5.4) on allocation, ceases to be declared reachable on deallocation, and need not cease to be declared reachable as the result of an `undeclare_reachable()` call.

[*Note 2*: This allows existing C libraries to remain unaffected by restrictions on pointers that are not safely derived, at the expense of providing far fewer garbage collection and leak detection options for `malloc()`-allocated objects. It also allows `malloc()` to be implemented with a separate allocation arena, bypassing the normal `declare_reachable()` implementation. — *end note*]

5 These functions implicitly create objects (6.7.2) in the returned region of storage and return a pointer to a suitable created object. In the case of `calloc` and `realloc`, the objects are created before the storage is zeroed or copied, respectively.

```
void free(void* ptr);
```

6 *Effects*: This function has the semantics specified in the C standard library.

7 *Remarks*: This function does not attempt to deallocate storage by calling `::operator delete()`.

SEE ALSO: ISO C 7.22.3

20.11 Smart pointers [smartptr]

20.11.1 Class template `unique_ptr` [unique.ptr]

20.11.1.1 General [unique.ptr.general]

1 A *unique pointer* is an object that owns another object and manages that other object through a pointer. More precisely, a unique pointer is an object u that stores a pointer to a second object p and will dispose of p when u is itself destroyed (e.g., when leaving block scope (8.8)). In this context, u is said to *own* `p`.

2 The mechanism by which u disposes of p is known as p's associated *deleter*, a function object whose correct invocation results in p's appropriate disposition (typically its deletion).

3 Let the notation $u.p$ denote the pointer stored by u, and let $u.d$ denote the associated deleter. Upon request, u can *reset* (replace) $u.p$ and $u.d$ with another pointer and deleter, but properly disposes of its owned object via the associated deleter before such replacement is considered completed.

4 Each object of a type `U` instantiated from the `unique_ptr` template specified in 20.11.1 has the strict ownership semantics, specified above, of a unique pointer. In partial satisfaction of these semantics, each such `U` is *Cpp17MoveConstructible* and *Cpp17MoveAssignable*, but is not *Cpp17CopyConstructible* nor *Cpp17CopyAssignable*. The template parameter `T` of `unique_ptr` may be an incomplete type.

5 [*Note 1*: The uses of `unique_ptr` include providing exception safety for dynamically allocated memory, passing ownership of dynamically allocated memory to a function, and returning dynamically allocated memory from a function. — *end note*]

20.11.1.2 Default deleters [unique.ptr.dltr]

20.11.1.2.1 In general [unique.ptr.dltr.general]

1 The class template `default_delete` serves as the default deleter (destruction policy) for the class template `unique_ptr`.

2 The template parameter `T` of `default_delete` may be an incomplete type.

20.11.1.2.2 `default_delete` [unique.ptr.dltr.dflt]

```
namespace std {
  template<class T> struct default_delete {
    constexpr default_delete() noexcept = default;
    template<class U> default_delete(const default_delete<U>&) noexcept;
    void operator()(T*) const;
  };
}
```

```
template<class U> default_delete(const default_delete<U>& other) noexcept;
```

1 *Constraints*: `U*` is implicitly convertible to `T*`.

2 *Effects*: Constructs a `default_delete` object from another `default_delete<U>` object.

```
void operator()(T* ptr) const;
```

3 *Mandates*: `T` is a complete type.

4 *Effects*: Calls `delete` on `ptr`.

20.11.1.2.3 `default_delete<T[]>` [unique.ptr.dltr.dflt1]

```
namespace std {
  template<class T> struct default_delete<T[]> {
    constexpr default_delete() noexcept = default;
    template<class U> default_delete(const default_delete<U[]>&) noexcept;
    template<class U> void operator()(U* ptr) const;
  };
}
```

```
template<class U> default_delete(const default_delete<U[]>& other) noexcept;
```

1 *Constraints*: `U(*)[]` is convertible to `T(*)[]`.

2 *Effects*: Constructs a `default_delete` object from another `default_delete<U[]>` object.

```
template<class U> void operator()(U* ptr) const;
```

3 *Constraints*: `U(*)[]` is convertible to `T(*)[]`.

4 *Mandates*: `U` is a complete type.

5 *Effects*: Calls `delete[]` on `ptr`.

20.11.1.3 `unique_ptr` for single objects [unique.ptr.single]

20.11.1.3.1 General [unique.ptr.single.general]

```
namespace std {
  template<class T, class D = default_delete<T>> class unique_ptr {
  public:
    using pointer      = see below;
    using element_type = T;
    using deleter_type = D;

    // 20.11.1.3.2, constructors
    constexpr unique_ptr() noexcept;
    explicit unique_ptr(pointer p) noexcept;
    unique_ptr(pointer p, see below d1) noexcept;
```

```
    unique_ptr(pointer p, see below d2) noexcept;
    unique_ptr(unique_ptr&& u) noexcept;
    constexpr unique_ptr(nullptr_t) noexcept;
    template<class U, class E>
      unique_ptr(unique_ptr<U, E>&& u) noexcept;

    // 20.11.1.3.3, destructor
    ~unique_ptr();

    // 20.11.1.3.4, assignment
    unique_ptr& operator=(unique_ptr&& u) noexcept;
    template<class U, class E>
      unique_ptr& operator=(unique_ptr<U, E>&& u) noexcept;
    unique_ptr& operator=(nullptr_t) noexcept;

    // 20.11.1.3.5, observers
    add_lvalue_reference_t<T> operator*() const;
    pointer operator->() const noexcept;
    pointer get() const noexcept;
    deleter_type& get_deleter() noexcept;
    const deleter_type& get_deleter() const noexcept;
    explicit operator bool() const noexcept;

    // 20.11.1.3.6, modifiers
    pointer release() noexcept;
    void reset(pointer p = pointer()) noexcept;
    void swap(unique_ptr& u) noexcept;

    // disable copy from lvalue
    unique_ptr(const unique_ptr&) = delete;
    unique_ptr& operator=(const unique_ptr&) = delete;
  };
}
```

1 The default type for the template parameter `D` is `default_delete`. A client-supplied template argument `D` shall be a function object type (20.14), lvalue reference to function, or lvalue reference to function object type for which, given a value `d` of type `D` and a value `ptr` of type `unique_ptr<T, D>::pointer`, the expression `d(ptr)` is valid and has the effect of disposing of the pointer as appropriate for that deleter.

2 If the deleter's type `D` is not a reference type, `D` shall meet the *Cpp17Destructible* requirements (Table 32).

3 If the *qualified-id* `remove_reference_t<D>::pointer` is valid and denotes a type (13.10.3), then `unique_ptr<T, D>::pointer` shall be a synonym for `remove_reference_t<D>::pointer`. Otherwise `unique_ptr<T, D>::pointer` shall be a synonym for `element_type*`. The type `unique_ptr<T, D>::pointer` shall meet the *Cpp17NullablePointer* requirements (Table 33).

4 [*Example 1*: Given an allocator type `X` (Table 36) and letting `A` be a synonym for `allocator_traits<X>`, the types `A::pointer`, `A::const_pointer`, `A::void_pointer`, and `A::const_void_pointer` may be used as `unique_ptr<T, D>::pointer`. — *end example*]

20.11.1.3.2 Constructors [unique.ptr.single.ctor]

```
constexpr unique_ptr() noexcept;
constexpr unique_ptr(nullptr_t) noexcept;
```

1 *Constraints*: `is_pointer_v<deleter_type>` is `false` and `is_default_constructible_v<deleter_type>` is `true`.

2 *Preconditions*: `D` meets the *Cpp17DefaultConstructible* requirements (Table 27), and that construction does not throw an exception.

3 *Effects*: Constructs a `unique_ptr` object that owns nothing, value-initializing the stored pointer and the stored deleter.

4 *Postconditions*: `get() == nullptr`. `get_deleter()` returns a reference to the stored deleter.

```
explicit unique_ptr(pointer p) noexcept;
```

5 *Constraints*: `is_pointer_v<deleter_type>` is `false` and `is_default_constructible_v<deleter_type>` is `true`.

6 *Mandates*: This constructor is not selected by class template argument deduction (12.4.2.9).

7 *Preconditions*: `D` meets the *Cpp17DefaultConstructible* requirements (Table 27), and that construction does not throw an exception.

8 *Effects*: Constructs a `unique_ptr` which owns `p`, initializing the stored pointer with `p` and value-initializing the stored deleter.

9 *Postconditions*: `get() == p`. `get_deleter()` returns a reference to the stored deleter.

```
unique_ptr(pointer p, const D& d) noexcept;
unique_ptr(pointer p, remove_reference_t<D>&& d) noexcept;
```

10 *Constraints*: `is_constructible_v<D, decltype(d)>` is `true`.

11 *Mandates*: These constructors are not selected by class template argument deduction (12.4.2.9).

12 *Preconditions*: For the first constructor, if `D` is not a reference type, `D` meets the *Cpp17CopyConstructible* requirements and such construction does not exit via an exception. For the second constructor, if `D` is not a reference type, `D` meets the *Cpp17MoveConstructible* requirements and such construction does not exit via an exception.

13 *Effects*: Constructs a `unique_ptr` object which owns `p`, initializing the stored pointer with `p` and initializing the deleter from `std::forward<decltype(d)>(d)`.

14 *Postconditions*: `get() == p`. `get_deleter()` returns a reference to the stored deleter. If `D` is a reference type then `get_deleter()` returns a reference to the lvalue `d`.

15 *Remarks*: If `D` is a reference type, the second constructor is defined as deleted.

16 [*Example 1*:

```
D d;
unique_ptr<int, D> p1(new int, D());            // D must be Cpp17MoveConstructible
unique_ptr<int, D> p2(new int, d);              // D must be Cpp17CopyConstructible
unique_ptr<int, D&> p3(new int, d);             // p3 holds a reference to d
unique_ptr<int, const D&> p4(new int, D());     // error: rvalue deleter object combined
                                                // with reference deleter type
```

— *end example*]

```
unique_ptr(unique_ptr&& u) noexcept;
```

17 *Constraints*: `is_move_constructible_v<D>` is `true`.

18 *Preconditions*: If `D` is not a reference type, `D` meets the *Cpp17MoveConstructible* requirements (Table 28). Construction of the deleter from an rvalue of type `D` does not throw an exception.

19 *Effects*: Constructs a `unique_ptr` from `u`. If `D` is a reference type, this deleter is copy constructed from `u`'s deleter; otherwise, this deleter is move constructed from `u`'s deleter.

[*Note 1*: The construction of the deleter can be implemented with `std::forward<D>`. — *end note*]

20 *Postconditions*: `get()` yields the value `u.get()` yielded before the construction. `u.get() == nullptr`. `get_deleter()` returns a reference to the stored deleter that was constructed from `u.get_deleter()`. If `D` is a reference type then `get_deleter()` and `u.get_deleter()` both reference the same lvalue deleter.

```
template<class U, class E> unique_ptr(unique_ptr<U, E>&& u) noexcept;
```

21 *Constraints*:

(21.1) — `unique_ptr<U, E>::pointer` is implicitly convertible to `pointer`,

(21.2) — `U` is not an array type, and

(21.3) — either `D` is a reference type and `E` is the same type as `D`, or `D` is not a reference type and `E` is implicitly convertible to `D`.

22 *Preconditions*: If `E` is not a reference type, construction of the deleter from an rvalue of type `E` is well-formed and does not throw an exception. Otherwise, `E` is a reference type and construction of the deleter from an lvalue of type `E` is well-formed and does not throw an exception.

23 *Effects*: Constructs a `unique_ptr` from `u`. If `E` is a reference type, this deleter is copy constructed from `u`'s deleter; otherwise, this deleter is move constructed from `u`'s deleter.

[*Note 2*: The deleter constructor can be implemented with `std::forward<E>`. — *end note*]

24 *Postconditions*: `get()` yields the value `u.get()` yielded before the construction. `u.get() == nullptr`. `get_deleter()` returns a reference to the stored deleter that was constructed from `u.get_deleter()`.

20.11.1.3.3 Destructor [unique.ptr.single.dtor]

```
~unique_ptr();
```

1 *Preconditions*: The expression `get_deleter()(get())` is well-formed, has well-defined behavior, and does not throw exceptions.

[*Note 1*: The use of `default_delete` requires `T` to be a complete type. — *end note*]

2 *Effects*: If `get() == nullptr` there are no effects. Otherwise `get_deleter()(get())`.

20.11.1.3.4 Assignment [unique.ptr.single.asgn]

```
unique_ptr& operator=(unique_ptr&& u) noexcept;
```

1 *Constraints*: `is_move_assignable_v<D>` is `true`.

2 *Preconditions*: If `D` is not a reference type, `D` meets the *Cpp17MoveAssignable* requirements (Table 30) and assignment of the deleter from an rvalue of type `D` does not throw an exception. Otherwise, `D` is a reference type; `remove_reference_t<D>` meets the *Cpp17CopyAssignable* requirements and assignment of the deleter from an lvalue of type `D` does not throw an exception.

3 *Effects*: Calls `reset(u.release())` followed by `get_deleter() = std::forward<D>(u.get_deleter())`.

4 *Postconditions*: `u.get() == nullptr`.

5 *Returns*: `*this`.

```
template<class U, class E> unique_ptr& operator=(unique_ptr<U, E>&& u) noexcept;
```

6 *Constraints*:

(6.1) — `unique_ptr<U, E>::pointer` is implicitly convertible to `pointer`, and

(6.2) — `U` is not an array type, and

(6.3) — `is_assignable_v<D&, E&&>` is `true`.

7 *Preconditions*: If `E` is not a reference type, assignment of the deleter from an rvalue of type `E` is well-formed and does not throw an exception. Otherwise, `E` is a reference type and assignment of the deleter from an lvalue of type `E` is well-formed and does not throw an exception.

8 *Effects*: Calls `reset(u.release())` followed by `get_deleter() = std::forward<E>(u.get_deleter())`.

9 *Postconditions*: `u.get() == nullptr`.

10 *Returns*: `*this`.

```
unique_ptr& operator=(nullptr_t) noexcept;
```

11 *Effects*: As if by `reset()`.

12 *Postconditions*: `get() == nullptr`.

13 *Returns*: `*this`.

20.11.1.3.5 Observers [unique.ptr.single.observers]

```
add_lvalue_reference_t<T> operator*() const;
```

1 *Preconditions*: `get() != nullptr`.

2 *Returns*: `*get()`.

```
pointer operator->() const noexcept;
```

3 *Preconditions*: `get() != nullptr`.

4 *Returns*: `get()`.

5 [*Note 1*: The use of this function typically requires that `T` be a complete type. — *end note*]

```
pointer get() const noexcept;
```

6 *Returns*: The stored pointer.

```
deleter_type& get_deleter() noexcept;
const deleter_type& get_deleter() const noexcept;
```

7 *Returns*: A reference to the stored deleter.

```
explicit operator bool() const noexcept;
```

8 *Returns*: `get() != nullptr`.

20.11.1.3.6 Modifiers [unique.ptr.single.modifiers]

```
pointer release() noexcept;
```

1 *Postconditions*: `get() == nullptr`.

2 *Returns*: The value `get()` had at the start of the call to `release`.

```
void reset(pointer p = pointer()) noexcept;
```

3 *Preconditions*: The expression `get_deleter()(get())` is well-formed, has well-defined behavior, and does not throw exceptions.

4 *Effects*: Assigns `p` to the stored pointer, and then if and only if the old value of the stored pointer, `old_p`, was not equal to `nullptr`, calls `get_deleter()(old_p)`.

[*Note 1*: The order of these operations is significant because the call to `get_deleter()` might destroy `*this`. — *end note*]

5 *Postconditions*: `get() == p`.

[*Note 2*: The postcondition does not hold if the call to `get_deleter()` destroys `*this` since `this->get()` is no longer a valid expression. — *end note*]

```
void swap(unique_ptr& u) noexcept;
```

6 *Preconditions*: `get_deleter()` is swappable (16.4.4.3) and does not throw an exception under `swap`.

7 *Effects*: Invokes `swap` on the stored pointers and on the stored deleters of `*this` and `u`.

20.11.1.4 `unique_ptr` for array objects with a runtime length [unique.ptr.runtime]

20.11.1.4.1 General [unique.ptr.runtime.general]

```
namespace std {
  template<class T, class D> class unique_ptr<T[], D> {
  public:
    using pointer      = see below;
    using element_type = T;
    using deleter_type = D;

    // 20.11.1.4.2, constructors
    constexpr unique_ptr() noexcept;
    template<class U> explicit unique_ptr(U p) noexcept;
    template<class U> unique_ptr(U p, see below d) noexcept;
    template<class U> unique_ptr(U p, see below d) noexcept;
    unique_ptr(unique_ptr&& u) noexcept;
    template<class U, class E>
      unique_ptr(unique_ptr<U, E>&& u) noexcept;
    constexpr unique_ptr(nullptr_t) noexcept;

    // destructor
    ~unique_ptr();
```

```
    // assignment
    unique_ptr& operator=(unique_ptr&& u) noexcept;
    template<class U, class E>
      unique_ptr& operator=(unique_ptr<U, E>&& u) noexcept;
    unique_ptr& operator=(nullptr_t) noexcept;

    // 20.11.1.4.4, observers
    T& operator[](size_t i) const;
    pointer get() const noexcept;
    deleter_type& get_deleter() noexcept;
    const deleter_type& get_deleter() const noexcept;
    explicit operator bool() const noexcept;

    // 20.11.1.4.5, modifiers
    pointer release() noexcept;
    template<class U> void reset(U p) noexcept;
    void reset(nullptr_t = nullptr) noexcept;
    void swap(unique_ptr& u) noexcept;

    // disable copy from lvalue
    unique_ptr(const unique_ptr&) = delete;
    unique_ptr& operator=(const unique_ptr&) = delete;
  };
}
```

1 A specialization for array types is provided with a slightly altered interface.

(1.1) — Conversions between different types of `unique_ptr<T[], D>` that would be disallowed for the corresponding pointer-to-array types, and conversions to or from the non-array forms of `unique_ptr`, produce an ill-formed program.

(1.2) — Pointers to types derived from `T` are rejected by the constructors, and by `reset`.

(1.3) — The observers `operator*` and `operator->` are not provided.

(1.4) — The indexing observer `operator[]` is provided.

(1.5) — The default deleter will call `delete[]`.

2 Descriptions are provided below only for members that differ from the primary template.

3 The template argument `T` shall be a complete type.

20.11.1.4.2 Constructors [unique.ptr.runtime.ctor]

`template<class U> explicit unique_ptr(U p) noexcept;`

1 This constructor behaves the same as the constructor in the primary template that takes a single parameter of type `pointer`.

2 *Constraints*:

(2.1) — `U` is the same type as `pointer`, or

(2.2) — `pointer` is the same type as `element_type*`, `U` is a pointer type `V*`, and `V(*)[]` is convertible to `element_type(*)[]`.

```
template<class U> unique_ptr(U p, see below d) noexcept;
template<class U> unique_ptr(U p, see below d) noexcept;
```

3 These constructors behave the same as the constructors in the primary template that take a parameter of type `pointer` and a second parameter.

4 *Constraints*:

(4.1) — `U` is the same type as `pointer`,

(4.2) — `U` is `nullptr_t`, or

(4.3) — `pointer` is the same type as `element_type*`, `U` is a pointer type `V*`, and `V(*)[]` is convertible to `element_type(*)[]`.

```
template<class U, class E> unique_ptr(unique_ptr<U, E>&& u) noexcept;
```

5 This constructor behaves the same as in the primary template.

6 *Constraints*: Where `UP` is `unique_ptr<U, E>`:

(6.1) — `U` is an array type, and

(6.2) — `pointer` is the same type as `element_type*`, and

(6.3) — `UP::pointer` is the same type as `UP::element_type*`, and

(6.4) — `UP::element_type(*)[]` is convertible to `element_type(*)[]`, and

(6.5) — either `D` is a reference type and `E` is the same type as `D`, or `D` is not a reference type and `E` is implicitly convertible to `D`.

[*Note 1*: This replaces the *Constraints*: specification of the primary template. — *end note*]

20.11.1.4.3 Assignment [unique.ptr.runtime.asgn]

```
template<class U, class E> unique_ptr& operator=(unique_ptr<U, E>&& u) noexcept;
```

1 This operator behaves the same as in the primary template.

2 *Constraints*: Where `UP` is `unique_ptr<U, E>`:

(2.1) — `U` is an array type, and

(2.2) — `pointer` is the same type as `element_type*`, and

(2.3) — `UP::pointer` is the same type as `UP::element_type*`, and

(2.4) — `UP::element_type(*)[]` is convertible to `element_type(*)[]`, and

(2.5) — `is_assignable_v<D&, E&&>` is `true`.

[*Note 1*: This replaces the *Constraints*: specification of the primary template. — *end note*]

20.11.1.4.4 Observers [unique.ptr.runtime.observers]

```
T& operator[](size_t i) const;
```

1 *Preconditions*: `i` < the number of elements in the array to which the stored pointer points.

2 *Returns*: `get()[i]`.

20.11.1.4.5 Modifiers [unique.ptr.runtime.modifiers]

```
void reset(nullptr_t p = nullptr) noexcept;
```

1 *Effects*: Equivalent to `reset(pointer())`.

```
template<class U> void reset(U p) noexcept;
```

2 This function behaves the same as the `reset` member of the primary template.

3 *Constraints*:

(3.1) — `U` is the same type as `pointer`, or

(3.2) — `pointer` is the same type as `element_type*`, `U` is a pointer type `V*`, and `V(*)[]` is convertible to `element_type(*)[]`.

20.11.1.5 Creation [unique.ptr.create]

```
template<class T, class... Args> unique_ptr<T> make_unique(Args&&... args);
```

1 *Constraints*: `T` is not an array type.

2 *Returns*: `unique_ptr<T>(new T(std::forward<Args>(args)...))`.

```
template<class T> unique_ptr<T> make_unique(size_t n);
```

3 *Constraints*: `T` is an array of unknown bound.

4 *Returns*: `unique_ptr<T>(new remove_extent_t<T>[n]())`.

```
template<class T, class... Args> unspecified make_unique(Args&&...) = delete;
```

5 *Constraints*: `T` is an array of known bound.

```
template<class T> unique_ptr<T> make_unique_for_overwrite();
```

6 *Constraints*: `T` is not an array type.

7 *Returns*: `unique_ptr<T>(new T)`.

```
template<class T> unique_ptr<T> make_unique_for_overwrite(size_t n);
```

8 *Constraints*: `T` is an array of unknown bound.

9 *Returns*: `unique_ptr<T>(new remove_extent_t<T>[n])`.

```
template<class T, class... Args> unspecified make_unique_for_overwrite(Args&&...) = delete;
```

10 *Constraints*: `T` is an array of known bound.

20.11.1.6 Specialized algorithms [unique.ptr.special]

```
template<class T, class D> void swap(unique_ptr<T, D>& x, unique_ptr<T, D>& y) noexcept;
```

1 *Constraints*: `is_swappable_v<D>` is `true`.

2 *Effects*: Calls `x.swap(y)`.

```
template<class T1, class D1, class T2, class D2>
  bool operator==(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

3 *Returns*: `x.get() == y.get()`.

```
template<class T1, class D1, class T2, class D2>
  bool operator<(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

4 Let `CT` denote

```
common_type_t<typename unique_ptr<T1, D1>::pointer,
              typename unique_ptr<T2, D2>::pointer>
```

5 *Mandates*:

(5.1) — `unique_ptr<T1, D1>::pointer` is implicitly convertible to `CT` and

(5.2) — `unique_ptr<T2, D2>::pointer` is implicitly convertible to `CT`.

6 *Preconditions*: The specialization `less<CT>` is a function object type (20.14) that induces a strict weak ordering (25.8) on the pointer values.

7 *Returns*: `less<CT>()(x.get(), y.get())`.

```
template<class T1, class D1, class T2, class D2>
  bool operator>(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

8 *Returns*: `y < x`.

```
template<class T1, class D1, class T2, class D2>
  bool operator<=(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

9 *Returns*: `!(y < x)`.

```
template<class T1, class D1, class T2, class D2>
  bool operator>=(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

10 *Returns*: `!(x < y)`.

```
template<class T1, class D1, class T2, class D2>
  requires three_way_comparable_with<typename unique_ptr<T1, D1>::pointer,
                                     typename unique_ptr<T2, D2>::pointer>
  compare_three_way_result_t<typename unique_ptr<T1, D1>::pointer,
                             typename unique_ptr<T2, D2>::pointer>
    operator<=>(const unique_ptr<T1, D1>& x, const unique_ptr<T2, D2>& y);
```

11 *Returns*: `compare_three_way()(x.get(), y.get())`.

```
template<class T, class D>
  bool operator==(const unique_ptr<T, D>& x, nullptr_t) noexcept;
```

12 *Returns*: `!x`.

```
template<class T, class D>
  bool operator<(const unique_ptr<T, D>& x, nullptr_t);
template<class T, class D>
  bool operator<(nullptr_t, const unique_ptr<T, D>& x);
```

13 *Preconditions*: The specialization `less<unique_ptr<T, D>::pointer>` is a function object type (20.14) that induces a strict weak ordering (25.8) on the pointer values.

14 *Returns*: The first function template returns

```
less<unique_ptr<T, D>::pointer>()(x.get(), nullptr)
```

The second function template returns

```
less<unique_ptr<T, D>::pointer>()(nullptr, x.get())
```

```
template<class T, class D>
  bool operator>(const unique_ptr<T, D>& x, nullptr_t);
template<class T, class D>
  bool operator>(nullptr_t, const unique_ptr<T, D>& x);
```

15 *Returns*: The first function template returns `nullptr < x`. The second function template returns `x < nullptr`.

```
template<class T, class D>
  bool operator<=(const unique_ptr<T, D>& x, nullptr_t);
template<class T, class D>
  bool operator<=(nullptr_t, const unique_ptr<T, D>& x);
```

16 *Returns*: The first function template returns `!(nullptr < x)`. The second function template returns `!(x < nullptr)`.

```
template<class T, class D>
  bool operator>=(const unique_ptr<T, D>& x, nullptr_t);
template<class T, class D>
  bool operator>=(nullptr_t, const unique_ptr<T, D>& x);
```

17 *Returns*: The first function template returns `!(x < nullptr)`. The second function template returns `!(nullptr < x)`.

```
template<class T, class D>
  requires three_way_comparable_with<typename unique_ptr<T, D>::pointer, nullptr_t>
  compare_three_way_result_t<typename unique_ptr<T, D>::pointer, nullptr_t>
    operator<=>(const unique_ptr<T, D>& x, nullptr_t);
```

18 *Returns*: `compare_three_way()(x.get(), nullptr)`.

20.11.1.7 I/O [unique.ptr.io]

```
template<class E, class T, class Y, class D>
  basic_ostream<E, T>& operator<<(basic_ostream<E, T>& os, const unique_ptr<Y, D>& p);
```

1 *Constraints*: `os << p.get()` is a valid expression.

2 *Effects*: Equivalent to: `os << p.get();`

3 *Returns*: `os`.

20.11.2 Class `bad_weak_ptr` [util.smartptr.weak.bad]

```
namespace std {
  class bad_weak_ptr : public exception {
  public:
    // see 17.9.3 for the specification of the special member functions
    const char* what() const noexcept override;
  };
}
```

1 An exception of type `bad_weak_ptr` is thrown by the `shared_ptr` constructor taking a `weak_ptr`.

```
const char* what() const noexcept override;
```

2 *Returns*: An implementation-defined NTBS.

20.11.3 Class template shared_ptr [util.smartptr.shared]

20.11.3.1 General [util.smartptr.shared.general]

1 The `shared_ptr` class template stores a pointer, usually obtained via `new`. `shared_ptr` implements semantics of shared ownership; the last remaining owner of the pointer is responsible for destroying the object, or otherwise releasing the resources associated with the stored pointer. A `shared_ptr` is said to be empty if it does not own a pointer.

```
namespace std {
  template<class T> class shared_ptr {
  public:
    using element_type = remove_extent_t<T>;
    using weak_type    = weak_ptr<T>;

    // 20.11.3.2, constructors
    constexpr shared_ptr() noexcept;
    constexpr shared_ptr(nullptr_t) noexcept : shared_ptr() { }
    template<class Y>
      explicit shared_ptr(Y* p);
    template<class Y, class D>
      shared_ptr(Y* p, D d);
    template<class Y, class D, class A>
      shared_ptr(Y* p, D d, A a);
    template<class D>
      shared_ptr(nullptr_t p, D d);
    template<class D, class A>
      shared_ptr(nullptr_t p, D d, A a);
    template<class Y>
      shared_ptr(const shared_ptr<Y>& r, element_type* p) noexcept;
    template<class Y>
      shared_ptr(shared_ptr<Y>&& r, element_type* p) noexcept;
    shared_ptr(const shared_ptr& r) noexcept;
    template<class Y>
      shared_ptr(const shared_ptr<Y>& r) noexcept;
    shared_ptr(shared_ptr&& r) noexcept;
    template<class Y>
      shared_ptr(shared_ptr<Y>&& r) noexcept;
    template<class Y>
      explicit shared_ptr(const weak_ptr<Y>& r);
    template<class Y, class D>
      shared_ptr(unique_ptr<Y, D>&& r);

    // 20.11.3.3, destructor
    ~shared_ptr();

    // 20.11.3.4, assignment
    shared_ptr& operator=(const shared_ptr& r) noexcept;
    template<class Y>
      shared_ptr& operator=(const shared_ptr<Y>& r) noexcept;
    shared_ptr& operator=(shared_ptr&& r) noexcept;
    template<class Y>
      shared_ptr& operator=(shared_ptr<Y>&& r) noexcept;
    template<class Y, class D>
      shared_ptr& operator=(unique_ptr<Y, D>&& r);

    // 20.11.3.5, modifiers
    void swap(shared_ptr& r) noexcept;
    void reset() noexcept;
    template<class Y>
      void reset(Y* p);
    template<class Y, class D>
      void reset(Y* p, D d);
    template<class Y, class D, class A>
      void reset(Y* p, D d, A a);
```

```
    // 20.11.3.6, observers
    element_type* get() const noexcept;
    T& operator*() const noexcept;
    T* operator->() const noexcept;
    element_type& operator[](ptrdiff_t i) const;
    long use_count() const noexcept;
    explicit operator bool() const noexcept;
    template<class U>
      bool owner_before(const shared_ptr<U>& b) const noexcept;
    template<class U>
      bool owner_before(const weak_ptr<U>& b) const noexcept;
  };

  template<class T>
    shared_ptr(weak_ptr<T>) -> shared_ptr<T>;
  template<class T, class D>
    shared_ptr(unique_ptr<T, D>) -> shared_ptr<T>;
}
```

2 Specializations of `shared_ptr` shall be *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17LessThanComparable*, allowing their use in standard containers. Specializations of `shared_ptr` shall be contextually convertible to `bool`, allowing their use in boolean expressions and declarations in conditions.

3 The template parameter `T` of `shared_ptr` may be an incomplete type.

[*Note 1*: `T` can be a function type. — *end note*]

4 [*Example 1*:

```
if (shared_ptr<X> px = dynamic_pointer_cast<X>(py)) {
  // do something with px
}
```

— *end example*]

5 For purposes of determining the presence of a data race, member functions shall access and modify only the `shared_ptr` and `weak_ptr` objects themselves and not objects they refer to. Changes in `use_count()` do not reflect modifications that can introduce data races.

6 For the purposes of subclause 20.11, a pointer type `Y*` is said to be *compatible with* a pointer type `T*` when either `Y*` is convertible to `T*` or `Y` is `U[N]` and `T` is *cv* `U[]`.

20.11.3.2 Constructors [util.smartptr.shared.const]

1 In the constructor definitions below, enables `shared_from_this` with `p`, for a pointer `p` of type `Y*`, means that if `Y` has an unambiguous and accessible base class that is a specialization of `enable_shared_from_this` (20.11.6), then `remove_cv_t<Y>*` shall be implicitly convertible to `T*` and the constructor evaluates the statement:

```
if (p != nullptr && p->weak_this.expired())
  p->weak_this = shared_ptr<remove_cv_t<Y>>(*this, const_cast<remove_cv_t<Y>*>(p));
```

The assignment to the `weak_this` member is not atomic and conflicts with any potentially concurrent access to the same object (6.9.2).

```
constexpr shared_ptr() noexcept;
```

2 *Postconditions*: `use_count() == 0 && get() == nullptr`.

```
template<class Y> explicit shared_ptr(Y* p);
```

3 *Mandates*: `Y` is a complete type.

4 *Constraints*: When `T` is an array type, the expression `delete[] p` is well-formed and either `T` is `U[N]` and `Y(*)[N]` is convertible to `T*`, or `T` is `U[]` and `Y(*)[]` is convertible to `T*`. When `T` is not an array type, the expression `delete p` is well-formed and `Y*` is convertible to `T*`.

5 *Preconditions*: The expression `delete[] p`, when `T` is an array type, or `delete p`, when `T` is not an array type, has well-defined behavior, and does not throw exceptions.

6 *Effects*: When `T` is not an array type, constructs a `shared_ptr` object that owns the pointer `p`. Otherwise, constructs a `shared_ptr` that owns `p` and a deleter of an unspecified type that calls `delete[] p`. When

T is not an array type, enables `shared_from_this` with `p`. If an exception is thrown, `delete p` is called when `T` is not an array type, `delete[] p` otherwise.

7 *Postconditions*: `use_count() == 1 && get() == p`.

8 *Throws*: `bad_alloc`, or an implementation-defined exception when a resource other than memory could not be obtained.

```
template<class Y, class D> shared_ptr(Y* p, D d);
template<class Y, class D, class A> shared_ptr(Y* p, D d, A a);
template<class D> shared_ptr(nullptr_t p, D d);
template<class D, class A> shared_ptr(nullptr_t p, D d, A a);
```

9 *Constraints*: `is_move_constructible_v<D>` is `true`, and `d(p)` is a well-formed expression. For the first two overloads:

(9.1) — If `T` is an array type, then either `T` is `U[N]` and `Y(*)[N]` is convertible to `T*`, or `T` is `U[]` and `Y(*)[]` is convertible to `T*`.

(9.2) — If `T` is not an array type, then `Y*` is convertible to `T*`.

10 *Preconditions*: Construction of `d` and a deleter of type `D` initialized with `std::move(d)` do not throw exceptions. The expression `d(p)` has well-defined behavior and does not throw exceptions. `A` meets the *Cpp17Allocator* requirements (Table 36).

11 *Effects*: Constructs a `shared_ptr` object that owns the object `p` and the deleter `d`. When `T` is not an array type, the first and second constructors enable `shared_from_this` with `p`. The second and fourth constructors shall use a copy of `a` to allocate memory for internal use. If an exception is thrown, `d(p)` is called.

12 *Postconditions*: `use_count() == 1 && get() == p`.

13 *Throws*: `bad_alloc`, or an implementation-defined exception when a resource other than memory could not be obtained.

```
template<class Y> shared_ptr(const shared_ptr<Y>& r, element_type* p) noexcept;
template<class Y> shared_ptr(shared_ptr<Y>&& r, element_type* p) noexcept;
```

14 *Effects*: Constructs a `shared_ptr` instance that stores `p` and shares ownership with the initial value of `r`.

15 *Postconditions*: `get() == p`. For the second overload, `r` is empty and `r.get() == nullptr`.

16 [*Note 1*: Use of this constructor leads to a dangling pointer unless `p` remains valid at least until the ownership group of `r` is destroyed. — *end note*]

17 [*Note 2*: This constructor allows creation of an empty `shared_ptr` instance with a non-null stored pointer. — *end note*]

```
shared_ptr(const shared_ptr& r) noexcept;
template<class Y> shared_ptr(const shared_ptr<Y>& r) noexcept;
```

18 *Constraints*: For the second constructor, `Y*` is compatible with `T*`.

19 *Effects*: If `r` is empty, constructs an empty `shared_ptr` object; otherwise, constructs a `shared_ptr` object that shares ownership with `r`.

20 *Postconditions*: `get() == r.get() && use_count() == r.use_count()`.

```
shared_ptr(shared_ptr&& r) noexcept;
template<class Y> shared_ptr(shared_ptr<Y>&& r) noexcept;
```

21 *Constraints*: For the second constructor, `Y*` is compatible with `T*`.

22 *Effects*: Move constructs a `shared_ptr` instance from `r`.

23 *Postconditions*: `*this` shall contain the old value of `r`. `r` shall be empty. `r.get() == nullptr`.

```
template<class Y> explicit shared_ptr(const weak_ptr<Y>& r);
```

24 *Constraints*: `Y*` is compatible with `T*`.

25 *Effects*: Constructs a `shared_ptr` object that shares ownership with `r` and stores a copy of the pointer stored in `r`. If an exception is thrown, the constructor has no effect.

26 *Postconditions*: `use_count() == r.use_count()`.

27 *Throws*: `bad_weak_ptr` when `r.expired()`.

```
template<class Y, class D> shared_ptr(unique_ptr<Y, D>&& r);
```

28 *Constraints*: `Y*` is compatible with `T*` and `unique_ptr<Y, D>::pointer` is convertible to `element_-type*`.

29 *Effects*: If `r.get() == nullptr`, equivalent to `shared_ptr()`. Otherwise, if `D` is not a reference type, equivalent to `shared_ptr(r.release(), r.get_deleter())`. Otherwise, equivalent to `shared_-ptr(r.release(), ref(r.get_deleter()))`. If an exception is thrown, the constructor has no effect.

20.11.3.3 Destructor [util.smartptr.shared.dest]

```
~shared_ptr();
```

1 *Effects*:

(1.1) — If `*this` is empty or shares ownership with another `shared_ptr` instance (`use_count() > 1`), there are no side effects.

(1.2) — Otherwise, if `*this` owns an object `p` and a deleter `d`, `d(p)` is called.

(1.3) — Otherwise, `*this` owns a pointer `p`, and `delete p` is called.

2 [*Note 1*: Since the destruction of `*this` decreases the number of instances that share ownership with `*this` by one, after `*this` has been destroyed all `shared_ptr` instances that shared ownership with `*this` will report a `use_count()` that is one less than its previous value. — *end note*]

20.11.3.4 Assignment [util.smartptr.shared.assign]

```
shared_ptr& operator=(const shared_ptr& r) noexcept;
template<class Y> shared_ptr& operator=(const shared_ptr<Y>& r) noexcept;
```

1 *Effects*: Equivalent to `shared_ptr(r).swap(*this)`.

2 *Returns*: `*this`.

3 [*Note 1*: The use count updates caused by the temporary object construction and destruction are not observable side effects, so the implementation can meet the effects (and the implied guarantees) via different means, without creating a temporary. In particular, in the example:

```
shared_ptr<int> p(new int);
shared_ptr<void> q(p);
p = p;
q = p;
```

both assignments can be no-ops. — *end note*]

```
shared_ptr& operator=(shared_ptr&& r) noexcept;
template<class Y> shared_ptr& operator=(shared_ptr<Y>&& r) noexcept;
```

4 *Effects*: Equivalent to `shared_ptr(std::move(r)).swap(*this)`.

5 *Returns*: `*this`.

```
template<class Y, class D> shared_ptr& operator=(unique_ptr<Y, D>&& r);
```

6 *Effects*: Equivalent to `shared_ptr(std::move(r)).swap(*this)`.

7 *Returns*: `*this`.

20.11.3.5 Modifiers [util.smartptr.shared.mod]

```
void swap(shared_ptr& r) noexcept;
```

1 *Effects*: Exchanges the contents of `*this` and `r`.

```
void reset() noexcept;
```

2 *Effects*: Equivalent to `shared_ptr().swap(*this)`.

```
template<class Y> void reset(Y* p);
```

3 *Effects*: Equivalent to `shared_ptr(p).swap(*this)`.

```
template<class Y, class D> void reset(Y* p, D d);
```

4 *Effects*: Equivalent to `shared_ptr(p, d).swap(*this)`.

```
template<class Y, class D, class A> void reset(Y* p, D d, A a);
```

5 *Effects*: Equivalent to `shared_ptr(p, d, a).swap(*this)`.

20.11.3.6 Observers [util.smartptr.shared.obs]

```
element_type* get() const noexcept;
```

1 *Returns*: The stored pointer.

```
T& operator*() const noexcept;
```

2 *Preconditions*: `get() != 0`.

3 *Returns*: `*get()`.

4 *Remarks*: When `T` is an array type or *cv* `void`, it is unspecified whether this member function is declared. If it is declared, it is unspecified what its return type is, except that the declaration (although not necessarily the definition) of the function shall be well-formed.

```
T* operator->() const noexcept;
```

5 *Preconditions*: `get() != 0`.

6 *Returns*: `get()`.

7 *Remarks*: When `T` is an array type, it is unspecified whether this member function is declared. If it is declared, it is unspecified what its return type is, except that the declaration (although not necessarily the definition) of the function shall be well-formed.

```
element_type& operator[](ptrdiff_t i) const;
```

8 *Preconditions*: `get() != 0 && i >= 0`. If `T` is `U[N]`, `i < N`.

9 *Returns*: `get()[i]`.

10 *Throws*: Nothing.

11 *Remarks*: When `T` is not an array type, it is unspecified whether this member function is declared. If it is declared, it is unspecified what its return type is, except that the declaration (although not necessarily the definition) of the function shall be well-formed.

```
long use_count() const noexcept;
```

12 *Returns*: The number of `shared_ptr` objects, `*this` included, that share ownership with `*this`, or `0` when `*this` is empty.

13 *Synchronization*: None.

14 [*Note 1*: `get() == nullptr` does not imply a specific return value of `use_count()`. — *end note*]

15 [*Note 2*: `weak_ptr<T>::lock()` can affect the return value of `use_count()`. — *end note*]

16 [*Note 3*: When multiple threads might affect the return value of `use_count()`, the result is approximate. In particular, `use_count() == 1` does not imply that accesses through a previously destroyed `shared_ptr` have in any sense completed. — *end note*]

```
explicit operator bool() const noexcept;
```

17 *Returns*: `get() != 0`.

```
template<class U> bool owner_before(const shared_ptr<U>& b) const noexcept;
template<class U> bool owner_before(const weak_ptr<U>& b) const noexcept;
```

18 *Returns*: An unspecified value such that

(18.1) — `x.owner_before(y)` defines a strict weak ordering as defined in 25.8;

(18.2) — under the equivalence relation defined by `owner_before`, `!a.owner_before(b) && !b.owner_before(a)`, two `shared_ptr` or `weak_ptr` instances are equivalent if and only if they share ownership or are both empty.

20.11.3.7 Creation [util.smartptr.shared.create]

1 The common requirements that apply to all `make_shared`, `allocate_shared`, `make_shared_for_overwrite`, and `allocate_shared_for_overwrite` overloads, unless specified otherwise, are described below.

```
template<class T, ...>
  shared_ptr<T> make_shared(args);
template<class T, class A, ...>
  shared_ptr<T> allocate_shared(const A& a, args);
template<class T, ...>
  shared_ptr<T> make_shared_for_overwrite(args);
template<class T, class A, ...>
  shared_ptr<T> allocate_shared_for_overwrite(const A& a, args);
```

2 *Preconditions*: `A` meets the *Cpp17Allocator* requirements (Table 36).

3 *Effects*: Allocates memory for an object of type `T` (or `U[N]` when `T` is `U[]`, where `N` is determined from *args* as specified by the concrete overload). The object is initialized from *args* as specified by the concrete overload. The `allocate_shared` and `allocate_shared_for_overwrite` templates use a copy of `a` (rebound for an unspecified `value_type`) to allocate memory. If an exception is thrown, the functions have no effect.

4 *Postconditions*: `r.get() != 0 && r.use_count() == 1`, where `r` is the return value.

5 *Returns*: A `shared_ptr` instance that stores and owns the address of the newly constructed object.

6 *Throws*: `bad_alloc`, or an exception thrown from `allocate` or from the initialization of the object.

7 *Remarks*:

(7.1) — Implementations should perform no more than one memory allocation.

[*Note 1*: This provides efficiency equivalent to an intrusive smart pointer. — *end note*]

(7.2) — When an object of an array type `U` is specified to have an initial value of `u` (of the same type), this shall be interpreted to mean that each array element of the object has as its initial value the corresponding element from `u`.

(7.3) — When an object of an array type is specified to have a default initial value, this shall be interpreted to mean that each array element of the object has a default initial value.

(7.4) — When a (sub)object of a non-array type `U` is specified to have an initial value of `v`, or `U(l...)`, where `l...` is a list of constructor arguments, `make_shared` shall initialize this (sub)object via the expression `::new(pv) U(v)` or `::new(pv) U(l...)` respectively, where `pv` has type `void*` and points to storage suitable to hold an object of type `U`.

(7.5) — When a (sub)object of a non-array type `U` is specified to have an initial value of `v`, or `U(l...)`, where `l...` is a list of constructor arguments, `allocate_shared` shall initialize this (sub)object via the expression

(7.5.1) — `allocator_traits<A2>::construct(a2, pv, v)` or

(7.5.2) — `allocator_traits<A2>::construct(a2, pv, l...)`

respectively, where `pv` points to storage suitable to hold an object of type `U` and `a2` of type `A2` is a rebound copy of the allocator `a` passed to `allocate_shared` such that its `value_type` is `remove_cv_t<U>`.

(7.6) — When a (sub)object of non-array type `U` is specified to have a default initial value, `make_shared` shall initialize this (sub)object via the expression `::new(pv) U()`, where `pv` has type `void*` and points to storage suitable to hold an object of type `U`.

(7.7) — When a (sub)object of non-array type `U` is specified to have a default initial value, `allocate_shared` shall initialize this (sub)object via the expression `allocator_traits<A2>::construct(a2, pv)`, where `pv` points to storage suitable to hold an object of type `U` and `a2` of type `A2` is a rebound copy of the allocator `a` passed to `allocate_shared` such that its `value_type` is `remove_cv_t<U>`.

(7.8) — When a (sub)object of non-array type `U` is initialized by `make_shared_for_overwrite` or `allocate_shared_for_overwrite`, it is initialized via the expression `::new(pv) U`, where `pv` has type `void*` and points to storage suitable to hold an object of type `U`.

(7.9) — Array elements are initialized in ascending order of their addresses.

(7.10) — When the lifetime of the object managed by the return value ends, or when the initialization of an array element throws an exception, the initialized elements are destroyed in the reverse order of their original construction.

(7.11) — When a (sub)object of non-array type `U` that was initialized by `make_shared` is to be destroyed, it is destroyed via the expression `pv->~U()` where `pv` points to that object of type `U`.

(7.12) — When a (sub)object of non-array type `U` that was initialized by `allocate_shared` is to be destroyed, it is destroyed via the expression `allocator_traits<A2>::destroy(a2, pv)` where `pv` points to that object of type `remove_cv_t<U>` and `a2` of type `A2` is a rebound copy of the allocator `a` passed to `allocate_shared` such that its `value_type` is `remove_cv_t<U>`.

[*Note 2*: These functions will typically allocate more memory than `sizeof(T)` to allow for internal bookkeeping structures such as reference counts. — *end note*]

```
template<class T, class... Args>
  shared_ptr<T> make_shared(Args&&... args);                    // T is not array
template<class T, class A, class... Args>
  shared_ptr<T> allocate_shared(const A& a, Args&&... args);    // T is not array
```

8 *Constraints*: `T` is not an array type.

9 *Returns*: A `shared_ptr` to an object of type `T` with an initial value `T(forward<Args>(args)...)`.

10 *Remarks*: The `shared_ptr` constructors called by these functions enable `shared_from_this` with the address of the newly constructed object of type `T`.

11 [*Example 1*:

```
shared_ptr<int> p = make_shared<int>(); // shared_ptr to int()
shared_ptr<vector<int>> q = make_shared<vector<int>>(16, 1);
  // shared_ptr to vector of 16 elements with value 1
```

— *end example*]

```
template<class T> shared_ptr<T>
  make_shared(size_t N);                                        // T is U[]
template<class T, class A>
  shared_ptr<T> allocate_shared(const A& a, size_t N);          // T is U[]
```

12 *Constraints*: `T` is of the form `U[]`.

13 *Returns*: A `shared_ptr` to an object of type `U[N]` with a default initial value, where `U` is `remove_extent_t<T>`.

14 [*Example 2*:

```
shared_ptr<double[]> p = make_shared<double[]>(1024);
  // shared_ptr to a value-initialized double[1024]
shared_ptr<double[][2][2]> q = make_shared<double[][2][2]>(6);
  // shared_ptr to a value-initialized double[6][2][2]
```

— *end example*]

```
template<class T>
  shared_ptr<T> make_shared();                                  // T is U[N]
template<class T, class A>
  shared_ptr<T> allocate_shared(const A& a);                    // T is U[N]
```

15 *Constraints*: `T` is of the form `U[N]`.

16 *Returns*: A `shared_ptr` to an object of type `T` with a default initial value.

17 [*Example 3*:

```
shared_ptr<double[1024]> p = make_shared<double[1024]>();
  // shared_ptr to a value-initialized double[1024]
shared_ptr<double[6][2][2]> q = make_shared<double[6][2][2]>();
  // shared_ptr to a value-initialized double[6][2][2]
```

— *end example*]

```
template<class T>
  shared_ptr<T> make_shared(size_t N,
                            const remove_extent_t<T>& u);       // T is U[]
```

```
template<class T, class A>
  shared_ptr<T> allocate_shared(const A& a, size_t N,
                                const remove_extent_t<T>& u);   // T is U[]
```

18 *Constraints*: `T` is of the form `U[]`.

19 *Returns*: A `shared_ptr` to an object of type `U[N]`, where `U` is `remove_extent_t<T>` and each array element has an initial value of `u`.

20 [*Example 4*:

```
shared_ptr<double[]> p = make_shared<double[]>(1024, 1.0);
  // shared_ptr to a double[1024], where each element is 1.0
shared_ptr<double[][2]> q = make_shared<double[][2]>(6, {1.0, 0.0});
  // shared_ptr to a double[6][2], where each double[2] element is {1.0, 0.0}
shared_ptr<vector<int>[]> r = make_shared<vector<int>[]>(4, {1, 2});
  // shared_ptr to a vector<int>[4], where each vector has contents {1, 2}
```

— *end example*]

```
template<class T>
  shared_ptr<T> make_shared(const remove_extent_t<T>& u);       // T is U[N]
template<class T, class A>
  shared_ptr<T> allocate_shared(const A& a,
                                const remove_extent_t<T>& u);   // T is U[N]
```

21 *Constraints*: `T` is of the form `U[N]`.

22 *Returns*: A `shared_ptr` to an object of type `T`, where each array element of type `remove_extent_t<T>` has an initial value of `u`.

23 [*Example 5*:

```
shared_ptr<double[1024]> p = make_shared<double[1024]>(1.0);
  // shared_ptr to a double[1024], where each element is 1.0
shared_ptr<double[6][2]> q = make_shared<double[6][2]>({1.0, 0.0});
  // shared_ptr to a double[6][2], where each double[2] element is {1.0, 0.0}
shared_ptr<vector<int>[4]> r = make_shared<vector<int>[4]>({1, 2});
  // shared_ptr to a vector<int>[4], where each vector has contents {1, 2}
```

— *end example*]

```
template<class T>
  shared_ptr<T> make_shared_for_overwrite();
template<class T, class A>
  shared_ptr<T> allocate_shared_for_overwrite(const A& a);
```

24 *Constraints*: `T` is not an array of unknown bound.

25 *Returns*: A `shared_ptr` to an object of type `T`.

26 [*Example 6*:

```
struct X { double data[1024]; };
shared_ptr<X> p = make_shared_for_overwrite<X>();
  // shared_ptr to a default-initialized X, where each element in X::data has an indeterminate value

shared_ptr<double[1024]> q = make_shared_for_overwrite<double[1024]>();
  // shared_ptr to a default-initialized double[1024], where each element has an indeterminate value
```

— *end example*]

```
template<class T>
  shared_ptr<T> make_shared_for_overwrite(size_t N);
template<class T, class A>
  shared_ptr<T> allocate_shared_for_overwrite(const A& a, size_t N);
```

27 *Constraints*: `T` is an array of unknown bound.

28 *Returns*: A `shared_ptr` to an object of type `U[N]`, where `U` is `remove_extent_t<T>`.

29 [*Example 7*:

```
shared_ptr<double[]> p = make_shared_for_overwrite<double[]>(1024);
  // shared_ptr to a default-initialized double[1024], where each element has an indeterminate value
```

— *end example*]

20.11.3.8 Comparison [util.smartptr.shared.cmp]

```
template<class T, class U>
  bool operator==(const shared_ptr<T>& a, const shared_ptr<U>& b) noexcept;
```

1 *Returns*: `a.get() == b.get()`.

```
template<class T>
  bool operator==(const shared_ptr<T>& a, nullptr_t) noexcept;
```

2 *Returns*: `!a`.

```
template<class T, class U>
  strong_ordering operator<=>(const shared_ptr<T>& a, const shared_ptr<U>& b) noexcept;
```

3 *Returns*: `compare_three_way()(a.get(), b.get())`.

4 [*Note 1*: Defining a comparison operator function allows `shared_ptr` objects to be used as keys in associative containers. — *end note*]

```
template<class T>
  strong_ordering operator<=>(const shared_ptr<T>& a, nullptr_t) noexcept;
```

5 *Returns*: `compare_three_way()(a.get(), nullptr)`.

20.11.3.9 Specialized algorithms [util.smartptr.shared.spec]

```
template<class T>
  void swap(shared_ptr<T>& a, shared_ptr<T>& b) noexcept;
```

1 *Effects*: Equivalent to `a.swap(b)`.

20.11.3.10 Casts [util.smartptr.shared.cast]

```
template<class T, class U>
  shared_ptr<T> static_pointer_cast(const shared_ptr<U>& r) noexcept;
template<class T, class U>
  shared_ptr<T> static_pointer_cast(shared_ptr<U>&& r) noexcept;
```

1 *Mandates*: The expression `static_cast<T*>((U*)nullptr)` is well-formed.

2 *Returns*:

```
shared_ptr<T>(R, static_cast<typename shared_ptr<T>::element_type*>(r.get()))
```

where *R* is `r` for the first overload, and `std::move(r)` for the second.

3 [*Note 1*: The seemingly equivalent expression `shared_ptr<T>(static_cast<T*>(r.get()))` will eventually result in undefined behavior, attempting to delete the same object twice. — *end note*]

```
template<class T, class U>
  shared_ptr<T> dynamic_pointer_cast(const shared_ptr<U>& r) noexcept;
template<class T, class U>
  shared_ptr<T> dynamic_pointer_cast(shared_ptr<U>&& r) noexcept;
```

4 *Mandates*: The expression `dynamic_cast<T*>((U*)nullptr)` is well-formed. The expression `dynamic_cast<typename shared_ptr<T>::element_type*>(r.get())` is well-formed.

5 *Preconditions*: The expression `dynamic_cast<typename shared_ptr<T>::element_type*>(r.get())` has well-defined behavior.

6 *Returns*:

(6.1) — When `dynamic_cast<typename shared_ptr<T>::element_type*>(r.get())` returns a non-null value `p`, `shared_ptr<T>(R, p)`, where *R* is `r` for the first overload, and `std::move(r)` for the second.

(6.2) — Otherwise, `shared_ptr<T>()`.

7 [*Note 2*: The seemingly equivalent expression `shared_ptr<T>(dynamic_cast<T*>(r.get()))` will eventually result in undefined behavior, attempting to delete the same object twice. — *end note*]

```
template<class T, class U>
  shared_ptr<T> const_pointer_cast(const shared_ptr<U>& r) noexcept;
template<class T, class U>
  shared_ptr<T> const_pointer_cast(shared_ptr<U>&& r) noexcept;
```

8 *Mandates*: The expression `const_cast<T*>((U*)nullptr)` is well-formed.

9 *Returns*:

```
shared_ptr<T>(R, const_cast<typename shared_ptr<T>::element_type*>(r.get()))
```

where *R* is `r` for the first overload, and `std::move(r)` for the second.

10 [*Note 3*: The seemingly equivalent expression `shared_ptr<T>(const_cast<T*>(r.get()))` will eventually result in undefined behavior, attempting to delete the same object twice. — *end note*]

```
template<class T, class U>
  shared_ptr<T> reinterpret_pointer_cast(const shared_ptr<U>& r) noexcept;
template<class T, class U>
  shared_ptr<T> reinterpret_pointer_cast(shared_ptr<U>&& r) noexcept;
```

11 *Mandates*: The expression `reinterpret_cast<T*>((U*)nullptr)` is well-formed.

12 *Returns*:

```
shared_ptr<T>(R, reinterpret_cast<typename shared_ptr<T>::element_type*>(r.get()))
```

where *R* is `r` for the first overload, and `std::move(r)` for the second.

13 [*Note 4*: The seemingly equivalent expression `shared_ptr<T>(reinterpret_cast<T*>(r.get()))` will eventually result in undefined behavior, attempting to delete the same object twice. — *end note*]

20.11.3.11 `get_deleter` [util.smartptr.getdeleter]

```
template<class D, class T>
  D* get_deleter(const shared_ptr<T>& p) noexcept;
```

1 *Returns*: If `p` owns a deleter `d` of type cv-unqualified `D`, returns `addressof(d)`; otherwise returns `nullptr`. The returned pointer remains valid as long as there exists a `shared_ptr` instance that owns `d`.

[*Note 1*: It is unspecified whether the pointer remains valid longer than that. This can happen if the implementation doesn't destroy the deleter until all `weak_ptr` instances that share ownership with `p` have been destroyed. — *end note*]

20.11.3.12 I/O [util.smartptr.shared.io]

```
template<class E, class T, class Y>
  basic_ostream<E, T>& operator<<(basic_ostream<E, T>& os, const shared_ptr<Y>& p);
```

1 *Effects*: As if by: `os << p.get();`

2 *Returns*: `os`.

20.11.4 Class template `weak_ptr` [util.smartptr.weak]

20.11.4.1 General [util.smartptr.weak.general]

1 The `weak_ptr` class template stores a weak reference to an object that is already managed by a `shared_ptr`. To access the object, a `weak_ptr` can be converted to a `shared_ptr` using the member function `lock`.

```
namespace std {
  template<class T> class weak_ptr {
  public:
    using element_type = remove_extent_t<T>;

    // 20.11.4.2, constructors
    constexpr weak_ptr() noexcept;
    template<class Y>
      weak_ptr(const shared_ptr<Y>& r) noexcept;
    weak_ptr(const weak_ptr& r) noexcept;
    template<class Y>
      weak_ptr(const weak_ptr<Y>& r) noexcept;
    weak_ptr(weak_ptr&& r) noexcept;
```

```
    template<class Y>
      weak_ptr(weak_ptr<Y>&& r) noexcept;

    // 20.11.4.3, destructor
    ~weak_ptr();

    // 20.11.4.4, assignment
    weak_ptr& operator=(const weak_ptr& r) noexcept;
    template<class Y>
      weak_ptr& operator=(const weak_ptr<Y>& r) noexcept;
    template<class Y>
      weak_ptr& operator=(const shared_ptr<Y>& r) noexcept;
    weak_ptr& operator=(weak_ptr&& r) noexcept;
    template<class Y>
      weak_ptr& operator=(weak_ptr<Y>&& r) noexcept;

    // 20.11.4.5, modifiers
    void swap(weak_ptr& r) noexcept;
    void reset() noexcept;

    // 20.11.4.6, observers
    long use_count() const noexcept;
    bool expired() const noexcept;
    shared_ptr<T> lock() const noexcept;
    template<class U>
      bool owner_before(const shared_ptr<U>& b) const noexcept;
    template<class U>
      bool owner_before(const weak_ptr<U>& b) const noexcept;
  };

  template<class T>
    weak_ptr(shared_ptr<T>) -> weak_ptr<T>;

  // 20.11.4.7, specialized algorithms
  template<class T>
    void swap(weak_ptr<T>& a, weak_ptr<T>& b) noexcept;
}
```

2 Specializations of `weak_ptr` shall be *Cpp17CopyConstructible* and *Cpp17CopyAssignable*, allowing their use in standard containers. The template parameter `T` of `weak_ptr` may be an incomplete type.

20.11.4.2 Constructors [util.smartptr.weak.const]

```
constexpr weak_ptr() noexcept;
```

1 *Effects*: Constructs an empty `weak_ptr` object.

2 *Postconditions*: `use_count() == 0`.

```
weak_ptr(const weak_ptr& r) noexcept;
template<class Y> weak_ptr(const weak_ptr<Y>& r) noexcept;
template<class Y> weak_ptr(const shared_ptr<Y>& r) noexcept;
```

3 *Constraints*: For the second and third constructors, `Y*` is compatible with `T*`.

4 *Effects*: If `r` is empty, constructs an empty `weak_ptr` object; otherwise, constructs a `weak_ptr` object that shares ownership with `r` and stores a copy of the pointer stored in `r`.

5 *Postconditions*: `use_count() == r.use_count()`.

```
weak_ptr(weak_ptr&& r) noexcept;
template<class Y> weak_ptr(weak_ptr<Y>&& r) noexcept;
```

6 *Constraints*: For the second constructor, `Y*` is compatible with `T*`.

7 *Effects*: Move constructs a `weak_ptr` instance from `r`.

8 *Postconditions*: `*this` shall contain the old value of `r`. `r` shall be empty. `r.use_count() == 0`.

20.11.4.3 Destructor [util.smartptr.weak.dest]

```
~weak_ptr();
```

1 *Effects*: Destroys this `weak_ptr` object but has no effect on the object its stored pointer points to.

20.11.4.4 Assignment [util.smartptr.weak.assign]

```
weak_ptr& operator=(const weak_ptr& r) noexcept;
template<class Y> weak_ptr& operator=(const weak_ptr<Y>& r) noexcept;
template<class Y> weak_ptr& operator=(const shared_ptr<Y>& r) noexcept;
```

1 *Effects*: Equivalent to `weak_ptr(r).swap(*this)`.

2 *Returns*: `*this`.

3 *Remarks*: The implementation may meet the effects (and the implied guarantees) via different means, without creating a temporary object.

```
weak_ptr& operator=(weak_ptr&& r) noexcept;
template<class Y> weak_ptr& operator=(weak_ptr<Y>&& r) noexcept;
```

4 *Effects*: Equivalent to `weak_ptr(std::move(r)).swap(*this)`.

5 *Returns*: `*this`.

20.11.4.5 Modifiers [util.smartptr.weak.mod]

```
void swap(weak_ptr& r) noexcept;
```

1 *Effects*: Exchanges the contents of `*this` and `r`.

```
void reset() noexcept;
```

2 *Effects*: Equivalent to `weak_ptr().swap(*this)`.

20.11.4.6 Observers [util.smartptr.weak.obs]

```
long use_count() const noexcept;
```

1 *Returns*: `0` if `*this` is empty; otherwise, the number of `shared_ptr` instances that share ownership with `*this`.

```
bool expired() const noexcept;
```

2 *Returns*: `use_count() == 0`.

```
shared_ptr<T> lock() const noexcept;
```

3 *Returns*: `expired() ? shared_ptr<T>() : shared_ptr<T>(*this)`, executed atomically.

```
template<class U> bool owner_before(const shared_ptr<U>& b) const noexcept;
template<class U> bool owner_before(const weak_ptr<U>& b) const noexcept;
```

4 *Returns*: An unspecified value such that

(4.1) — `x.owner_before(y)` defines a strict weak ordering as defined in 25.8;

(4.2) — under the equivalence relation defined by `owner_before`, `!a.owner_before(b) && !b.owner_before(a)`, two `shared_ptr` or `weak_ptr` instances are equivalent if and only if they share ownership or are both empty.

20.11.4.7 Specialized algorithms [util.smartptr.weak.spec]

```
template<class T>
  void swap(weak_ptr<T>& a, weak_ptr<T>& b) noexcept;
```

1 *Effects*: Equivalent to `a.swap(b)`.

20.11.5 Class template `owner_less` [util.smartptr.ownerless]

1 The class template `owner_less` allows ownership-based mixed comparisons of shared and weak pointers.

```
namespace std {
  template<class T = void> struct owner_less;
```

```
  template<class T> struct owner_less<shared_ptr<T>> {
    bool operator()(const shared_ptr<T>&, const shared_ptr<T>&) const noexcept;
    bool operator()(const shared_ptr<T>&, const weak_ptr<T>&) const noexcept;
    bool operator()(const weak_ptr<T>&, const shared_ptr<T>&) const noexcept;
  };

  template<class T> struct owner_less<weak_ptr<T>> {
    bool operator()(const weak_ptr<T>&, const weak_ptr<T>&) const noexcept;
    bool operator()(const shared_ptr<T>&, const weak_ptr<T>&) const noexcept;
    bool operator()(const weak_ptr<T>&, const shared_ptr<T>&) const noexcept;
  };

  template<> struct owner_less<void> {
    template<class T, class U>
      bool operator()(const shared_ptr<T>&, const shared_ptr<U>&) const noexcept;
    template<class T, class U>
      bool operator()(const shared_ptr<T>&, const weak_ptr<U>&) const noexcept;
    template<class T, class U>
      bool operator()(const weak_ptr<T>&, const shared_ptr<U>&) const noexcept;
    template<class T, class U>
      bool operator()(const weak_ptr<T>&, const weak_ptr<U>&) const noexcept;

    using is_transparent = unspecified;
  };
}
```

2 `operator()(x, y)` returns `x.owner_before(y)`.

[*Note 1*: Note that

(2.1) — `operator()` defines a strict weak ordering as defined in 25.8;

(2.2) — two `shared_ptr` or `weak_ptr` instances are equivalent under the equivalence relation defined by `operator()`, `!operator()(a, b) && !operator()(b, a)`, if and only if they share ownership or are both empty.

— *end note*]

20.11.6 Class template `enable_shared_from_this` [util.smartptr.enab]

1 A class `T` can inherit from `enable_shared_from_this<T>` to inherit the `shared_from_this` member functions that obtain a `shared_ptr` instance pointing to `*this`.

2 [*Example 1*:

```
struct X: public enable_shared_from_this<X> { };

int main() {
  shared_ptr<X> p(new X);
  shared_ptr<X> q = p->shared_from_this();
  assert(p == q);
  assert(!p.owner_before(q) && !q.owner_before(p)); // p and q share ownership
}
```

— *end example*]

```
namespace std {
  template<class T> class enable_shared_from_this {
  protected:
    constexpr enable_shared_from_this() noexcept;
    enable_shared_from_this(const enable_shared_from_this&) noexcept;
    enable_shared_from_this& operator=(const enable_shared_from_this&) noexcept;
    ~enable_shared_from_this();

  public:
    shared_ptr<T> shared_from_this();
    shared_ptr<T const> shared_from_this() const;
    weak_ptr<T> weak_from_this() noexcept;
    weak_ptr<T const> weak_from_this() const noexcept;
```

```
    private:
      mutable weak_ptr<T> weak_this;   // exposition only
    };
  }
```

3 The template parameter `T` of `enable_shared_from_this` may be an incomplete type.

```
constexpr enable_shared_from_this() noexcept;
enable_shared_from_this(const enable_shared_from_this<T>&) noexcept;
```

4 *Effects*: Value-initializes `weak_this`.

```
enable_shared_from_this<T>& operator=(const enable_shared_from_this<T>&) noexcept;
```

5 *Returns*: `*this`.

6 [*Note 1*: `weak_this` is not changed. — *end note*]

```
shared_ptr<T>       shared_from_this();
shared_ptr<T const> shared_from_this() const;
```

7 *Returns*: `shared_ptr<T>(weak_this)`.

```
weak_ptr<T>       weak_from_this() noexcept;
weak_ptr<T const> weak_from_this() const noexcept;
```

8 *Returns*: `weak_this`.

20.11.7 Smart pointer hash support [util.smartptr.hash]

```
template<class T, class D> struct hash<unique_ptr<T, D>>;
```

1 Letting `UP` be `unique_ptr<T,D>`, the specialization `hash<UP>` is enabled (20.14.19) if and only if `hash<typename UP::pointer>` is enabled. When enabled, for an object `p` of type `UP`, `hash<UP>()(p)` evaluates to the same value as `hash<typename UP::pointer>()(p.get())`. The member functions are not guaranteed to be `noexcept`.

```
template<class T> struct hash<shared_ptr<T>>;
```

2 For an object `p` of type `shared_ptr<T>`, `hash<shared_ptr<T>>()(p)` evaluates to the same value as `hash<typename shared_ptr<T>::element_type*>()(p.get())`.

20.12 Memory resources [mem.res]

20.12.1 Header <memory_resource> synopsis [mem.res.syn]

```
  namespace std::pmr {
    // 20.12.2, class memory_resource
    class memory_resource;

    bool operator==(const memory_resource& a, const memory_resource& b) noexcept;

    // 20.12.3, class template polymorphic_allocator
    template<class Tp = byte> class polymorphic_allocator;

    template<class T1, class T2>
      bool operator==(const polymorphic_allocator<T1>& a,
                      const polymorphic_allocator<T2>& b) noexcept;

    // 20.12.4, global memory resources
    memory_resource* new_delete_resource() noexcept;
    memory_resource* null_memory_resource() noexcept;
    memory_resource* set_default_resource(memory_resource* r) noexcept;
    memory_resource* get_default_resource() noexcept;

    // 20.12.5, pool resource classes
    struct pool_options;
    class synchronized_pool_resource;
    class unsynchronized_pool_resource;
```

```
    class monotonic_buffer_resource;
  }
```

20.12.2 Class memory_resource [mem.res.class]

20.12.2.1 General [mem.res.class.general]

1 The `memory_resource` class is an abstract interface to an unbounded set of classes encapsulating memory resources.

```
namespace std::pmr {
  class memory_resource {
    static constexpr size_t max_align = alignof(max_align_t);   // exposition only

  public:
    memory_resource() = default;
    memory_resource(const memory_resource&) = default;
    virtual ~memory_resource();

    memory_resource& operator=(const memory_resource&) = default;

    [[nodiscard]] void* allocate(size_t bytes, size_t alignment = max_align);
    void deallocate(void* p, size_t bytes, size_t alignment = max_align);

    bool is_equal(const memory_resource& other) const noexcept;

  private:
    virtual void* do_allocate(size_t bytes, size_t alignment) = 0;
    virtual void do_deallocate(void* p, size_t bytes, size_t alignment) = 0;

    virtual bool do_is_equal(const memory_resource& other) const noexcept = 0;
  };
}
```

20.12.2.2 Public member functions [mem.res.public]

```
~memory_resource();
```

1 *Effects*: Destroys this `memory_resource`.

```
[[nodiscard]] void* allocate(size_t bytes, size_t alignment = max_align);
```

2 *Effects*: Equivalent to: `return do_allocate(bytes, alignment);`

```
void deallocate(void* p, size_t bytes, size_t alignment = max_align);
```

3 *Effects*: Equivalent to `do_deallocate(p, bytes, alignment)`.

```
bool is_equal(const memory_resource& other) const noexcept;
```

4 *Effects*: Equivalent to: `return do_is_equal(other);`

20.12.2.3 Private virtual member functions [mem.res.private]

```
virtual void* do_allocate(size_t bytes, size_t alignment) = 0;
```

1 *Preconditions*: `alignment` is a power of two.

2 *Returns*: A derived class shall implement this function to return a pointer to allocated storage (6.7.5.5.2) with a size of at least `bytes`, aligned to the specified `alignment`.

3 *Throws*: A derived class implementation shall throw an appropriate exception if it is unable to allocate memory with the requested size and alignment.

```
virtual void do_deallocate(void* p, size_t bytes, size_t alignment) = 0;
```

4 *Preconditions*: `p` was returned from a prior call to `allocate(bytes, alignment)` on a memory resource equal to `*this`, and the storage at `p` has not yet been deallocated.

5 *Effects*: A derived class shall implement this function to dispose of allocated storage.

6 *Throws*: Nothing.

```
virtual bool do_is_equal(const memory_resource& other) const noexcept = 0;
```

7 *Returns*: A derived class shall implement this function to return `true` if memory allocated from `this` can be deallocated from `other` and vice-versa, otherwise `false`.

[*Note 1*: The most-derived type of `other` might not match the type of `this`. For a derived class `D`, an implementation of this function could immediately return `false` if `dynamic_cast<const D*>(&other) == nullptr`. — *end note*]

20.12.2.4 Equality [mem.res.eq]

```
bool operator==(const memory_resource& a, const memory_resource& b) noexcept;
```

1 *Returns*: `&a == &b || a.is_equal(b)`.

20.12.3 Class template polymorphic_allocator [mem.poly.allocator.class]

20.12.3.1 General [mem.poly.allocator.class.general]

1 A specialization of class template `pmr::polymorphic_allocator` meets the *Cpp17Allocator* requirements (Table 36). Constructed with different memory resources, different instances of the same specialization of `pmr::polymorphic_allocator` can exhibit entirely different allocation behavior. This runtime polymorphism allows objects that use `polymorphic_allocator` to behave as if they used different allocator types at run time even though they use the same static allocator type.

2 All specializations of class template `pmr::polymorphic_allocator` meet the allocator completeness requirements (16.4.4.6.2).

```
namespace std::pmr {
  template<class Tp = byte> class polymorphic_allocator {
    memory_resource* memory_rsrc;         // exposition only

  public:
    using value_type = Tp;

    // 20.12.3.2, constructors
    polymorphic_allocator() noexcept;
    polymorphic_allocator(memory_resource* r);

    polymorphic_allocator(const polymorphic_allocator& other) = default;

    template<class U>
      polymorphic_allocator(const polymorphic_allocator<U>& other) noexcept;

    polymorphic_allocator& operator=(const polymorphic_allocator&) = delete;

    // 20.12.3.3, member functions
    [[nodiscard]] Tp* allocate(size_t n);
    void deallocate(Tp* p, size_t n);

    [[nodiscard]] void* allocate_bytes(size_t nbytes, size_t alignment = alignof(max_align_t));
    void deallocate_bytes(void* p, size_t nbytes, size_t alignment = alignof(max_align_t));
    template<class T> [[nodiscard]] T* allocate_object(size_t n = 1);
    template<class T> void deallocate_object(T* p, size_t n = 1);
    template<class T, class... CtorArgs> [[nodiscard]] T* new_object(CtorArgs&&... ctor_args);
    template<class T> void delete_object(T* p);

    template<class T, class... Args>
      void construct(T* p, Args&&... args);

    template<class T>
      void destroy(T* p);

    polymorphic_allocator select_on_container_copy_construction() const;

    memory_resource* resource() const;
  };
}
```

20.12.3.2 Constructors [mem.poly.allocator.ctor]

```
polymorphic_allocator() noexcept;
```

1 *Effects*: Sets memory_rsrc to get_default_resource().

```
polymorphic_allocator(memory_resource* r);
```

2 *Preconditions*: r is non-null.

3 *Effects*: Sets memory_rsrc to r.

4 *Throws*: Nothing.

5 [*Note 1*: This constructor provides an implicit conversion from memory_resource*. — *end note*]

```
template<class U> polymorphic_allocator(const polymorphic_allocator<U>& other) noexcept;
```

6 *Effects*: Sets memory_rsrc to other.resource().

20.12.3.3 Member functions [mem.poly.allocator.mem]

```
[[nodiscard]] Tp* allocate(size_t n);
```

1 *Effects*: If numeric_limits<size_t>::max() / sizeof(Tp) < n, throws bad_array_new_length. Otherwise equivalent to:

```
return static_cast<Tp*>(memory_rsrc->allocate(n * sizeof(Tp), alignof(Tp)));
```

```
void deallocate(Tp* p, size_t n);
```

2 *Preconditions*: p was allocated from a memory resource x, equal to *memory_rsrc, using x.allocate(n * sizeof(Tp), alignof(Tp)).

3 *Effects*: Equivalent to memory_rsrc->deallocate(p, n * sizeof(Tp), alignof(Tp)).

4 *Throws*: Nothing.

```
[[nodiscard]] void* allocate_bytes(size_t nbytes, size_t alignment = alignof(max_align_t));
```

5 *Effects*: Equivalent to: return memory_rsrc->allocate(nbytes, alignment);

6 [*Note 1*: The return type is void* (rather than, e.g., byte*) to support conversion to an arbitrary pointer type U* by static_cast<U*>, thus facilitating construction of a U object in the allocated memory. — *end note*]

```
void deallocate_bytes(void* p, size_t nbytes, size_t alignment = alignof(max_align_t));
```

7 *Effects*: Equivalent to memory_rsrc->deallocate(p, nbytes, alignment).

```
template<class T>
  [[nodiscard]] T* allocate_object(size_t n = 1);
```

8 *Effects*: Allocates memory suitable for holding an array of n objects of type T, as follows:

(8.1) — if numeric_limits<size_t>::max() / sizeof(T) < n, throws bad_array_new_length,

(8.2) — otherwise equivalent to:

```
return static_cast<T*>(allocate_bytes(n*sizeof(T), alignof(T)));
```

9 [*Note 2*: T is not deduced and must therefore be provided as a template argument. — *end note*]

```
template<class T>
  void deallocate_object(T* p, size_t n = 1);
```

10 *Effects*: Equivalent to deallocate_bytes(p, n*sizeof(T), alignof(T)).

```
template<class T, class... CtorArgs>
  [[nodiscard]] T* new_object(CtorArgs&&... ctor_args);
```

11 *Effects*: Allocates and constructs an object of type T, as follows.
Equivalent to:

```
T* p = allocate_object<T>();
try {
  construct(p, std::forward<CtorArgs>(ctor_args)...);
} catch (...) {
  deallocate_object(p);
```

```
    throw;
  }
  return p;
```

12 [*Note 3*: `T` is not deduced and must therefore be provided as a template argument. — *end note*]

```
template<class T>
  void delete_object(T* p);
```

13 *Effects*: Equivalent to:

```
destroy(p);
deallocate_object(p);
```

```
template<class T, class... Args>
  void construct(T* p, Args&&... args);
```

14 *Mandates*: Uses-allocator construction of `T` with allocator `*this` (see 20.10.8.2) and constructor arguments `std::forward<Args>(args)...` is well-formed.

15 *Effects*: Construct a `T` object in the storage whose address is represented by `p` by uses-allocator construction with allocator `*this` and constructor arguments `std::forward<Args>(args)...`.

16 *Throws*: Nothing unless the constructor for `T` throws.

```
template<class T>
  void destroy(T* p);
```

17 *Effects*: As if by `p->~T()`.

```
polymorphic_allocator select_on_container_copy_construction() const;
```

18 *Returns*: `polymorphic_allocator()`.

19 [*Note 4*: The memory resource is not propagated. — *end note*]

```
memory_resource* resource() const;
```

20 *Returns*: `memory_rsrc`.

20.12.3.4 Equality [mem.poly.allocator.eq]

```
template<class T1, class T2>
  bool operator==(const polymorphic_allocator<T1>& a,
                  const polymorphic_allocator<T2>& b) noexcept;
```

1 *Returns*: `*a.resource() == *b.resource()`.

20.12.4 Access to program-wide `memory_resource` objects [mem.res.global]

```
memory_resource* new_delete_resource() noexcept;
```

1 *Returns*: A pointer to a static-duration object of a type derived from `memory_resource` that can serve as a resource for allocating memory using `::operator new` and `::operator delete`. The same value is returned every time this function is called. For a return value `p` and a memory resource `r`, `p->is_equal(r)` returns `&r == p`.

```
memory_resource* null_memory_resource() noexcept;
```

2 *Returns*: A pointer to a static-duration object of a type derived from `memory_resource` for which `allocate()` always throws `bad_alloc` and for which `deallocate()` has no effect. The same value is returned every time this function is called. For a return value `p` and a memory resource `r`, `p->is_equal(r)` returns `&r == p`.

3 The *default memory resource pointer* is a pointer to a memory resource that is used by certain facilities when an explicit memory resource is not supplied through the interface. Its initial value is the return value of `new_delete_resource()`.

```
memory_resource* set_default_resource(memory_resource* r) noexcept;
```

4 *Effects*: If `r` is non-null, sets the value of the default memory resource pointer to `r`, otherwise sets the default memory resource pointer to `new_delete_resource()`.

5 *Returns*: The previous value of the default memory resource pointer.

6 *Remarks*: Calling the `set_default_resource` and `get_default_resource` functions shall not incur a data race. A call to the `set_default_resource` function shall synchronize with subsequent calls to the `set_default_resource` and `get_default_resource` functions.

```
memory_resource* get_default_resource() noexcept;
```

7 *Returns*: The current value of the default memory resource pointer.

20.12.5 Pool resource classes [mem.res.pool]

20.12.5.1 Classes `synchronized_pool_resource` and `unsynchronized_pool_resource` [mem.res.pool.overview]

1 The `synchronized_pool_resource` and `unsynchronized_pool_resource` classes (collectively called *pool resource classes*) are general-purpose memory resources having the following qualities:

(1.1) — Each resource frees its allocated memory on destruction, even if `deallocate` has not been called for some of the allocated blocks.

(1.2) — A pool resource consists of a collection of *pools*, serving requests for different block sizes. Each individual pool manages a collection of *chunks* that are in turn divided into blocks of uniform size, returned via calls to `do_allocate`. Each call to `do_allocate(size, alignment)` is dispatched to the pool serving the smallest blocks accommodating at least `size` bytes.

(1.3) — When a particular pool is exhausted, allocating a block from that pool results in the allocation of an additional chunk of memory from the *upstream allocator* (supplied at construction), thus replenishing the pool. With each successive replenishment, the chunk size obtained increases geometrically.

[*Note 1*: By allocating memory in chunks, the pooling strategy increases the chance that consecutive allocations will be close together in memory. —*end note*]

(1.4) — Allocation requests that exceed the largest block size of any pool are fulfilled directly from the upstream allocator.

(1.5) — A `pool_options` struct may be passed to the pool resource constructors to tune the largest block size and the maximum chunk size.

2 A `synchronized_pool_resource` may be accessed from multiple threads without external synchronization and may have thread-specific pools to reduce synchronization costs. An `unsynchronized_pool_resource` class may not be accessed from multiple threads simultaneously and thus avoids the cost of synchronization entirely in single-threaded applications.

```
namespace std::pmr {
  struct pool_options {
    size_t max_blocks_per_chunk = 0;
    size_t largest_required_pool_block = 0;
  };

  class synchronized_pool_resource : public memory_resource {
  public:
    synchronized_pool_resource(const pool_options& opts, memory_resource* upstream);

    synchronized_pool_resource()
        : synchronized_pool_resource(pool_options(), get_default_resource()) {}
    explicit synchronized_pool_resource(memory_resource* upstream)
        : synchronized_pool_resource(pool_options(), upstream) {}
    explicit synchronized_pool_resource(const pool_options& opts)
        : synchronized_pool_resource(opts, get_default_resource()) {}

    synchronized_pool_resource(const synchronized_pool_resource&) = delete;
    virtual ~synchronized_pool_resource();

    synchronized_pool_resource& operator=(const synchronized_pool_resource&) = delete;

    void release();
    memory_resource* upstream_resource() const;
    pool_options options() const;
```

```
  protected:
    void* do_allocate(size_t bytes, size_t alignment) override;
    void do_deallocate(void* p, size_t bytes, size_t alignment) override;

    bool do_is_equal(const memory_resource& other) const noexcept override;
  };

  class unsynchronized_pool_resource : public memory_resource {
  public:
    unsynchronized_pool_resource(const pool_options& opts, memory_resource* upstream);

    unsynchronized_pool_resource()
        : unsynchronized_pool_resource(pool_options(), get_default_resource()) {}
    explicit unsynchronized_pool_resource(memory_resource* upstream)
        : unsynchronized_pool_resource(pool_options(), upstream) {}
    explicit unsynchronized_pool_resource(const pool_options& opts)
        : unsynchronized_pool_resource(opts, get_default_resource()) {}

    unsynchronized_pool_resource(const unsynchronized_pool_resource&) = delete;
    virtual ~unsynchronized_pool_resource();

    unsynchronized_pool_resource& operator=(const unsynchronized_pool_resource&) = delete;

    void release();
    memory_resource* upstream_resource() const;
    pool_options options() const;

  protected:
    void* do_allocate(size_t bytes, size_t alignment) override;
    void do_deallocate(void* p, size_t bytes, size_t alignment) override;

    bool do_is_equal(const memory_resource& other) const noexcept override;
  };
}
```

20.12.5.2 `pool_options` data members [mem.res.pool.options]

1 The members of `pool_options` comprise a set of constructor options for pool resources. The effect of each option on the pool resource behavior is described below:

`size_t max_blocks_per_chunk;`

2 The maximum number of blocks that will be allocated at once from the upstream memory resource (20.12.6) to replenish a pool. If the value of `max_blocks_per_chunk` is zero or is greater than an implementation-defined limit, that limit is used instead. The implementation may choose to use a smaller value than is specified in this field and may use different values for different pools.

`size_t largest_required_pool_block;`

3 The largest allocation size that is required to be fulfilled using the pooling mechanism. Attempts to allocate a single block larger than this threshold will be allocated directly from the upstream memory resource. If `largest_required_pool_block` is zero or is greater than an implementation-defined limit, that limit is used instead. The implementation may choose a pass-through threshold larger than specified in this field.

20.12.5.3 Constructors and destructors [mem.res.pool.ctor]

```
synchronized_pool_resource(const pool_options& opts, memory_resource* upstream);
unsynchronized_pool_resource(const pool_options& opts, memory_resource* upstream);
```

1 *Preconditions*: `upstream` is the address of a valid memory resource.

2 *Effects*: Constructs a pool resource object that will obtain memory from `upstream` whenever the pool resource is unable to satisfy a memory request from its own internal data structures. The resulting object will hold a copy of `upstream`, but will not own the resource to which `upstream` points.

[*Note 1*: The intention is that calls to `upstream->allocate()` will be substantially fewer than calls to `this->allocate()` in most cases. — *end note*]

The behavior of the pooling mechanism is tuned according to the value of the `opts` argument.

3 *Throws*: Nothing unless `upstream->allocate()` throws. It is unspecified if, or under what conditions, this constructor calls `upstream->allocate()`.

```
virtual ~synchronized_pool_resource();
virtual ~unsynchronized_pool_resource();
```

4 *Effects*: Calls `release()`.

20.12.5.4 Members [mem.res.pool.mem]

```
void release();
```

1 *Effects*: Calls `upstream_resource()->deallocate()` as necessary to release all allocated memory.

[*Note 1*: The memory is released back to `upstream_resource()` even if `deallocate` has not been called for some of the allocated blocks. — *end note*]

```
memory_resource* upstream_resource() const;
```

2 *Returns*: The value of the `upstream` argument provided to the constructor of this object.

```
pool_options options() const;
```

3 *Returns*: The options that control the pooling behavior of this resource. The values in the returned struct may differ from those supplied to the pool resource constructor in that values of zero will be replaced with implementation-defined defaults, and sizes may be rounded to unspecified granularity.

```
void* do_allocate(size_t bytes, size_t alignment) override;
```

4 *Effects*: If the pool selected for a block of size `bytes` is unable to satisfy the memory request from its own internal data structures, it will call `upstream_resource()->allocate()` to obtain more memory. If `bytes` is larger than that which the largest pool can handle, then memory will be allocated using `upstream_resource()->allocate()`.

5 *Returns*: A pointer to allocated storage (6.7.5.5.2) with a size of at least `bytes`. The size and alignment of the allocated memory shall meet the requirements for a class derived from `memory_resource` (20.12.2).

6 *Throws*: Nothing unless `upstream_resource()->allocate()` throws.

```
void do_deallocate(void* p, size_t bytes, size_t alignment) override;
```

7 *Effects*: Returns the memory at `p` to the pool. It is unspecified if, or under what circumstances, this operation will result in a call to `upstream_resource()->deallocate()`.

8 *Throws*: Nothing.

```
bool do_is_equal(const memory_resource& other) const noexcept override;
```

9 *Returns*: `this == &other`.

20.12.6 Class `monotonic_buffer_resource` [mem.res.monotonic.buffer]

20.12.6.1 General [mem.res.monotonic.buffer.general]

1 A `monotonic_buffer_resource` is a special-purpose memory resource intended for very fast memory allocations in situations where memory is used to build up a few objects and then is released all at once when the memory resource object is destroyed. It has the following qualities:

(1.1) — A call to `deallocate` has no effect, thus the amount of memory consumed increases monotonically until the resource is destroyed.

(1.2) — The program can supply an initial buffer, which the allocator uses to satisfy memory requests.

(1.3) — When the initial buffer (if any) is exhausted, it obtains additional buffers from an *upstream* memory resource supplied at construction. Each additional buffer is larger than the previous one, following a geometric progression.

(1.4) — It is intended for access from one thread of control at a time. Specifically, calls to `allocate` and `deallocate` do not synchronize with one another.

(1.5) — It frees the allocated memory on destruction, even if `deallocate` has not been called for some of the allocated blocks.

```
namespace std::pmr {
  class monotonic_buffer_resource : public memory_resource {
    memory_resource* upstream_rsrc;     // exposition only
    void* current_buffer;               // exposition only
    size_t next_buffer_size;            // exposition only

  public:
    explicit monotonic_buffer_resource(memory_resource* upstream);
    monotonic_buffer_resource(size_t initial_size, memory_resource* upstream);
    monotonic_buffer_resource(void* buffer, size_t buffer_size, memory_resource* upstream);

    monotonic_buffer_resource()
      : monotonic_buffer_resource(get_default_resource()) {}
    explicit monotonic_buffer_resource(size_t initial_size)
      : monotonic_buffer_resource(initial_size, get_default_resource()) {}
    monotonic_buffer_resource(void* buffer, size_t buffer_size)
      : monotonic_buffer_resource(buffer, buffer_size, get_default_resource()) {}

    monotonic_buffer_resource(const monotonic_buffer_resource&) = delete;

    virtual ~monotonic_buffer_resource();

    monotonic_buffer_resource& operator=(const monotonic_buffer_resource&) = delete;

    void release();
    memory_resource* upstream_resource() const;

  protected:
    void* do_allocate(size_t bytes, size_t alignment) override;
    void do_deallocate(void* p, size_t bytes, size_t alignment) override;

    bool do_is_equal(const memory_resource& other) const noexcept override;
  };
}
```

20.12.6.2 Constructors and destructor [mem.res.monotonic.buffer.ctor]

```
explicit monotonic_buffer_resource(memory_resource* upstream);
monotonic_buffer_resource(size_t initial_size, memory_resource* upstream);
```

1 *Preconditions*: `upstream` is the address of a valid memory resource. `initial_size`, if specified, is greater than zero.

2 *Effects*: Sets `upstream_rsrc` to `upstream` and `current_buffer` to `nullptr`. If `initial_size` is specified, sets `next_buffer_size` to at least `initial_size`; otherwise sets `next_buffer_size` to an implementation-defined size.

```
monotonic_buffer_resource(void* buffer, size_t buffer_size, memory_resource* upstream);
```

3 *Preconditions*: `upstream` is the address of a valid memory resource. `buffer_size` is no larger than the number of bytes in `buffer`.

4 *Effects*: Sets `upstream_rsrc` to `upstream`, `current_buffer` to `buffer`, and `next_buffer_size` to `buffer_size` (but not less than 1), then increases `next_buffer_size` by an implementation-defined growth factor (which need not be integral).

```
~monotonic_buffer_resource();
```

5 *Effects*: Calls `release()`.

20.12.6.3 Members [mem.res.monotonic.buffer.mem]

```
void release();
```

1 *Effects*: Calls `upstream_rsrc->deallocate()` as necessary to release all allocated memory.

2 [*Note 1*: The memory is released back to `upstream_rsrc` even if some blocks that were allocated from `this` have not been deallocated from `this`. — *end note*]

```
memory_resource* upstream_resource() const;
```

3 *Returns*: The value of `upstream_rsrc`.

```
void* do_allocate(size_t bytes, size_t alignment) override;
```

4 *Effects*: If the unused space in `current_buffer` can fit a block with the specified `bytes` and `alignment`, then allocate the return block from `current_buffer`; otherwise set `current_buffer` to `upstream_rsrc->allocate(n, m)`, where `n` is not less than `max(bytes, next_buffer_size)` and `m` is not less than `alignment`, and increase `next_buffer_size` by an implementation-defined growth factor (which need not be integral), then allocate the return block from the newly-allocated `current_buffer`.

5 *Returns*: A pointer to allocated storage (6.7.5.5.2) with a size of at least `bytes`. The size and alignment of the allocated memory shall meet the requirements for a class derived from `memory_resource` (20.12.2).

6 *Throws*: Nothing unless `upstream_rsrc->allocate()` throws.

```
void do_deallocate(void* p, size_t bytes, size_t alignment) override;
```

7 *Effects*: None.

8 *Throws*: Nothing.

9 *Remarks*: Memory used by this resource increases monotonically until its destruction.

```
bool do_is_equal(const memory_resource& other) const noexcept override;
```

10 *Returns*: `this == &other`.

20.13 Class template scoped_allocator_adaptor [allocator.adaptor]

20.13.1 Header <scoped_allocator> synopsis [allocator.adaptor.syn]

```
namespace std {
  // class template scoped allocator adaptor
  template<class OuterAlloc, class... InnerAlloc>
    class scoped_allocator_adaptor;

  // 20.13.5, scoped allocator operators
  template<class OuterA1, class OuterA2, class... InnerAllocs>
    bool operator==(const scoped_allocator_adaptor<OuterA1, InnerAllocs...>& a,
                    const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& b) noexcept;
}
```

1 The class template `scoped_allocator_adaptor` is an allocator template that specifies an allocator resource (the outer allocator) to be used by a container (as any other allocator does) and also specifies an inner allocator resource to be passed to the constructor of every element within the container. This adaptor is instantiated with one outer and zero or more inner allocator types. If instantiated with only one allocator type, the inner allocator becomes the `scoped_allocator_adaptor` itself, thus using the same allocator resource for the container and every element within the container and, if the elements themselves are containers, each of their elements recursively. If instantiated with more than one allocator, the first allocator is the outer allocator for use by the container, the second allocator is passed to the constructors of the container's elements, and, if the elements themselves are containers, the third allocator is passed to the elements' elements, and so on. If containers are nested to a depth greater than the number of allocators, the last allocator is used repeatedly, as in the single-allocator case, for any remaining recursions.

[*Note 1*: The `scoped_allocator_adaptor` is derived from the outer allocator type so it can be substituted for the outer allocator type in most expressions. — *end note*]

```
namespace std {
  template<class OuterAlloc, class... InnerAllocs>
  class scoped_allocator_adaptor : public OuterAlloc {
  private:
    using OuterTraits = allocator_traits<OuterAlloc>;    // exposition only
    scoped_allocator_adaptor<InnerAllocs...> inner;      // exposition only
```

```
public:
  using outer_allocator_type = OuterAlloc;
  using inner_allocator_type = see below;

  using value_type           = typename OuterTraits::value_type;
  using size_type            = typename OuterTraits::size_type;
  using difference_type      = typename OuterTraits::difference_type;
  using pointer              = typename OuterTraits::pointer;
  using const_pointer        = typename OuterTraits::const_pointer;
  using void_pointer         = typename OuterTraits::void_pointer;
  using const_void_pointer   = typename OuterTraits::const_void_pointer;

  using propagate_on_container_copy_assignment = see below;
  using propagate_on_container_move_assignment = see below;
  using propagate_on_container_swap            = see below;
  using is_always_equal                        = see below;

  template<class Tp> struct rebind {
    using other = scoped_allocator_adaptor<
      OuterTraits::template rebind_alloc<Tp>, InnerAllocs...>;
  };

  scoped_allocator_adaptor();
  template<class OuterA2>
    scoped_allocator_adaptor(OuterA2&& outerAlloc,
                             const InnerAllocs&... innerAllocs) noexcept;

  scoped_allocator_adaptor(const scoped_allocator_adaptor& other) noexcept;
  scoped_allocator_adaptor(scoped_allocator_adaptor&& other) noexcept;

  template<class OuterA2>
    scoped_allocator_adaptor(
      const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& other) noexcept;
  template<class OuterA2>
    scoped_allocator_adaptor(
      scoped_allocator_adaptor<OuterA2, InnerAllocs...>&& other) noexcept;

  scoped_allocator_adaptor& operator=(const scoped_allocator_adaptor&) = default;
  scoped_allocator_adaptor& operator=(scoped_allocator_adaptor&&) = default;

  ~scoped_allocator_adaptor();

  inner_allocator_type& inner_allocator() noexcept;
  const inner_allocator_type& inner_allocator() const noexcept;
  outer_allocator_type& outer_allocator() noexcept;
  const outer_allocator_type& outer_allocator() const noexcept;

  [[nodiscard]] pointer allocate(size_type n);
  [[nodiscard]] pointer allocate(size_type n, const_void_pointer hint);
  void deallocate(pointer p, size_type n);
  size_type max_size() const;

  template<class T, class... Args>
    void construct(T* p, Args&&... args);

  template<class T>
    void destroy(T* p);

  scoped_allocator_adaptor select_on_container_copy_construction() const;
};
```

```
  template<class OuterAlloc, class... InnerAllocs>
    scoped_allocator_adaptor(OuterAlloc, InnerAllocs...)
      -> scoped_allocator_adaptor<OuterAlloc, InnerAllocs...>;
}
```

20.13.2 Member types [allocator.adaptor.types]

```
using inner_allocator_type = see below;
```

1 *Type*: `scoped_allocator_adaptor<OuterAlloc>` if `sizeof...(InnerAllocs)` is zero; otherwise, `scoped_allocator_adaptor<InnerAllocs...>`.

```
using propagate_on_container_copy_assignment = see below;
```

2 *Type*: `true_type` if `allocator_traits<A>::propagate_on_container_copy_assignment::value` is `true` for any `A` in the set of `OuterAlloc` and `InnerAllocs...`; otherwise, `false_type`.

```
using propagate_on_container_move_assignment = see below;
```

3 *Type*: `true_type` if `allocator_traits<A>::propagate_on_container_move_assignment::value` is `true` for any `A` in the set of `OuterAlloc` and `InnerAllocs...`; otherwise, `false_type`.

```
using propagate_on_container_swap = see below;
```

4 *Type*: `true_type` if `allocator_traits<A>::propagate_on_container_swap::value` is `true` for any `A` in the set of `OuterAlloc` and `InnerAllocs...`; otherwise, `false_type`.

```
using is_always_equal = see below;
```

5 *Type*: `true_type` if `allocator_traits<A>::is_always_equal::value` is `true` for every `A` in the set of `OuterAlloc` and `InnerAllocs...`; otherwise, `false_type`.

20.13.3 Constructors [allocator.adaptor.cnstr]

```
scoped_allocator_adaptor();
```

1 *Effects*: Value-initializes the `OuterAlloc` base class and the `inner` allocator object.

```
template<class OuterA2>
  scoped_allocator_adaptor(OuterA2&& outerAlloc, const InnerAllocs&... innerAllocs) noexcept;
```

2 *Constraints*: `is_constructible_v<OuterAlloc, OuterA2>` is `true`.

3 *Effects*: Initializes the `OuterAlloc` base class with `std::forward<OuterA2>(outerAlloc)` and `inner` with `innerAllocs...` (hence recursively initializing each allocator within the adaptor with the corresponding allocator from the argument list).

```
scoped_allocator_adaptor(const scoped_allocator_adaptor& other) noexcept;
```

4 *Effects*: Initializes each allocator within the adaptor with the corresponding allocator from `other`.

```
scoped_allocator_adaptor(scoped_allocator_adaptor&& other) noexcept;
```

5 *Effects*: Move constructs each allocator within the adaptor with the corresponding allocator from `other`.

```
template<class OuterA2>
  scoped_allocator_adaptor(
    const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& other) noexcept;
```

6 *Constraints*: `is_constructible_v<OuterAlloc, const OuterA2&>` is `true`.

7 *Effects*: Initializes each allocator within the adaptor with the corresponding allocator from `other`.

```
template<class OuterA2>
  scoped_allocator_adaptor(scoped_allocator_adaptor<OuterA2, InnerAllocs...>&& other) noexcept;
```

8 *Constraints*: `is_constructible_v<OuterAlloc, OuterA2>` is `true`.

9 *Effects*: Initializes each allocator within the adaptor with the corresponding allocator rvalue from `other`.

20.13.4 Members [allocator.adaptor.members]

1 In the `construct` member functions, *`OUTERMOST`*`(x)` is *`OUTERMOST`*`(x.outer_allocator())` if the expression `x.outer_allocator()` is valid (13.10.3) and `x` otherwise; *`OUTERMOST_ALLOC_TRAITS`*`(x)` is `allocator_traits<remove_reference_t<decltype(`*`OUTERMOST`*`(x))>>`.

[*Note 1*: *`OUTERMOST`*`(x)` and *`OUTERMOST_ALLOC_TRAITS`*`(x)` are recursive operations. It is incumbent upon the definition of `outer_allocator()` to ensure that the recursion terminates. It will terminate for all instantiations of `scoped_allocator_adaptor`. — *end note*]

```
inner_allocator_type& inner_allocator() noexcept;
const inner_allocator_type& inner_allocator() const noexcept;
```

2 *Returns*: `*this` if `sizeof...(InnerAllocs)` is zero; otherwise, `inner`.

```
outer_allocator_type& outer_allocator() noexcept;
```

3 *Returns*: `static_cast<OuterAlloc&>(*this)`.

```
const outer_allocator_type& outer_allocator() const noexcept;
```

4 *Returns*: `static_cast<const OuterAlloc&>(*this)`.

```
[[nodiscard]] pointer allocate(size_type n);
```

5 *Returns*: `allocator_traits<OuterAlloc>::allocate(outer_allocator(), n)`.

```
[[nodiscard]] pointer allocate(size_type n, const_void_pointer hint);
```

6 *Returns*: `allocator_traits<OuterAlloc>::allocate(outer_allocator(), n, hint)`.

```
void deallocate(pointer p, size_type n) noexcept;
```

7 *Effects*: As if by: `allocator_traits<OuterAlloc>::deallocate(outer_allocator(), p, n);`

```
size_type max_size() const;
```

8 *Returns*: `allocator_traits<OuterAlloc>::max_size(outer_allocator())`.

```
template<class T, class... Args>
  void construct(T* p, Args&&... args);
```

9 *Effects*: Equivalent to:

```
apply([p, this](auto&&... newargs) {
        OUTERMOST_ALLOC_TRAITS(*this)::construct(
          OUTERMOST(*this), p,
          std::forward<decltype(newargs)>(newargs)...);
      },
      uses_allocator_construction_args<T>(inner_allocator(),
                                          std::forward<Args>(args)...));
```

```
template<class T>
  void destroy(T* p);
```

10 *Effects*: Calls *`OUTERMOST_ALLOC_TRAITS`*`(*this)::destroy(`*`OUTERMOST`*`(*this), p)`.

```
scoped_allocator_adaptor select_on_container_copy_construction() const;
```

11 *Returns*: A new `scoped_allocator_adaptor` object where each allocator `A` in the adaptor is initialized from the result of calling `allocator_traits<A>::select_on_container_copy_construction()` on the corresponding allocator in `*this`.

20.13.5 Operators [scoped.adaptor.operators]

```
template<class OuterA1, class OuterA2, class... InnerAllocs>
  bool operator==(const scoped_allocator_adaptor<OuterA1, InnerAllocs...>& a,
                  const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& b) noexcept;
```

1 *Returns*: If `sizeof...(InnerAllocs)` is zero,

```
a.outer_allocator() == b.outer_allocator()
```

otherwise

```
a.outer_allocator() == b.outer_allocator() && a.inner_allocator() == b.inner_allocator()
```

20.14 Function objects [function.objects]

20.14.1 General [function.objects.general]

1 A *function object type* is an object type (6.8) that can be the type of the *postfix-expression* in a function call (7.6.1.3, 12.4.2.2).[225] A *function object* is an object of a function object type. In the places where one would expect to pass a pointer to a function to an algorithmic template (Clause 25), the interface is specified to accept a function object. This not only makes algorithmic templates work with pointers to functions, but also enables them to work with arbitrary function objects.

20.14.2 Header <functional> synopsis [functional.syn]

```
namespace std {
  // 20.14.5, invoke
  template<class F, class... Args>
    constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
      noexcept(is_nothrow_invocable_v<F, Args...>);

  // 20.14.6, reference_wrapper
  template<class T> class reference_wrapper;

  template<class T> constexpr reference_wrapper<T> ref(T&) noexcept;
  template<class T> constexpr reference_wrapper<const T> cref(const T&) noexcept;
  template<class T> void ref(const T&&) = delete;
  template<class T> void cref(const T&&) = delete;

  template<class T> constexpr reference_wrapper<T> ref(reference_wrapper<T>) noexcept;
  template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T>) noexcept;

  // 20.14.7, arithmetic operations
  template<class T = void> struct plus;
  template<class T = void> struct minus;
  template<class T = void> struct multiplies;
  template<class T = void> struct divides;
  template<class T = void> struct modulus;
  template<class T = void> struct negate;
  template<> struct plus<void>;
  template<> struct minus<void>;
  template<> struct multiplies<void>;
  template<> struct divides<void>;
  template<> struct modulus<void>;
  template<> struct negate<void>;

  // 20.14.8, comparisons
  template<class T = void> struct equal_to;
  template<class T = void> struct not_equal_to;
  template<class T = void> struct greater;
  template<class T = void> struct less;
  template<class T = void> struct greater_equal;
  template<class T = void> struct less_equal;
  template<> struct equal_to<void>;
  template<> struct not_equal_to<void>;
  template<> struct greater<void>;
  template<> struct less<void>;
  template<> struct greater_equal<void>;
  template<> struct less_equal<void>;

  // 20.14.8.8, class compare_three_way
  struct compare_three_way;
```

225) Such a type is a function pointer or a class type which has a member `operator()` or a class type which has a conversion to a pointer to function.

```
// 20.14.10, logical operations
template<class T = void> struct logical_and;
template<class T = void> struct logical_or;
template<class T = void> struct logical_not;
template<> struct logical_and<void>;
template<> struct logical_or<void>;
template<> struct logical_not<void>;

// 20.14.11, bitwise operations
template<class T = void> struct bit_and;
template<class T = void> struct bit_or;
template<class T = void> struct bit_xor;
template<class T = void> struct bit_not;
template<> struct bit_and<void>;
template<> struct bit_or<void>;
template<> struct bit_xor<void>;
template<> struct bit_not<void>;

// 20.14.12, identity
struct identity;

// 20.14.13, function template not_fn
template<class F> constexpr unspecified not_fn(F&& f);

// 20.14.14, function template bind_front
template<class F, class... Args> constexpr unspecified bind_front(F&&, Args&&...);

// 20.14.15, bind
template<class T> struct is_bind_expression;
template<class T>
  inline constexpr bool is_bind_expression_v = is_bind_expression<T>::value;
template<class T> struct is_placeholder;
template<class T>
  inline constexpr int is_placeholder_v = is_placeholder<T>::value;

template<class F, class... BoundArgs>
  constexpr unspecified bind(F&&, BoundArgs&&...);
template<class R, class F, class... BoundArgs>
  constexpr unspecified bind(F&&, BoundArgs&&...);

namespace placeholders {
  // M is the implementation-defined number of placeholders
  see below _1;
  see below _2;
             .
             .
             .
  see below _M;
}

// 20.14.16, member function adaptors
template<class R, class T>
  constexpr unspecified mem_fn(R T::*) noexcept;

// 20.14.17, polymorphic function wrappers
class bad_function_call;

template<class> class function;       // not defined
template<class R, class... ArgTypes> class function<R(ArgTypes...)>;

template<class R, class... ArgTypes>
  void swap(function<R(ArgTypes...)>&, function<R(ArgTypes...)>&) noexcept;
```

```
  template<class R, class... ArgTypes>
    bool operator==(const function<R(ArgTypes...)>&, nullptr_t) noexcept;

  // 20.14.18, searchers
  template<class ForwardIterator, class BinaryPredicate = equal_to<>>
    class default_searcher;

  template<class RandomAccessIterator,
           class Hash = hash<typename iterator_traits<RandomAccessIterator>::value_type>,
           class BinaryPredicate = equal_to<>>
    class boyer_moore_searcher;

  template<class RandomAccessIterator,
           class Hash = hash<typename iterator_traits<RandomAccessIterator>::value_type>,
           class BinaryPredicate = equal_to<>>
    class boyer_moore_horspool_searcher;

  // 20.14.19, class template hash
  template<class T>
    struct hash;

  namespace ranges {
    // 20.14.9, concept-constrained comparisons
    struct equal_to;
    struct not_equal_to;
    struct greater;
    struct less;
    struct greater_equal;
    struct less_equal;
  }
}
```

1 [*Example 1*: If a C++ program wants to have a by-element addition of two vectors `a` and `b` containing `double` and put the result into `a`, it can do:

```
transform(a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
```

— *end example*]

2 [*Example 2*: To negate every element of `a`:

```
transform(a.begin(), a.end(), a.begin(), negate<double>());
```

— *end example*]

20.14.3 Definitions [func.def]

1 The following definitions apply to this Clause:

2 A *call signature* is the name of a return type followed by a parenthesized comma-separated list of zero or more argument types.

3 A *callable type* is a function object type (20.14) or a pointer to member.

4 A *callable object* is an object of a callable type.

5 A *call wrapper type* is a type that holds a callable object and supports a call operation that forwards to that object.

6 A *call wrapper* is an object of a call wrapper type.

7 A *target object* is the callable object held by a call wrapper.

8 A call wrapper type may additionally hold a sequence of objects and references that may be passed as arguments to the target object. These entities are collectively referred to as *bound argument entities*.

9 The target object and bound argument entities of the call wrapper are collectively referred to as *state entities*.

20.14.4 Requirements [func.require]

1 Define *INVOKE*(f, t_1, t_2, ..., t_N) as follows:

(1.1) — $(\texttt{t}_1\texttt{.*f})(\texttt{t}_2, \ldots, \texttt{t}_N)$ when `f` is a pointer to a member function of a class `T` and `is_base_of_v<T, remove_reference_t<decltype(`$\texttt{t}_1$`)>>` is `true`;

(1.2) — $(\texttt{t}_1\texttt{.get().*f})(\texttt{t}_2, \ldots, \texttt{t}_N)$ when `f` is a pointer to a member function of a class `T` and `remove_cvref_t<decltype(`$\texttt{t}_1$`)>` is a specialization of `reference_wrapper`;

(1.3) — $((\texttt{*t}_1)\texttt{.*f})(\texttt{t}_2, \ldots, \texttt{t}_N)$ when `f` is a pointer to a member function of a class `T` and $\texttt{t}_1$ does not satisfy the previous two items;

(1.4) — $\texttt{t}_1\texttt{.*f}$ when `N == 1` and `f` is a pointer to data member of a class `T` and `is_base_of_v<T, remove_reference_t<decltype(`$\texttt{t}_1$`)>>` is `true`;

(1.5) — $\texttt{t}_1\texttt{.get().*f}$ when `N == 1` and `f` is a pointer to data member of a class `T` and `remove_cvref_t<decltype(`$\texttt{t}_1$`)>` is a specialization of `reference_wrapper`;

(1.6) — $(\texttt{*t}_1)\texttt{.*f}$ when `N == 1` and `f` is a pointer to data member of a class `T` and $\texttt{t}_1$ does not satisfy the previous two items;

(1.7) — $\texttt{f}(\texttt{t}_1, \texttt{t}_2, \ldots, \texttt{t}_N)$ in all other cases.

2 Define *INVOKE*`<R>`$(\texttt{f}, \texttt{t}_1, \texttt{t}_2, \ldots, \texttt{t}_N)$ as `static_cast<void>(`*INVOKE*$(\texttt{f}, \texttt{t}_1, \texttt{t}_2, \ldots, \texttt{t}_N)$`)` if `R` is *cv* `void`, otherwise *INVOKE*$(\texttt{f}, \texttt{t}_1, \texttt{t}_2, \ldots, \texttt{t}_N)$ implicitly converted to `R`.

3 Every call wrapper (20.14.3) meets the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements. An *argument forwarding call wrapper* is a call wrapper that can be called with an arbitrary argument list and delivers the arguments to the wrapped callable object as references. This forwarding step delivers rvalue arguments as rvalue references and lvalue arguments as lvalue references.

[*Note 1*: In a typical implementation, argument forwarding call wrappers have an overloaded function call operator of the form

```
template<class... UnBoundArgs>
  constexpr R operator()(UnBoundArgs&&... unbound_args) cv-qual;
```

— *end note*]

4 A *perfect forwarding call wrapper* is an argument forwarding call wrapper that forwards its state entities to the underlying call expression. This forwarding step delivers a state entity of type `T` as *cv* `T&` when the call is performed on an lvalue of the call wrapper type and as *cv* `T&&` otherwise, where *cv* represents the cv-qualifiers of the call wrapper and where *cv* shall be neither `volatile` nor `const volatile`.

5 A *call pattern* defines the semantics of invoking a perfect forwarding call wrapper. A postfix call performed on a perfect forwarding call wrapper is expression-equivalent (3.21) to an expression `e` determined from its call pattern `cp` by replacing all occurrences of the arguments of the call wrapper and its state entities with references as described in the corresponding forwarding steps.

6 A *simple call wrapper* is a perfect forwarding call wrapper that meets the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements and whose copy constructor, move constructor, and assignment operators are constexpr functions that do not throw exceptions.

7 The copy/move constructor of an argument forwarding call wrapper has the same apparent semantics as if memberwise copy/move of its state entities were performed (11.4.5.3).

[*Note 2*: This implies that each of the copy/move constructors has the same exception-specification as the corresponding implicit definition and is declared as `constexpr` if the corresponding implicit definition would be considered to be constexpr. — *end note*]

8 Argument forwarding call wrappers returned by a given standard library function template have the same type if the types of their corresponding state entities are the same.

20.14.5 Function template `invoke` [func.invoke]

```
template<class F, class... Args>
  constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
    noexcept(is_nothrow_invocable_v<F, Args...>);
```

1 *Returns*: *INVOKE*`(std::forward<F>(f), std::forward<Args>(args)...)` (20.14.4).

20.14.6 Class template `reference_wrapper` [refwrap]

20.14.6.1 General [refwrap.general]

```
namespace std {
```

```
template<class T> class reference_wrapper {
public:
  // types
  using type = T;

  // construct/copy/destroy
  template<class U>
    constexpr reference_wrapper(U&&) noexcept(see below);
  constexpr reference_wrapper(const reference_wrapper& x) noexcept;

  // assignment
  constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;

  // access
  constexpr operator T& () const noexcept;
  constexpr T& get() const noexcept;

  // invocation
  template<class... ArgTypes>
    constexpr invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&...) const;
};

template<class T>
  reference_wrapper(T&) -> reference_wrapper<T>;
}
```

1 `reference_wrapper<T>` is a *Cpp17CopyConstructible* and *Cpp17CopyAssignable* wrapper around a reference to an object or function of type `T`.

2 `reference_wrapper<T>` is a trivially copyable type (6.8).

3 The template parameter `T` of `reference_wrapper` may be an incomplete type.

20.14.6.2 Constructors and destructor [refwrap.const]

```
template<class U>
  constexpr reference_wrapper(U&& u) noexcept(see below);
```

1 Let *`FUN`* denote the exposition-only functions

```
void FUN(T&) noexcept;
void FUN(T&&) = delete;
```

2 *Constraints*: The expression *`FUN`*`(declval<U>())` is well-formed and `is_same_v<remove_cvref_t<U>, reference_wrapper>` is `false`.

3 *Effects*: Creates a variable `r` as if by `T& r = std::forward<U>(u)`, then constructs a `reference_wrapper` object that stores a reference to `r`.

4 *Remarks*: The expression inside `noexcept` is equivalent to `noexcept(`*`FUN`*`(declval<U>()))`.

```
constexpr reference_wrapper(const reference_wrapper& x) noexcept;
```

5 *Effects*: Constructs a `reference_wrapper` object that stores a reference to `x.get()`.

20.14.6.3 Assignment [refwrap.assign]

```
constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;
```

1 *Postconditions*: `*this` stores a reference to `x.get()`.

20.14.6.4 Access [refwrap.access]

```
constexpr operator T& () const noexcept;
```

1 *Returns*: The stored reference.

```
constexpr T& get() const noexcept;
```

2 *Returns*: The stored reference.

20.14.6.5 Invocation [refwrap.invoke]

```
template<class... ArgTypes>
  constexpr invoke_result_t<T&, ArgTypes...>
    operator()(ArgTypes&&... args) const;
```

1 *Mandates*: `T` is a complete type.

2 *Returns*: *`INVOKE`*`(get(), std::forward<ArgTypes>(args)...)`. (20.14.4)

20.14.6.6 Helper functions [refwrap.helpers]

1 The template parameter `T` of the following `ref` and `cref` function templates may be an incomplete type.

```
template<class T> constexpr reference_wrapper<T> ref(T& t) noexcept;
```

2 *Returns*: `reference_wrapper<T>(t)`.

```
template<class T> constexpr reference_wrapper<T> ref(reference_wrapper<T> t) noexcept;
```

3 *Returns*: `ref(t.get())`.

```
template<class T> constexpr reference_wrapper<const T> cref(const T& t) noexcept;
```

4 *Returns*: `reference_wrapper <const T>(t)`.

```
template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T> t) noexcept;
```

5 *Returns*: `cref(t.get())`.

20.14.7 Arithmetic operations [arithmetic.operations]

20.14.7.1 General [arithmetic.operations.general]

1 The library provides basic function object classes for all of the arithmetic operators in the language (7.6.5, 7.6.6).

20.14.7.2 Class template plus [arithmetic.operations.plus]

```
template<class T = void> struct plus {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x + y`.

```
template<> struct plus<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) + std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) + std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) + std::forward<U>(u)`.

20.14.7.3 Class template minus [arithmetic.operations.minus]

```
template<class T = void> struct minus {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x - y`.

```
template<> struct minus<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) - std::forward<U>(u));
```

```
  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) - std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) - std::forward<U>(u)`.

20.14.7.4 Class template multiplies [arithmetic.operations.multiplies]

```
template<class T = void> struct multiplies {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x * y`.

```
template<> struct multiplies<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) * std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) * std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) * std::forward<U>(u)`.

20.14.7.5 Class template divides [arithmetic.operations.divides]

```
template<class T = void> struct divides {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x / y`.

```
template<> struct divides<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) / std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) / std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) / std::forward<U>(u)`.

20.14.7.6 Class template modulus [arithmetic.operations.modulus]

```
template<class T = void> struct modulus {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x % y`.

```
template<> struct modulus<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) % std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) % std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) % std::forward<U>(u)`.

20.14.7.7 Class template `negate` [arithmetic.operations.negate]

```
template<class T = void> struct negate {
  constexpr T operator()(const T& x) const;
};
```

```
constexpr T operator()(const T& x) const;
```

1 *Returns*: `-x`.

```
template<> struct negate<void> {
  template<class T> constexpr auto operator()(T&& t) const
    -> decltype(-std::forward<T>(t));

  using is_transparent = unspecified;
};
```

```
template<class T> constexpr auto operator()(T&& t) const
    -> decltype(-std::forward<T>(t));
```

2 *Returns*: `-std::forward<T>(t)`.

20.14.8 Comparisons [comparisons]

20.14.8.1 General [comparisons.general]

1 The library provides basic function object classes for all of the comparison operators in the language (7.6.9, 7.6.10).

2 For templates `less`, `greater`, `less_equal`, and `greater_equal`, the specializations for any pointer type yield a result consistent with the implementation-defined strict total order over pointers (3.27).

[*Note 1*: If `a < b` is well-defined for pointers `a` and `b` of type `P`, then `(a < b) == less<P>()(a, b)`, `(a > b) == greater<P>()(a, b)`, and so forth. — *end note*]

For template specializations `less<void>`, `greater<void>`, `less_equal<void>`, and `greater_equal<void>`, if the call operator calls a built-in operator comparing pointers, the call operator yields a result consistent with the implementation-defined strict total order over pointers.

20.14.8.2 Class template `equal_to` [comparisons.equal.to]

```
template<class T = void> struct equal_to {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x == y`.

```
template<> struct equal_to<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) == std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) == std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) == std::forward<U>(u)`.

20.14.8.3 Class template `not_equal_to` [comparisons.not.equal.to]

```
template<class T = void> struct not_equal_to {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x != y`.

```
template<> struct not_equal_to<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) != std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) != std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) != std::forward<U>(u)`.

20.14.8.4 Class template `greater` [comparisons.greater]

```
template<class T = void> struct greater {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x > y`.

```
template<> struct greater<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) > std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) > std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) > std::forward<U>(u)`.

20.14.8.5 Class template `less` [comparisons.less]

```
template<class T = void> struct less {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x < y`.

```
template<> struct less<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) < std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) < std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) < std::forward<U>(u)`.

20.14.8.6 Class template `greater_equal` [comparisons.greater.equal]

```
template<class T = void> struct greater_equal {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x >= y`.

```
template<> struct greater_equal<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) >= std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) >= std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) >= std::forward<U>(u)`.

20.14.8.7 Class template `less_equal` [comparisons.less.equal]

```
template<class T = void> struct less_equal {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x <= y`.

```
template<> struct less_equal<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) <= std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) <= std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) <= std::forward<U>(u)`.

20.14.8.8 Class `compare_three_way` [comparisons.three.way]

1 In this subclause, *`BUILTIN-PTR-THREE-WAY`*`(T, U)` for types `T` and `U` is a boolean constant expression. *`BUILTIN-PTR-THREE-WAY`*`(T, U)` is `true` if and only if `<=>` in the expression

```
declval<T>() <=> declval<U>()
```

resolves to a built-in operator comparing pointers.

```
struct compare_three_way {
  template<class T, class U>
    requires three_way_comparable_with<T, U> || BUILTIN-PTR-THREE-WAY(T, U)
  constexpr auto operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

```
template<class T, class U>
  requires three_way_comparable_with<T, U> || BUILTIN-PTR-THREE-WAY(T, U)
constexpr auto operator()(T&& t, U&& u) const;
```

2 *Preconditions*: If the expression `std::forward<T>(t) <=> std::forward<U>(u)` results in a call to a built-in operator `<=>` comparing pointers of type `P`, the conversion sequences from both `T` and `U` to `P` are equality-preserving (18.2).

3 *Effects*:

(3.1) — If the expression `std::forward<T>(t) <=> std::forward<U>(u)` results in a call to a built-in operator `<=>` comparing pointers of type `P`, returns `strong_ordering::less` if (the converted value of) `t` precedes `u` in the implementation-defined strict total order over pointers (3.27), `strong_ordering::greater` if `u` precedes `t`, and otherwise `strong_ordering::equal`.

(3.2) — Otherwise, equivalent to: `return std::forward<T>(t) <=> std::forward<U>(u);`

20.14.9 Concept-constrained comparisons [range.cmp]

1 In this subclause, *BUILTIN-PTR-CMP*(T, *op*, U) for types T and U and where *op* is an equality (7.6.10) or relational operator (7.6.9) is a boolean constant expression. *BUILTIN-PTR-CMP*(T, *op*, U) is true if and only if *op* in the expression declval<T>() *op* declval<U>() resolves to a built-in operator comparing pointers.

```
struct ranges::equal_to {
  template<class T, class U>
    requires equality_comparable_with<T, U> || BUILTIN-PTR-CMP(T, ==, U)
  constexpr bool operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

2 *Preconditions*: If the expression std::forward<T>(t) == std::forward<U>(u) results in a call to a built-in operator == comparing pointers of type P, the conversion sequences from both T and U to P are equality-preserving (18.2).

3 *Effects*:

(3.1) — If the expression std::forward<T>(t) == std::forward<U>(u) results in a call to a built-in operator == comparing pointers: returns false if either (the converted value of) t precedes u or u precedes t in the implementation-defined strict total order over pointers (3.27) and otherwise true.

(3.2) — Otherwise, equivalent to: return std::forward<T>(t) == std::forward<U>(u);

```
struct ranges::not_equal_to {
  template<class T, class U>
    requires equality_comparable_with<T, U> || BUILTIN-PTR-CMP(T, ==, U)
  constexpr bool operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

4 operator() has effects equivalent to:

```
return !ranges::equal_to{}(std::forward<T>(t), std::forward<U>(u));
```

```
struct ranges::greater {
  template<class T, class U>
    requires totally_ordered_with<T, U> || BUILTIN-PTR-CMP(U, <, T)
  constexpr bool operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

5 operator() has effects equivalent to:

```
return ranges::less{}(std::forward<U>(u), std::forward<T>(t));
```

```
struct ranges::less {
  template<class T, class U>
    requires totally_ordered_with<T, U> || BUILTIN-PTR-CMP(T, <, U)
  constexpr bool operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

6 *Preconditions*: If the expression std::forward<T>(t) < std::forward<U>(u) results in a call to a built-in operator < comparing pointers of type P, the conversion sequences from both T and U to P are equality-preserving (18.2). For any expressions ET and EU such that decltype((ET)) is T and decltype((EU)) is U, exactly one of ranges::less{}(ET, EU), ranges::less{}(EU, ET), or ranges::equal_to{}(ET, EU) is true.

7 *Effects*:

(7.1) — If the expression std::forward<T>(t) < std::forward<U>(u) results in a call to a built-in operator < comparing pointers: returns true if (the converted value of) t precedes u in the implementation-defined strict total order over pointers (3.27) and otherwise false.

(7.2) — Otherwise, equivalent to: `return std::forward<T>(t) < std::forward<U>(u);`

```
struct ranges::greater_equal {
  template<class T, class U>
    requires totally_ordered_with<T, U> || BUILTIN-PTR-CMP(T, <, U)
  constexpr bool operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

8 `operator()` has effects equivalent to:

```
return !ranges::less{}(std::forward<T>(t), std::forward<U>(u));
```

```
struct ranges::less_equal {
  template<class T, class U>
    requires totally_ordered_with<T, U> || BUILTIN-PTR-CMP(U, <, T)
  constexpr bool operator()(T&& t, U&& u) const;

  using is_transparent = unspecified;
};
```

9 `operator()` has effects equivalent to:

```
return !ranges::less{}(std::forward<U>(u), std::forward<T>(t));
```

20.14.10 Logical operations [logical.operations]

20.14.10.1 General [logical.operations.general]

1 The library provides basic function object classes for all of the logical operators in the language (7.6.14, 7.6.15, 7.6.2.2).

20.14.10.2 Class template `logical_and` [logical.operations.and]

```
template<class T = void> struct logical_and {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x && y`.

```
template<> struct logical_and<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) && std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) && std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) && std::forward<U>(u)`.

20.14.10.3 Class template `logical_or` [logical.operations.or]

```
template<class T = void> struct logical_or {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

```
constexpr bool operator()(const T& x, const T& y) const;
```

1 *Returns*: `x || y`.

```
template<> struct logical_or<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) || std::forward<U>(u));
```

```
  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) || std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) || std::forward<U>(u)`.

20.14.10.4 Class template `logical_not` [logical.operations.not]

```
template<class T = void> struct logical_not {
  constexpr bool operator()(const T& x) const;
};
```

```
constexpr bool operator()(const T& x) const;
```

1 *Returns*: `!x`.

```
template<> struct logical_not<void> {
  template<class T> constexpr auto operator()(T&& t) const
    -> decltype(!std::forward<T>(t));

  using is_transparent = unspecified;
};
```

```
template<class T> constexpr auto operator()(T&& t) const
    -> decltype(!std::forward<T>(t));
```

2 *Returns*: `!std::forward<T>(t)`.

20.14.11 Bitwise operations [bitwise.operations]

20.14.11.1 General [bitwise.operations.general]

1 The library provides basic function object classes for all of the bitwise operators in the language (7.6.11, 7.6.13, 7.6.12, 7.6.2.2).

20.14.11.2 Class template `bit_and` [bitwise.operations.and]

```
template<class T = void> struct bit_and {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x & y`.

```
template<> struct bit_and<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) & std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) & std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) & std::forward<U>(u)`.

20.14.11.3 Class template `bit_or` [bitwise.operations.or]

```
template<class T = void> struct bit_or {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x | y`.

```
template<> struct bit_or<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) | std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) | std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) | std::forward<U>(u)`.

20.14.11.4 Class template `bit_xor` [bitwise.operations.xor]

```
template<class T = void> struct bit_xor {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```
constexpr T operator()(const T& x, const T& y) const;
```

1 *Returns*: `x ^ y`.

```
template<> struct bit_xor<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));

  using is_transparent = unspecified;
};
```

```
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));
```

2 *Returns*: `std::forward<T>(t) ^ std::forward<U>(u)`.

20.14.11.5 Class template `bit_not` [bitwise.operations.not]

```
template<class T = void> struct bit_not {
  constexpr T operator()(const T& x) const;
};
```

```
constexpr T operator()(const T& x) const;
```

1 *Returns*: `~x`.

```
template<> struct bit_not<void> {
  template<class T> constexpr auto operator()(T&& t) const
    -> decltype(~std::forward<T>(t));

  using is_transparent = unspecified;
};
```

```
template<class T> constexpr auto operator()(T&&) const
    -> decltype(~std::forward<T>(t));
```

2 *Returns*: `~std::forward<T>(t)`.

20.14.12 Class `identity` [func.identity]

```
struct identity {
  template<class T>
    constexpr T&& operator()(T&& t) const noexcept;

  using is_transparent = unspecified;
};
```

```
template<class T>
  constexpr T&& operator()(T&& t) const noexcept;
```

1 *Effects*: Equivalent to: `return std::forward<T>(t);`

20.14.13 Function template `not_fn` [func.not.fn]

```
template<class F> constexpr unspecified not_fn(F&& f);
```

1 In the text that follows:

(1.1) — `g` is a value of the result of a `not_fn` invocation,

(1.2) — `FD` is the type `decay_t<F>`,

(1.3) — `fd` is the target object of `g` (20.14.3) of type `FD`, direct-non-list-initialized with `std::forward<F>(f)`,

(1.4) — `call_args` is an argument pack used in a function call expression (7.6.1.3) of `g`.

2 *Mandates*: `is_constructible_v<FD, F> && is_move_constructible_v<FD>` is `true`.

3 *Preconditions*: `FD` meets the *Cpp17MoveConstructible* requirements.

4 *Returns*: A perfect forwarding call wrapper `g` with call pattern `!invoke(fd, call_args...)`.

5 *Throws*: Any exception thrown by the initialization of `fd`.

20.14.14 Function template `bind_front` [func.bind.front]

```
template<class F, class... Args>
  constexpr unspecified bind_front(F&& f, Args&&... args);
```

1 In the text that follows:

(1.1) — `g` is a value of the result of a `bind_front` invocation,

(1.2) — `FD` is the type `decay_t<F>`,

(1.3) — `fd` is the target object of `g` (20.14.3) of type `FD`, direct-non-list-initialized with `std::forward<F>(f)`,

(1.4) — `BoundArgs` is a pack that denotes `decay_t<Args>...`,

(1.5) — `bound_args` is a pack of bound argument entities of `g` (20.14.3) of types `BoundArgs...`, direct-non-list-initialized with `std::forward<Args>(args)...`, respectively, and

(1.6) — `call_args` is an argument pack used in a function call expression (7.6.1.3) of `g`.

2 *Mandates*:

```
is_constructible_v<FD, F> &&
is_move_constructible_v<FD> &&
(is_constructible_v<BoundArgs, Args> && ...) &&
(is_move_constructible_v<BoundArgs> && ...)
```

is `true`.

3 *Preconditions*: `FD` meets the *Cpp17MoveConstructible* requirements. For each T_i in `BoundArgs`, if T_i is an object type, T_i meets the *Cpp17MoveConstructible* requirements.

4 *Returns*: A perfect forwarding call wrapper `g` with call pattern `invoke(fd, bound_args..., call_args...)`.

5 *Throws*: Any exception thrown by the initialization of the state entities of `g` (20.14.3).

20.14.15 Function object binders [func.bind]

20.14.15.1 General [func.bind.general]

1 Subclause 20.14.15 describes a uniform mechanism for binding arguments of callable objects.

20.14.15.2 Class template `is_bind_expression` [func.bind.isbind]

```
namespace std {
  template<class T> struct is_bind_expression;  // see below
}
```

1 The class template `is_bind_expression` can be used to detect function objects generated by `bind`. The function template `bind` uses `is_bind_expression` to detect subexpressions.

2 Specializations of the `is_bind_expression` template shall meet the *Cpp17UnaryTypeTrait* requirements (20.15.2). The implementation provides a definition that has a base characteristic of `true_type` if `T` is a type

returned from `bind`, otherwise it has a base characteristic of `false_type`. A program may specialize this template for a program-defined type `T` to have a base characteristic of `true_type` to indicate that `T` should be treated as a subexpression in a `bind` call.

20.14.15.3 Class template `is_placeholder` [func.bind.isplace]

```
namespace std {
  template<class T> struct is_placeholder;       // see below
}
```

1 The class template `is_placeholder` can be used to detect the standard placeholders `_1`, `_2`, and so on. The function template `bind` uses `is_placeholder` to detect placeholders.

2 Specializations of the `is_placeholder` template shall meet the *Cpp17UnaryTypeTrait* requirements (20.15.2). The implementation provides a definition that has the base characteristic of `integral_constant<int, J>` if `T` is the type of `std::placeholders::_J`, otherwise it has a base characteristic of `integral_constant<int, 0>`. A program may specialize this template for a program-defined type `T` to have a base characteristic of `integral_constant<int, N>` with `N > 0` to indicate that `T` should be treated as a placeholder type.

20.14.15.4 Function template `bind` [func.bind.bind]

1 In the text that follows:

(1.1) — `g` is a value of the result of a `bind` invocation,

(1.2) — `FD` is the type `decay_t<F>`,

(1.3) — `fd` is an lvalue that is a target object of `g` (20.14.3) of type `FD` direct-non-list-initialized with `std::forward<F>(f)`,

(1.4) — $\mathtt{T}_i$ is the i^{th} type in the template parameter pack `BoundArgs`,

(1.5) — $\mathtt{TD}_i$ is the type $\mathtt{decay\_t<T}_i\mathtt{>}$,

(1.6) — $\mathtt{t}_i$ is the i^{th} argument in the function parameter pack `bound_args`,

(1.7) — $\mathtt{td}_i$ is a bound argument entity of `g` (20.14.3) of type $\mathtt{TD}_i$ direct-non-list-initialized with $\mathtt{std::forward<T}_i\mathtt{>(t}_i\mathtt{)}$,

(1.8) — $\mathtt{U}_j$ is the j^{th} deduced type of the `UnBoundArgs&&...` parameter of the argument forwarding call wrapper, and

(1.9) — $\mathtt{u}_j$ is the j^{th} argument associated with $\mathtt{U}_j$.

```
template<class F, class... BoundArgs>
  constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);
template<class R, class F, class... BoundArgs>
  constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);
```

2 *Mandates*: `is_constructible_v<FD, F>` is `true`. For each $\mathtt{T}_i$ in `BoundArgs`, $\mathtt{is\_constructible\_v<TD}_i\mathtt{, T}_i\mathtt{>}$ is `true`.

3 *Preconditions*: `FD` and each $\mathtt{TD}_i$ meet the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements. $\mathit{INVOKE}\mathtt{(fd, w}_1\mathtt{, w}_2\mathtt{, \ldots, w}_N\mathtt{)}$ (20.14.4) is a valid expression for some values $\mathtt{w}_1, \mathtt{w}_2, \ldots, \mathtt{w}_N$, where N has the value `sizeof...(bound_args)`.

4 *Returns*: An argument forwarding call wrapper `g` (20.14.4). A program that attempts to invoke a volatile-qualified `g` is ill-formed. When `g` is not volatile-qualified, invocation of $\mathtt{g(u}_1\mathtt{, u}_2\mathtt{, \ldots, u}_M\mathtt{)}$ is expression-equivalent (3.21) to

$$\mathit{INVOKE}\mathtt{(static\_cast<V_{fd}>(v_{fd}),}\quad \mathtt{static\_cast<V_1>(v_1), static\_cast<V_2>(v_2), \ldots, static\_cast<V_N>(v_N))}$$

for the first overload, and

$$\mathit{INVOKE}\mathtt{<R>(static\_cast<V_{fd}>(v_{fd}),}\quad \mathtt{static\_cast<V_1>(v_1), static\_cast<V_2>(v_2), \ldots, static\_cast<V_N>(v_N))}$$

for the second overload, where the values and types of the target argument $\mathtt{v_{fd}}$ and of the bound arguments $\mathtt{v}_1, \mathtt{v}_2, \ldots, \mathtt{v}_N$ are determined as specified below.

5 *Throws*: Any exception thrown by the initialization of the state entities of `g`.

6 [*Note 1*: If all of `FD` and $\mathtt{TD}_i$ meet the requirements of *Cpp17CopyConstructible*, then the return type meets the requirements of *Cpp17CopyConstructible*. — *end note*]

7 The values of the *bound arguments* $\texttt{v}_1$, $\texttt{v}_2$, …, $\texttt{v}_N$ and their corresponding types $\texttt{V}_1$, $\texttt{V}_2$, …, $\texttt{V}_N$ depend on the types $\texttt{TD}_i$ derived from the call to `bind` and the cv-qualifiers *cv* of the call wrapper `g` as follows:

(7.1) — if $\texttt{TD}_i$ is `reference_wrapper<T>`, the argument is $\texttt{td}_i$`.get()` and its type $\texttt{V}_i$ is `T&`;

(7.2) — if the value of `is_bind_expression_v<`$\texttt{TD}_i$`>` is `true`, the argument is

```
static_cast<cv TDi&>(tdi)(std::forward<Uj>(uj)...)
```

and its type $\texttt{V}_i$ is `invoke_result_t<`*cv* $\texttt{TD}_i$`&, `$\texttt{U}_j$`...>&&`;

(7.3) — if the value `j` of `is_placeholder_v<`$\texttt{TD}_i$`>` is not zero, the argument is `std::forward<`$\texttt{U}_j$`>(`$\texttt{u}_j$`)` and its type $\texttt{V}_i$ is $\texttt{U}_j$`&&`;

(7.4) — otherwise, the value is $\texttt{td}_i$ and its type $\texttt{V}_i$ is *cv* $\texttt{TD}_i$`&`.

8 The value of the target argument $\texttt{v}_{\texttt{fd}}$ is `fd` and its corresponding type $\texttt{V}_{\texttt{fd}}$ is *cv* `FD&`.

20.14.15.5 Placeholders [func.bind.place]

```
namespace std::placeholders {
  // M is the implementation-defined number of placeholders
  see below _1;
  see below _2;
              .
              .
              .
  see below _M;
}
```

1 All placeholder types meet the *Cpp17DefaultConstructible* and *Cpp17CopyConstructible* requirements, and their default constructors and copy/move constructors are constexpr functions that do not throw exceptions. It is implementation-defined whether placeholder types meet the *Cpp17CopyAssignable* requirements, but if so, their copy assignment operators are constexpr functions that do not throw exceptions.

2 Placeholders should be defined as:

```
inline constexpr unspecified _1{};
```

If they are not, they are declared as:

```
extern unspecified _1;
```

20.14.16 Function template `mem_fn` [func.memfn]

```
template<class R, class T> constexpr unspecified mem_fn(R T::* pm) noexcept;
```

1 *Returns*: A simple call wrapper (20.14.3) `fn` with call pattern `invoke(pmd, call_args...)`, where `pmd` is the target object of `fn` of type `R T::*` direct-non-list-initialized with `pm`, and `call_args` is an argument pack used in a function call expression (7.6.1.3) of `pm`.

20.14.17 Polymorphic function wrappers [func.wrap]

20.14.17.1 General [func.wrap.general]

1 Subclause 20.14.17 describes a polymorphic wrapper class that encapsulates arbitrary callable objects.

20.14.17.2 Class `bad_function_call` [func.wrap.badcall]

1 An exception of type `bad_function_call` is thrown by `function::operator()` (20.14.17.3.5) when the function wrapper object has no target.

```
namespace std {
  class bad_function_call : public exception {
  public:
    // see 17.9.3 for the specification of the special member functions
    const char* what() const noexcept override;
  };
}
```

```
const char* what() const noexcept override;
```

2 *Returns*: An implementation-defined NTBS.

20.14.17.3 Class template `function` [func.wrap.func]

20.14.17.3.1 General [func.wrap.func.general]

```
namespace std {
  template<class> class function;       // not defined

  template<class R, class... ArgTypes>
  class function<R(ArgTypes...)> {
  public:
    using result_type = R;

    // 20.14.17.3.2, construct/copy/destroy
    function() noexcept;
    function(nullptr_t) noexcept;
    function(const function&);
    function(function&&) noexcept;
    template<class F> function(F);

    function& operator=(const function&);
    function& operator=(function&&);
    function& operator=(nullptr_t) noexcept;
    template<class F> function& operator=(F&&);
    template<class F> function& operator=(reference_wrapper<F>) noexcept;

    ~function();

    // 20.14.17.3.3, function modifiers
    void swap(function&) noexcept;

    // 20.14.17.3.4, function capacity
    explicit operator bool() const noexcept;

    // 20.14.17.3.5, function invocation
    R operator()(ArgTypes...) const;

    // 20.14.17.3.6, function target access
    const type_info& target_type() const noexcept;
    template<class T>       T* target() noexcept;
    template<class T> const T* target() const noexcept;
  };

  template<class R, class... ArgTypes>
    function(R(*)(ArgTypes...)) -> function<R(ArgTypes...)>;

  template<class F> function(F) -> function<see below>;

  // 20.14.17.3.7, null pointer comparison operator functions
  template<class R, class... ArgTypes>
    bool operator==(const function<R(ArgTypes...)>&, nullptr_t) noexcept;

  // 20.14.17.3.8, specialized algorithms
  template<class R, class... ArgTypes>
    void swap(function<R(ArgTypes...)>&, function<R(ArgTypes...)>&) noexcept;
}
```

1 The `function` class template provides polymorphic wrappers that generalize the notion of a function pointer. Wrappers can store, copy, and call arbitrary callable objects (20.14.3), given a call signature (20.14.3), allowing functions to be first-class objects.

2 A callable type (20.14.3) `F` is *Lvalue-Callable* for argument types `ArgTypes` and return type `R` if the expression `INVOKE<R>(declval<F&>(), declval<ArgTypes>()...)`, considered as an unevaluated operand (7.2), is well-formed (20.14.4).

3 The `function` class template is a call wrapper (20.14.3) whose call signature (20.14.3) is `R(ArgTypes...)`.

4 [*Note 1*: The types deduced by the deduction guides for `function` might change in future revisions of C++. — *end note*]

20.14.17.3.2 Constructors and destructor [func.wrap.func.con]

```
function() noexcept;
```

1 *Postconditions*: `!*this`.

```
function(nullptr_t) noexcept;
```

2 *Postconditions*: `!*this`.

```
function(const function& f);
```

3 *Postconditions*: `!*this` if `!f`; otherwise, `*this` targets a copy of `f.target()`.

4 *Throws*: Nothing if `f`'s target is a specialization of `reference_wrapper` or a function pointer. Otherwise, may throw `bad_alloc` or any exception thrown by the copy constructor of the stored callable object.

5 *Recommended practice*: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where `f`'s target is an object holding only a pointer or reference to an object and a member function pointer.

```
function(function&& f) noexcept;
```

6 *Postconditions*: If `!f`, `*this` has no target; otherwise, the target of `*this` is equivalent to the target of `f` before the construction, and `f` is in a valid state with an unspecified value.

7 *Recommended practice*: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where `f`'s target is an object holding only a pointer or reference to an object and a member function pointer.

```
template<class F> function(F f);
```

8 *Constraints*: `F` is Lvalue-Callable (20.14.17.3) for argument types `ArgTypes...` and return type `R`.

9 *Preconditions*: `F` meets the *Cpp17CopyConstructible* requirements.

10 *Postconditions*: `!*this` if any of the following hold:

(10.1) — `f` is a null function pointer value.

(10.2) — `f` is a null member pointer value.

(10.3) — `F` is an instance of the `function` class template, and `!f`.

11 Otherwise, `*this` targets a copy of `f` initialized with `std::move(f)`.

12 *Throws*: Nothing if `f` is a specialization of `reference_wrapper` or a function pointer. Otherwise, may throw `bad_alloc` or any exception thrown by `F`'s copy or move constructor.

13 *Recommended practice*: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where `f` is an object holding only a pointer or reference to an object and a member function pointer.

```
template<class F> function(F) -> function<see below>;
```

14 *Constraints*: `&F::operator()` is well-formed when treated as an unevaluated operand and `decltype(&F::operator())` is of the form `R(G::*)(A...)` *cv* `&`$_{opt}$ `noexcept`$_{opt}$ for a class type `G`.

15 *Remarks*: The deduced type is `function<R(A...)>`.

16 [*Example 1*:

```
void f() {
  int i{5};
  function g = [&](double) { return i; };       // deduces function<int(double)>
}
```

— *end example*]

```
function& operator=(const function& f);
```

17 *Effects*: As if by `function(f).swap(*this);`

18 *Returns*: `*this`.

```
function& operator=(function&& f);
```

19 *Effects*: Replaces the target of `*this` with the target of `f`.

20 *Returns*: `*this`.

```
function& operator=(nullptr_t) noexcept;
```

21 *Effects*: If `*this != nullptr`, destroys the target of `this`.

22 *Postconditions*: `!(*this)`.

23 *Returns*: `*this`.

```
template<class F> function& operator=(F&& f);
```

24 *Constraints*: `decay_t<F>` is Lvalue-Callable (20.14.17.3) for argument types `ArgTypes...` and return type `R`.

25 *Effects*: As if by: `function(std::forward<F>(f)).swap(*this);`

26 *Returns*: `*this`.

```
template<class F> function& operator=(reference_wrapper<F> f) noexcept;
```

27 *Effects*: As if by: `function(f).swap(*this);`

28 *Returns*: `*this`.

```
~function();
```

29 *Effects*: If `*this != nullptr`, destroys the target of `this`.

20.14.17.3.3 Modifiers [func.wrap.func.mod]

```
void swap(function& other) noexcept;
```

1 *Effects*: Interchanges the targets of `*this` and `other`.

20.14.17.3.4 Capacity [func.wrap.func.cap]

```
explicit operator bool() const noexcept;
```

1 *Returns*: `true` if `*this` has a target, otherwise `false`.

20.14.17.3.5 Invocation [func.wrap.func.inv]

```
R operator()(ArgTypes... args) const;
```

1 *Returns*: *`INVOKE`*`<R>(f, std::forward<ArgTypes>(args)...)` (20.14.4), where `f` is the target object (20.14.3) of `*this`.

2 *Throws*: `bad_function_call` if `!*this`; otherwise, any exception thrown by the wrapped callable object.

20.14.17.3.6 Target access [func.wrap.func.targ]

```
const type_info& target_type() const noexcept;
```

1 *Returns*: If `*this` has a target of type `T`, `typeid(T)`; otherwise, `typeid(void)`.

```
template<class T>       T* target() noexcept;
template<class T> const T* target() const noexcept;
```

2 *Returns*: If `target_type() == typeid(T)` a pointer to the stored function target; otherwise a null pointer.

20.14.17.3.7 Null pointer comparison operator functions [func.wrap.func.nullptr]

```
template<class R, class... ArgTypes>
  bool operator==(const function<R(ArgTypes...)>& f, nullptr_t) noexcept;
```

1 *Returns*: `!f`.

20.14.17.3.8 Specialized algorithms [func.wrap.func.alg]

```
template<class R, class... ArgTypes>
  void swap(function<R(ArgTypes...)>& f1, function<R(ArgTypes...)>& f2) noexcept;
```

1 *Effects*: As if by: `f1.swap(f2);`

20.14.18 Searchers [func.search]

20.14.18.1 General [func.search.general]

1 Subclause 20.14.18 provides function object types (20.14) for operations that search for a sequence `[pat_first, pat_last)` in another sequence `[first, last)` that is provided to the object's function call operator. The first sequence (the pattern to be searched for) is provided to the object's constructor, and the second (the sequence to be searched) is provided to the function call operator.

2 Each specialization of a class template specified in 20.14.18 shall meet the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. Template parameters named

(2.1) — `ForwardIterator`,

(2.2) — `ForwardIterator1`,

(2.3) — `ForwardIterator2`,

(2.4) — `RandomAccessIterator`,

(2.5) — `RandomAccessIterator1`,

(2.6) — `RandomAccessIterator2`, and

(2.7) — `BinaryPredicate`

of templates specified in 20.14.18 shall meet the same requirements and semantics as specified in 25.1. Template parameters named `Hash` shall meet the *Cpp17Hash* requirements (Table 34).

3 The Boyer-Moore searcher implements the Boyer-Moore search algorithm. The Boyer-Moore-Horspool searcher implements the Boyer-Moore-Horspool search algorithm. In general, the Boyer-Moore searcher will use more memory and give better runtime performance than Boyer-Moore-Horspool.

20.14.18.2 Class template `default_searcher` [func.search.default]

```
template<class ForwardIterator1, class BinaryPredicate = equal_to<>>
  class default_searcher {
  public:
    constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                               BinaryPredicate pred = BinaryPredicate());

    template<class ForwardIterator2>
      constexpr pair<ForwardIterator2, ForwardIterator2>
        operator()(ForwardIterator2 first, ForwardIterator2 last) const;

  private:
    ForwardIterator1 pat_first_;        // exposition only
    ForwardIterator1 pat_last_;         // exposition only
    BinaryPredicate pred_;              // exposition only
  };
```

```
constexpr default_searcher(ForwardIterator pat_first, ForwardIterator pat_last,
                           BinaryPredicate pred = BinaryPredicate());
```

1 *Effects*: Constructs a `default_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, and `pred_` with `pred`.

2 *Throws*: Any exception thrown by the copy constructor of `BinaryPredicate` or `ForwardIterator1`.

```
template<class ForwardIterator2>
  constexpr pair<ForwardIterator2, ForwardIterator2>
    operator()(ForwardIterator2 first, ForwardIterator2 last) const;
```

3 *Effects*: Returns a pair of iterators `i` and `j` such that

(3.1) — `i == search(first, last, pat_first_, pat_last_, pred_)`, and

(3.2) — if `i == last`, then `j == last`, otherwise `j == next(i, distance(pat_first_, pat_last_))`.

20.14.18.3 Class template `boyer_moore_searcher` [func.search.bm]

```
template<class RandomAccessIterator1,
         class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
         class BinaryPredicate = equal_to<>>
  class boyer_moore_searcher {
  public:
    boyer_moore_searcher(RandomAccessIterator1 pat_first,
                         RandomAccessIterator1 pat_last,
                         Hash hf = Hash(),
                         BinaryPredicate pred = BinaryPredicate());

    template<class RandomAccessIterator2>
      pair<RandomAccessIterator2, RandomAccessIterator2>
        operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

  private:
    RandomAccessIterator1 pat_first_;   // exposition only
    RandomAccessIterator1 pat_last_;    // exposition only
    Hash hash_;                         // exposition only
    BinaryPredicate pred_;              // exposition only
  };
```

```
boyer_moore_searcher(RandomAccessIterator1 pat_first,
                     RandomAccessIterator1 pat_last,
                     Hash hf = Hash(),
                     BinaryPredicate pred = BinaryPredicate());
```

1 *Preconditions*: The value type of `RandomAccessIterator1` meets the *Cpp17DefaultConstructible* requirements, the *Cpp17CopyConstructible* requirements, and the *Cpp17CopyAssignable* requirements.

2 Let `V` be `iterator_traits<RandomAccessIterator1>::value_type`. For any two values `A` and `B` of type `V`, if `pred(A, B) == true`, then `hf(A) == hf(B)` is `true`.

3 *Effects*: Initializes `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.

4 *Throws*: Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1`, or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```
template<class RandomAccessIterator2>
  pair<RandomAccessIterator2, RandomAccessIterator2>
    operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
```

5 *Mandates*: `RandomAccessIterator1` and `RandomAccessIterator2` have the same value type.

6 *Effects*: Finds a subsequence of equal values in a sequence.

7 *Returns*: A pair of iterators `i` and `j` such that

(7.1) — `i` is the first iterator in the range `[first, last - (pat_last_ - pat_first_))` such that for every non-negative integer `n` less than `pat_last_ - pat_first_` the following condition holds: `pred(*(i + n), *(pat_first_ + n)) != false`, and

(7.2) — `j == next(i, distance(pat_first_, pat_last_))`.

Returns `make_pair(first, first)` if `[pat_first_, pat_last_)` is empty, otherwise returns `make_pair(last, last)` if no such iterator is found.

8 *Complexity*: At most `(last - first) * (pat_last_ - pat_first_)` applications of the predicate.

20.14.18.4 Class template `boyer_moore_horspool_searcher` [func.search.bmh]

```
template<class RandomAccessIterator1,
         class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
         class BinaryPredicate = equal_to<>>
  class boyer_moore_horspool_searcher {
```

```
  public:
    boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                                  RandomAccessIterator1 pat_last,
                                  Hash hf = Hash(),
                                  BinaryPredicate pred = BinaryPredicate());

    template<class RandomAccessIterator2>
      pair<RandomAccessIterator2, RandomAccessIterator2>
        operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

  private:
    RandomAccessIterator1 pat_first_;   // exposition only
    RandomAccessIterator1 pat_last_;    // exposition only
    Hash hash_;                         // exposition only
    BinaryPredicate pred_;              // exposition only
  };
```

```
boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                              RandomAccessIterator1 pat_last,
                              Hash hf = Hash(),
                              BinaryPredicate pred = BinaryPredicate());
```

1 *Preconditions*: The value type of `RandomAccessIterator1` meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and *Cpp17CopyAssignable* requirements.

2 Let `V` be `iterator_traits<RandomAccessIterator1>::value_type`. For any two values `A` and `B` of type `V`, if `pred(A, B) == true`, then `hf(A) == hf(B)` is `true`.

3 *Effects*: Initializes `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.

4 *Throws*: Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1` or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```
template<class RandomAccessIterator2>
  pair<RandomAccessIterator2, RandomAccessIterator2>
    operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
```

5 *Mandates*: `RandomAccessIterator1` and `RandomAccessIterator2` have the same value type.

6 *Effects*: Finds a subsequence of equal values in a sequence.

7 *Returns*: A pair of iterators `i` and `j` such that

(7.1) — `i` is the first iterator `i` in the range `[first, last - (pat_last_ - pat_first_))` such that for every non-negative integer `n` less than `pat_last_ - pat_first_` the following condition holds: `pred(*(i + n), *(pat_first_ + n)) != false`, and

(7.2) — `j == next(i, distance(pat_first_, pat_last_))`.

Returns `make_pair(first, first)` if `[pat_first_, pat_last_)` is empty, otherwise returns `make_pair(last, last)` if no such iterator is found.

8 *Complexity*: At most `(last - first) * (pat_last_ - pat_first_)` applications of the predicate.

20.14.19 Class template `hash` [unord.hash]

1 The unordered associative containers defined in 22.5 use specializations of the class template `hash` (20.14.2) as the default hash function.

2 Each specialization of `hash` is either enabled or disabled, as described below.

[*Note 1*: Enabled specializations meet the *Cpp17Hash* requirements, and disabled specializations do not. — *end note*]

Each header that declares the template `hash` provides enabled specializations of `hash` for `nullptr_t` and all cv-unqualified arithmetic, enumeration, and pointer types. For any type `Key` for which neither the library nor the user provides an explicit or partial specialization of the class template `hash`, `hash<Key>` is disabled.

3 If the library provides an explicit or partial specialization of `hash<Key>`, that specialization is enabled except as noted otherwise, and its member functions are `noexcept` except as noted otherwise.

4 If `H` is a disabled specialization of `hash`, these values are `false`: `is_default_constructible_v<H>`, `is_copy_constructible_v<H>`, `is_move_constructible_v<H>`, `is_copy_assignable_v<H>`, and `is_move_assignable_v<H>`. Disabled specializations of `hash` are not function object types (20.14).

[*Note 2*: This means that the specialization of `hash` exists, but any attempts to use it as a *Cpp17Hash* will be ill-formed. — *end note*]

5 An enabled specialization `hash<Key>` will:

(5.1) — meet the *Cpp17Hash* requirements (Table 34), with `Key` as the function call argument type, the *Cpp17DefaultConstructible* requirements (Table 27), the *Cpp17CopyAssignable* requirements (Table 31),

(5.2) — be swappable (16.4.4.3) for lvalues,

(5.3) — meet the requirement that if `k1 == k2` is `true`, `h(k1) == h(k2)` is also `true`, where `h` is an object of type `hash<Key>` and `k1` and `k2` are objects of type `Key`;

(5.4) — meet the requirement that the expression `h(k)`, where `h` is an object of type `hash<Key>` and `k` is an object of type `Key`, shall not throw an exception unless `hash<Key>` is a program-defined specialization that depends on at least one program-defined type.

20.15 Metaprogramming and type traits [meta]

20.15.1 General [meta.general]

1 Subclause 20.15 describes components used by C++ programs, particularly in templates, to support the widest possible range of types, optimise template code usage, detect type related user errors, and perform type inference and transformation at compile time. It includes type classification traits, type property inspection traits, and type transformations. The type classification traits describe a complete taxonomy of all possible C++ types, and state where in that taxonomy a given type belongs. The type property inspection traits allow important characteristics of types or of combinations of types to be inspected. The type transformations allow certain properties of types to be manipulated.

2 All functions specified in 20.15 are signal-safe (17.13.5).

20.15.2 Requirements [meta.rqmts]

1 A *Cpp17UnaryTypeTrait* describes a property of a type. It shall be a class template that takes one template type argument and, optionally, additional arguments that help define the property being described. It shall be *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and publicly and unambiguously derived, directly or indirectly, from its *base characteristic*, which is a specialization of the template `integral_constant` (20.15.4), with the arguments to the template `integral_constant` determined by the requirements for the particular property being described. The member names of the base characteristic shall not be hidden and shall be unambiguously available in the *Cpp17UnaryTypeTrait*.

2 A *Cpp17BinaryTypeTrait* describes a relationship between two types. It shall be a class template that takes two template type arguments and, optionally, additional arguments that help define the relationship being described. It shall be *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and publicly and unambiguously derived, directly or indirectly, from its *base characteristic*, which is a specialization of the template `integral_constant` (20.15.4), with the arguments to the template `integral_constant` determined by the requirements for the particular relationship being described. The member names of the base characteristic shall not be hidden and shall be unambiguously available in the *Cpp17BinaryTypeTrait*.

3 A *Cpp17TransformationTrait* modifies a property of a type. It shall be a class template that takes one template type argument and, optionally, additional arguments that help define the modification. It shall define a publicly accessible nested type named `type`, which shall be a synonym for the modified type.

4 Unless otherwise specified, the behavior of a program that adds specializations for any of the templates specified in 20.15 is undefined.

5 Unless otherwise specified, an incomplete type may be used to instantiate a template specified in 20.15. The behavior of a program is undefined if:

(5.1) — an instantiation of a template specified in 20.15 directly or indirectly depends on an incompletely-defined object type `T`, and

(5.2) — that instantiation could yield a different result were `T` hypothetically completed.

20.15.3 Header <type_traits> synopsis [meta.type.synop]

```
namespace std {

// 20.15.11, constant evaluation context
constexpr bool is_constant_evaluated() noexcept;
}
```

20.15.4 Helper classes [meta.help]

```
namespace std {
  template<class T, T v> struct integral_constant {
    static constexpr T value = v;

    using value_type = T;
    using type = integral_constant<T, v>;

    constexpr operator value_type() const noexcept { return value; }
    constexpr value_type operator()() const noexcept { return value; }
  };
}
```

1 The class template `integral_constant`, alias template `bool_constant`, and its associated *typedef-name*s `true_type` and `false_type` are used as base classes to define the interface for various type traits.

20.15.5 Unary type traits [meta.unary]

20.15.5.1 General [meta.unary.general]

1 Subclause 20.15.5 contains templates that may be used to query the properties of a type at compile time.

2 Each of these templates shall be a *Cpp17UnaryTypeTrait* (20.15.2) with a base characteristic of `true_type` if the corresponding condition is `true`, otherwise `false_type`.

20.15.5.2 Primary type categories [meta.unary.cat]

1 The primary type categories correspond to the descriptions given in subclause 6.8 of the C++ standard.

2 For any given type `T`, the result of applying one of these templates to `T` and to *cv* `T` shall yield the same result.

3 [*Note 1*: For any given type `T`, exactly one of the primary type categories has a `value` member that evaluates to `true`. — *end note*]

Table 47: Primary type category predicates [tab:meta.unary.cat]

Template	Condition	Comments
`template<class T>` `struct is_void;`	`T` is `void`	
`template<class T>` `struct is_null_pointer;`	`T` is `nullptr_t` (6.8.2)	
`template<class T>` `struct is_integral;`	`T` is an integral type (6.8.2)	
`template<class T>` `struct is_floating_point;`	`T` is a floating-point type (6.8.2)	
`template<class T>` `struct is_array;`	`T` is an array type (6.8.3) of known or unknown extent	Class template `array` (22.3.7) is not an array type.
`template<class T>` `struct is_pointer;`	`T` is a pointer type (6.8.3)	Includes pointers to functions but not pointers to non-static members.
`template<class T>` `struct is_lvalue_reference;`	`T` is an lvalue reference type (9.3.4.3)	
`template<class T>` `struct is_rvalue_reference;`	`T` is an rvalue reference type (9.3.4.3)	
`template<class T>` `struct is_member_object_pointer;`	`T` is a pointer to data member	
`template<class T>` `struct is_member_function_pointer;`	`T` is a pointer to member function	
`template<class T>` `struct is_enum;`	`T` is an enumeration type (6.8.3)	
`template<class T>` `struct is_union;`	`T` is a union type (6.8.3)	
`template<class T>` `struct is_class;`	`T` is a non-union class type (6.8.3)	
`template<class T>` `struct is_function;`	`T` is a function type (6.8.3)	

20.15.5.3 Composite type traits [meta.unary.comp]

1 These templates provide convenient compositions of the primary type categories, corresponding to the descriptions given in subclause 6.8.

2 For any given type `T`, the result of applying one of these templates to `T` and to *cv* `T` shall yield the same result.

Table 48: Composite type category predicates [tab:meta.unary.comp]

Template	Condition	Comments
`template<class T>` `struct is_reference;`	`T` is an lvalue reference or an rvalue reference	
`template<class T>` `struct is_arithmetic;`	`T` is an arithmetic type (6.8.2)	
`template<class T>` `struct is_fundamental;`	`T` is a fundamental type (6.8.2)	

Table 48: Composite type category predicates (continued)

Template	Condition	Comments
`template<class T>` `struct is_object;`	`T` is an object type (6.8)	
`template<class T>` `struct is_scalar;`	`T` is a scalar type (6.8)	
`template<class T>` `struct is_compound;`	`T` is a compound type (6.8.3)	
`template<class T>` `struct is_member_pointer;`	`T` is a pointer-to-member type (6.8.3)	

20.15.5.4 Type properties [meta.unary.prop]

1 These templates provide access to some of the more important properties of types.

2 It is unspecified whether the library defines any full or partial specializations of any of these templates.

3 For all of the class templates `X` declared in this subclause, instantiating that template with a template-argument that is a class template specialization may result in the implicit instantiation of the template argument if and only if the semantics of `X` require that the argument is a complete type.

4 For the purpose of defining the templates in this subclause, a function call expression `declval<T>()` for any type `T` is considered to be a trivial (6.8, 11.4.4) function call that is not an odr-use (6.3) of `declval` in the context of the corresponding definition notwithstanding the restrictions of 20.2.6.

Table 49: Type property predicates [tab:meta.unary.prop]

Template	Condition	Preconditions
`template<class T>` `struct is_const;`	`T` is const-qualified (6.8.4)	
`template<class T>` `struct is_volatile;`	`T` is volatile-qualified (6.8.4)	
`template<class T>` `struct is_trivial;`	`T` is a trivial type (6.8)	`remove_all_extents_t<T>` shall be a complete type or *cv* `void`.
`template<class T>` `struct is_trivially_copyable;`	`T` is a trivially copyable type (6.8)	`remove_all_extents_t<T>` shall be a complete type or *cv* `void`.
`template<class T>` `struct is_standard_layout;`	`T` is a standard-layout type (6.8)	`remove_all_extents_t<T>` shall be a complete type or *cv* `void`.
`template<class T>` `struct is_empty;`	`T` is a class type, but not a union type, with no non-static data members other than subobjects of zero size, no virtual member functions, no virtual base classes, and no base class `B` for which `is_empty_v<B>` is `false`.	If `T` is a non-union class type, `T` shall be a complete type.
`template<class T>` `struct is_polymorphic;`	`T` is a polymorphic class (11.7.3)	If `T` is a non-union class type, `T` shall be a complete type.
`template<class T>` `struct is_abstract;`	`T` is an abstract class (11.7.4)	If `T` is a non-union class type, `T` shall be a complete type.

Table 49: Type property predicates (continued)

Template	Condition	Preconditions
`template<class T> struct is_final;`	`T` is a class type marked with the *class-virt-specifier* `final` (11.1). [*Note 1*: A union is a class type that can be marked with `final`. — *end note*]	If `T` is a class type, `T` shall be a complete type.
`template<class T> struct is_aggregate;`	`T` is an aggregate type (9.4.2)	`remove_all_extents_t<T>` shall be a complete type or *cv* `void`.
`template<class T> struct is_signed;`	If `is_arithmetic_v<T>` is `true`, the same result as `T(-1) < T(0)`; otherwise, `false`	
`template<class T> struct is_unsigned;`	If `is_arithmetic_v<T>` is `true`, the same result as `T(0) < T(-1)`; otherwise, `false`	
`template<class T> struct is_bounded_array;`	`T` is an array type of known bound (9.3.4.5)	
`template<class T> struct is_unbounded_array;`	`T` is an array type of unknown bound (9.3.4.5)	
`template<class T, class... Args> struct is_constructible;`	For a function type `T` or for a *cv* `void` type `T`, `is_constructible_v<T, Args...>` is `false`, otherwise *see below*	`T` and all types in the template parameter pack `Args` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T> struct is_default_constructible;`	`is_constructible_v<T>` is `true`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T> struct is_copy_constructible;`	For a referenceable type `T` (3.45), the same result as `is_constructible_v<T, const T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T> struct is_move_constructible;`	For a referenceable type `T`, the same result as `is_constructible_v<T, T&&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.

Table 49: Type property predicates (continued)

Template	Condition	Preconditions
`template<class T, class U> struct is_assignable;`	The expression `declval<T>() = declval<U>()` is well-formed when treated as an unevaluated operand (7.2). Access checking is performed as if in a context unrelated to `T` and `U`. Only the validity of the immediate context of the assignment expression is considered. [*Note 2*: The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*]	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T> struct is_copy_assignable;`	For a referenceable type `T`, the same result as `is_assignable_v<T&, const T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T> struct is_move_assignable;`	For a referenceable type `T`, the same result as `is_assignable_v<T&, T&&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.

Table 49: Type property predicates (continued)

Template	Condition	Preconditions
`template<class T, class U> struct is_swappable_with;`	The expressions `swap(declval<T>(), declval<U>())` and `swap(declval<U>(), declval<T>())` are each well-formed when treated as an unevaluated operand (7.2) in an overload-resolution context for swappable values (16.4.4.3). Access checking is performed as if in a context unrelated to `T` and `U`. Only the validity of the immediate context of the `swap` expressions is considered. [*Note 3*: The compilation of the expressions can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. — *end note*]	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T> struct is_swappable;`	For a referenceable type `T`, the same result as `is_swappable_with_v<T&, T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T> struct is_destructible;`	Either `T` is a reference type, or `T` is a complete object type for which the expression `declval<U&>().~U()` is well-formed when treated as an unevaluated operand (7.2), where `U` is `remove_all_extents_t<T>`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T, class... Args> struct is_trivially_constructible;`	`is_constructible_v<T, Args...>` is `true` and the variable definition for `is_constructible`, as defined below, is known to call no operation that is not trivial (6.8, 11.4.4).	`T` and all types in the template parameter pack `Args` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T> struct is_trivially_default_constructible;`	`is_trivially_constructible_v<T>` is `true`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.

Table 49: Type property predicates (continued)

Template	Condition	Preconditions
template<class T> struct is_trivially_copy_constructible;	For a referenceable type T, the same result as is_trivially_constructible_v<T, const T&>, otherwise false.	T shall be a complete type, *cv* void, or an array of unknown bound.
template<class T> struct is_trivially_move_constructible;	For a referenceable type T, the same result as is_trivially_constructible_v<T, T&&>, otherwise false.	T shall be a complete type, *cv* void, or an array of unknown bound.
template<class T, class U> struct is_trivially_assignable;	is_assignable_v<T, U> is true and the assignment, as defined by is_assignable, is known to call no operation that is not trivial (6.8, 11.4.4).	T and U shall be complete types, *cv* void, or arrays of unknown bound.
template<class T> struct is_trivially_copy_assignable;	For a referenceable type T, the same result as is_trivially_assignable_v<T&, const T&>, otherwise false.	T shall be a complete type, *cv* void, or an array of unknown bound.
template<class T> struct is_trivially_move_assignable;	For a referenceable type T, the same result as is_trivially_assignable_v<T&, T&&>, otherwise false.	T shall be a complete type, *cv* void, or an array of unknown bound.
template<class T> struct is_trivially_destructible;	is_destructible_v<T> is true and remove_all_extents_t<T> is either a non-class type or a class type with a trivial destructor.	T shall be a complete type, *cv* void, or an array of unknown bound.
template<class T, class... Args> struct is_nothrow_constructible;	is_constructible_v<T, Args...> is true and the variable definition for is_constructible, as defined below, is known not to throw any exceptions (7.6.2.7).	T and all types in the template parameter pack Args shall be complete types, *cv* void, or arrays of unknown bound.
template<class T> struct is_nothrow_default_constructible;	is_nothrow_constructible_v<T> is true.	T shall be a complete type, *cv* void, or an array of unknown bound.
template<class T> struct is_nothrow_copy_constructible;	For a referenceable type T, the same result as is_nothrow_constructible_v<T, const T&>, otherwise false.	T shall be a complete type, *cv* void, or an array of unknown bound.
template<class T> struct is_nothrow_move_constructible;	For a referenceable type T, the same result as is_nothrow_constructible_v<T, T&&>, otherwise false.	T shall be a complete type, *cv* void, or an array of unknown bound.

Table 49: Type property predicates (continued)

Template	Condition	Preconditions
`template<class T, class U> struct is_nothrow_assignable;`	`is_assignable_v<T, U>` is `true` and the assignment is known not to throw any exceptions (7.6.2.7).	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T> struct is_nothrow_copy_assignable;`	For a referenceable type `T`, the same result as `is_nothrow_assignable_v<T&, const T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T> struct is_nothrow_move_assignable;`	For a referenceable type `T`, the same result as `is_nothrow_assignable_v<T&, T&&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T, class U> struct is_nothrow_swappable_with;`	`is_swappable_with_v<T, U>` is `true` and each `swap` expression of the definition of `is_swappable_with<T, U>` is known not to throw any exceptions (7.6.2.7).	`T` and `U` shall be complete types, *cv* `void`, or arrays of unknown bound.
`template<class T> struct is_nothrow_swappable;`	For a referenceable type `T`, the same result as `is_nothrow_swappable_with_v<T&, T&>`, otherwise `false`.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T> struct is_nothrow_destructible;`	`is_destructible_v<T>` is `true` and the indicated destructor is known not to throw any exceptions (7.6.2.7).	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.
`template<class T> struct has_virtual_destructor;`	`T` has a virtual destructor (11.4.7)	If `T` is a non-union class type, `T` shall be a complete type.
`template<class T> struct has_unique_object_representations;`	For an array type `T`, the same result as `has_unique_object_representations_v<remove_all_extents_t<T>>`, otherwise *see below*.	`T` shall be a complete type, *cv* `void`, or an array of unknown bound.

5 [*Example 1*:

```
is_const_v<const volatile int>     // true
is_const_v<const int*>             // false
is_const_v<const int&>             // false
is_const_v<int[3]>                 // false
is_const_v<const int[3]>           // true
```

— *end example*]

6 [*Example 2*:

```
remove_const_t<const volatile int>  // volatile int
remove_const_t<const int* const>    // const int*
remove_const_t<const int&>          // const int&
remove_const_t<const int[3]>        // int[3]
```

— *end example*]

7 [*Example 3*:

```
// Given:
struct P final { };
union U1 { };
union U2 final { };

// the following assertions hold:
static_assert(!is_final_v<int>);
static_assert(is_final_v<P>);
static_assert(!is_final_v<U1>);
static_assert(is_final_v<U2>);
```

— *end example*]

8 The predicate condition for a template specialization `is_constructible<T, Args...>` shall be satisfied if and only if the following variable definition would be well-formed for some invented variable `t`:

```
T t(declval<Args>()...);
```

[*Note 4*: These tokens are never interpreted as a function declaration. — *end note*]

Access checking is performed as if in a context unrelated to `T` and any of the `Args`. Only the validity of the immediate context of the variable initialization is considered.

[*Note 5*: The evaluation of the initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*]

9 The predicate condition for a template specialization `has_unique_object_representations<T>` shall be satisfied if and only if:

(9.1) — `T` is trivially copyable, and

(9.2) — any two objects of type `T` with the same value have the same object representation, where two objects of array or non-union class type are considered to have the same value if their respective sequences of direct subobjects have the same values, and two objects of union type are considered to have the same value if they have the same active member and the corresponding members have the same value.

The set of scalar types for which this condition holds is implementation-defined.

[*Note 6*: If a type has padding bits, the condition does not hold; otherwise, the condition holds true for integral types. — *end note*]

20.15.6 Type property queries [meta.unary.prop.query]

1 This subclause contains templates that may be used to query properties of types at compile time.

Table 50: Type property queries [tab:meta.unary.prop.query]

Template	Value
`template<class T>` `struct alignment_of;`	`alignof(T)`. *Mandates*: `alignof(T)` is a valid expression (7.6.2.6)
`template<class T>` `struct rank;`	If `T` names an array type, an integer value representing the number of dimensions of `T`; otherwise, 0.
`template<class T,` `unsigned I = 0>` `struct extent;`	If `T` is not an array type, or if it has rank less than or equal to `I`, or if `I` is 0 and `T` has type "array of unknown bound of `U`", then 0; otherwise, the bound (9.3.4.5) of the `I`$^{\text{th}}$ dimension of `T`, where indexing of `I` is zero-based

2 Each of these templates shall be a *Cpp17UnaryTypeTrait* (20.15.2) with a base characteristic of `integral_constant<size_t, Value>`.

3 [*Example 1*:

```
// the following assertions hold:
assert(rank_v<int> == 0);
assert(rank_v<int[2]> == 1);
assert(rank_v<int[][4]> == 2);
```

— *end example*]

4 [*Example 2*:

```
// the following assertions hold:
assert(extent_v<int> == 0);
assert(extent_v<int[2]> == 2);
assert(extent_v<int[2][4]> == 2);
assert(extent_v<int[][4]> == 0);
assert((extent_v<int, 1>) == 0);
assert((extent_v<int[2], 1>) == 0);
assert((extent_v<int[2][4], 1>) == 4);
assert((extent_v<int[][4], 1>) == 4);
```

— *end example*]

20.15.7 Relationships between types [meta.rel]

1 This subclause contains templates that may be used to query relationships between types at compile time.

2 Each of these templates shall be a *Cpp17BinaryTypeTrait* (20.15.2) with a base characteristic of `true_type` if the corresponding condition is true, otherwise `false_type`.

Table 51: Type relationship predicates [tab:meta.rel]

Template	Condition	Comments
template<class T, class U> struct is_same;	T and U name the same type with the same cv-qualifications	
template<class Base, class Derived> struct is_base_of;	Base is a base class of Derived (11.7) without regard to cv-qualifiers or Base and Derived are not unions and name the same class type without regard to cv-qualifiers	If Base and Derived are non-union class types and are not possibly cv-qualified versions of the same type, Derived shall be a complete type. [*Note 1*: Base classes that are private, protected, or ambiguous are, nonetheless, base classes. — *end note*]
template<class From, class To> struct is_convertible;	*see below*	From and To shall be complete types, *cv* void, or arrays of unknown bound.
template<class From, class To> struct is_nothrow_convertible;	is_convertible_v<From, To> is true and the conversion, as defined by is_convertible, is known not to throw any exceptions (7.6.2.7)	From and To shall be complete types, *cv* void, or arrays of unknown bound.
template<class T, class U> struct is_layout_compatible;	T and U are layout-compatible (6.8)	T and U shall be complete types, *cv* void, or arrays of unknown bound.
template<class Base, class Derived> struct is_pointer_-interconvertible_base_of;	Derived is unambiguously derived from Base without regard to cv-qualifiers, and each object of type Derived is pointer-interconvertible (6.8.3) with its Base subobject, or Base and Derived are not unions and name the same class type without regard to cv-qualifiers.	If Base and Derived are non-union class types and are not (possibly cv-qualified versions of) the same type, Derived shall be a complete type.

Table 51: Type relationship predicates (continued)

Template	Condition	Comments
template<class Fn, class... ArgTypes> struct is_invocable;	The expression *INVOKE*(declval<Fn>(), declval<ArgTypes>()...) is well-formed when treated as an unevaluated operand	Fn and all types in the template parameter pack ArgTypes shall be complete types, *cv* void, or arrays of unknown bound.
template<class R, class Fn, class... ArgTypes> struct is_invocable_r;	The expression *INVOKE*<R>(declval<Fn>(), declval<ArgTypes>()...) is well-formed when treated as an unevaluated operand	Fn, R, and all types in the template parameter pack ArgTypes shall be complete types, *cv* void, or arrays of unknown bound.
template<class Fn, class... ArgTypes> struct is_nothrow_invocable;	is_invocable_v< Fn, ArgTypes...> is true and the expression *INVOKE*(declval<Fn>(), declval<ArgTypes>()...) is known not to throw any exceptions (7.6.2.7)	Fn and all types in the template parameter pack ArgTypes shall be complete types, *cv* void, or arrays of unknown bound.
template<class R, class Fn, class... ArgTypes> struct is_nothrow_invocable_r;	is_invocable_r_v< R, Fn, ArgTypes...> is true and the expression *INVOKE*<R>(declval<Fn>(), declval<ArgTypes>()...) is known not to throw any exceptions (7.6.2.7)	Fn, R, and all types in the template parameter pack ArgTypes shall be complete types, *cv* void, or arrays of unknown bound.

3 For the purpose of defining the templates in this subclause, a function call expression declval<T>() for any type T is considered to be a trivial (6.8, 11.4.4) function call that is not an odr-use (6.3) of declval in the context of the corresponding definition notwithstanding the restrictions of 20.2.6.

4 [*Example 1*:

```
struct B {};
struct B1 : B {};
struct B2 : B {};
struct D : private B1, private B2 {};

is_base_of_v<B, D>              // true
is_base_of_v<const B, D>        // true
is_base_of_v<B, const D>        // true
is_base_of_v<B, const B>        // true
is_base_of_v<D, B>              // false
is_base_of_v<B&, D&>            // false
is_base_of_v<B[3], D[3]>        // false
is_base_of_v<int, int>          // false
```

— *end example*]

5 The predicate condition for a template specialization is_convertible<From, To> shall be satisfied if and only if the return expression in the following code would be well-formed, including any implicit conversions to the return type of the function:

```
To test() {
  return declval<From>();
}
```

[*Note 2*: This requirement gives well-defined results for reference types, void types, array types, and function types. — *end note*]

Access checking is performed in a context unrelated to To and From. Only the validity of the immediate context of the *expression* of the return statement (8.7.4) (including initialization of the returned object or reference) is considered.

[*Note 3*: The initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*]

20.15.8 Transformations between types [meta.trans]

20.15.8.1 General [meta.trans.general]

1 Subclause 20.15.8 contains templates that may be used to transform one type to another following some predefined rule.

2 Each of the templates in 20.15.8 shall be a *Cpp17TransformationTrait* (20.15.2).

20.15.8.2 Const-volatile modifications [meta.trans.cv]

Table 52: Const-volatile modifications [tab:meta.trans.cv]

Template	Comments
template<class T> struct remove_const;	The member typedef type names the same type as T except that any top-level const-qualifier has been removed. [*Example 1*: remove_const_t<const volatile int> evaluates to volatile int, whereas remove_const_t<const int*> evaluates to const int*. — *end example*]
template<class T> struct remove_volatile;	The member typedef type names the same type as T except that any top-level volatile-qualifier has been removed. [*Example 2*: remove_volatile_t<const volatile int> evaluates to const int, whereas remove_volatile_t<volatile int*> evaluates to volatile int*. — *end example*]
template<class T> struct remove_cv;	The member typedef type shall be the same as T except that any top-level cv-qualifier has been removed. [*Example 3*: remove_cv_t<const volatile int> evaluates to int, whereas remove_cv_t<const volatile int*> evaluates to const volatile int*. — *end example*]
template<class T> struct add_const;	If T is a reference, function, or top-level const-qualified type, then type names the same type as T, otherwise T const.
template<class T> struct add_volatile;	If T is a reference, function, or top-level volatile-qualified type, then type names the same type as T, otherwise T volatile.
template<class T> struct add_cv;	The member typedef type names the same type as add_const_t<add_volatile_t<T>>.

20.15.8.3 Reference modifications [meta.trans.ref]

Table 53: Reference modifications [tab:meta.trans.ref]

Template	Comments
template<class T> struct remove_reference;	If T has type "reference to T1" then the member typedef type names T1; otherwise, type names T.
template<class T> struct add_lvalue_reference;	If T names a referenceable type (3.45) then the member typedef type names T&; otherwise, type names T. [*Note 1*: This rule reflects the semantics of reference collapsing (9.3.4.3). — *end note*]
template<class T> struct add_rvalue_reference;	If T names a referenceable type then the member typedef type names T&&; otherwise, type names T. [*Note 2*: This rule reflects the semantics of reference collapsing (9.3.4.3). For example, when a type T names a type T1&, the type add_rvalue_reference_t<T> is not an rvalue reference. — *end note*]

20.15.8.4 Sign modifications [meta.trans.sign]

Table 54: Sign modifications [tab:meta.trans.sign]

Template	Comments
`template<class T>` `struct make_signed;`	If `T` names a (possibly cv-qualified) signed integer type (6.8.2) then the member typedef `type` names the type `T`; otherwise, if `T` names a (possibly cv-qualified) unsigned integer type then `type` names the corresponding signed integer type, with the same cv-qualifiers as `T`; otherwise, `type` names the signed integer type with smallest rank (6.8.5) for which `sizeof(T) == sizeof(type)`, with the same cv-qualifiers as `T`. *Mandates*: `T` is an integral or enumeration type other than *cv* `bool`.
`template<class T>` `struct make_unsigned;`	If `T` names a (possibly cv-qualified) unsigned integer type (6.8.2) then the member typedef `type` names the type `T`; otherwise, if `T` names a (possibly cv-qualified) signed integer type then `type` names the corresponding unsigned integer type, with the same cv-qualifiers as `T`; otherwise, `type` names the unsigned integer type with smallest rank (6.8.5) for which `sizeof(T) == sizeof(type)`, with the same cv-qualifiers as `T`. *Mandates*: `T` is an integral or enumeration type other than *cv* `bool`.

20.15.8.5 Array modifications [meta.trans.arr]

Table 55: Array modifications [tab:meta.trans.arr]

Template	Comments
`template<class T>` `struct remove_extent;`	If `T` names a type "array of `U`", the member typedef `type` shall be `U`, otherwise `T`. [*Note 1*: For multidimensional arrays, only the first array dimension is removed. For a type "array of `const U`", the resulting type is `const U`. — *end note*]
`template<class T>` `struct remove_all_extents;`	If `T` is "multi-dimensional array of `U`", the resulting member typedef `type` is `U`, otherwise `T`.

1 [*Example 1*:

```
// the following assertions hold:
assert((is_same_v<remove_extent_t<int>, int>));
assert((is_same_v<remove_extent_t<int[2]>, int>));
assert((is_same_v<remove_extent_t<int[2][3]>, int[3]>));
assert((is_same_v<remove_extent_t<int[][3]>, int[3]>));
```

— *end example*]

2 [*Example 2*:

```
// the following assertions hold:
assert((is_same_v<remove_all_extents_t<int>, int>));
assert((is_same_v<remove_all_extents_t<int[2]>, int>));
assert((is_same_v<remove_all_extents_t<int[2][3]>, int>));
assert((is_same_v<remove_all_extents_t<int[][3]>, int>));
```

— *end example*]

20.15.8.6 Pointer modifications [meta.trans.ptr]

Table 56: Pointer modifications [tab:meta.trans.ptr]

Template	Comments
`template<class T>` `struct remove_pointer;`	If `T` has type "(possibly cv-qualified) pointer to `T1`" then the member typedef `type` names `T1`; otherwise, it names `T`.
`template<class T>` `struct add_pointer;`	If `T` names a referenceable type (3.45) or a *cv* `void` type then the member typedef `type` names the same type as `remove_reference_t<T>*`; otherwise, `type` names `T`.

20.15.8.7 Other transformations [meta.trans.other]

Table 57: Other transformations [tab:meta.trans.other]

Template	Comments
`template<class T> struct type_identity;`	The member typedef `type` names the type `T`.
`template<size_t Len, size_t Align = `*`default-alignment`*`> struct aligned_storage;`	The value of *default-alignment* shall be the most stringent alignment requirement for any object type whose size is no greater than `Len` (6.8). The member typedef `type` shall be a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most `Len` and whose alignment is a divisor of `Align`. *Mandates*: `Len` is not zero. `Align` is equal to `alignof(T)` for some type `T` or to *default-alignment*.
`template<size_t Len, class... Types> struct aligned_union;`	The member typedef `type` shall be a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in `Types`; its size shall be at least `Len`. The static member `alignment_value` shall be an integral constant of type `size_t` whose value is the strictest alignment of all types listed in `Types`. *Mandates*: At least one type is provided. Each type in the template parameter pack `Types` is a complete object type.
`template<class T> struct remove_cvref;`	The member typedef `type` names the same type as `remove_cv_t<remove_reference_t<T>>`.
`template<class T> struct decay;`	Let `U` be `remove_reference_t<T>`. If `is_array_v<U>` is `true`, the member typedef `type` equals `remove_extent_t<U>*`. If `is_function_v<U>` is `true`, the member typedef `type` equals `add_pointer_t<U>`. Otherwise the member typedef `type` equals `remove_cv_t<U>`. [*Note 1*: This behavior is similar to the lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) conversions applied when an lvalue is used as an rvalue, but also strips cv-qualifiers from class types in order to more closely model by-value argument passing. — *end note*]
`template<bool B, class T = void> struct enable_if;`	If `B` is `true`, the member typedef `type` shall equal `T`; otherwise, there shall be no member `type`.
`template<bool B, class T, class F> struct conditional;`	If `B` is `true`, the member typedef `type` shall equal `T`. If `B` is `false`, the member typedef `type` shall equal `F`.
`template<class... T> struct common_type;`	Unless this trait is specialized (as specified in Note B, below), the member `type` is defined or omitted as specified in Note A, below. If it is omitted, there shall be no member `type`. Each type in the template parameter pack `T` shall be complete, *cv* `void`, or an array of unknown bound.
`template<class, class, template<class> class, template<class> class> struct basic_common_reference;`	Unless this trait is specialized (as specified in Note D, below), there shall be no member `type`.
`template<class... T> struct common_reference;`	The member *typedef-name* `type` is defined or omitted as specified in Note C, below. Each type in the parameter pack `T` shall be complete or *cv* `void`.
`template<class T> struct underlying_type;`	If `T` is an enumeration type, the member typedef `type` names the underlying type of `T` (9.7.1); otherwise, there is no member `type`. *Mandates*: `T` is not an incomplete enumeration type.

Table 57: Other transformations (continued)

Template	Comments
`template<class Fn, class... ArgTypes> struct invoke_result;`	If the expression *INVOKE*(`declval<Fn>(), declval<ArgTypes>()...`) is well-formed when treated as an unevaluated operand (7.2), the member typedef `type` names the type `decltype(`*INVOKE*`(declval<Fn>(), declval<ArgTypes>()...))`; otherwise, there shall be no member `type`. Access checking is performed as if in a context unrelated to `Fn` and `ArgTypes`. Only the validity of the immediate context of the expression is considered. [*Note 2*: The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the "immediate context" and can result in the program being ill-formed. — *end note*] *Preconditions*: `Fn` and all types in the template parameter pack `ArgTypes` are complete types, *cv* `void`, or arrays of unknown bound.
`template<class T> struct unwrap_reference;`	If `T` is a specialization `reference_wrapper<X>` for some type `X`, the member typedef `type` of `unwrap_reference<T>` is `X&`, otherwise it is `T`.
`template<class T> unwrap_ref_decay;`	The member typedef `type` of `unwrap_ref_decay<T>` denotes the type `unwrap_reference_t<decay_t<T>>`.

1 [*Note 3*: A typical implementation would define `aligned_storage` as:

```
template<size_t Len, size_t Alignment>
struct aligned_storage {
  typedef struct {
    alignas(Alignment) unsigned char __data[Len];
  } type;
};
```

— *end note*]

2 In addition to being available via inclusion of the `<type_traits>` header, the templates `unwrap_reference`, `unwrap_ref_decay`, `unwrap_reference_t`, and `unwrap_ref_decay_t` are available when the header `<functional>` (20.14.2) is included.

3 Let:

(3.1) — *CREF*(`A`) be `add_lvalue_reference_t<const remove_reference_t<A>>`,

(3.2) — *XREF*(`A`) denote a unary alias template `T` such that `T<U>` denotes the same type as `U` with the addition of `A`'s cv and reference qualifiers, for a non-reference cv-unqualified type `U`,

(3.3) — *COPYCV*(`FROM, TO`) be an alias for type `TO` with the addition of `FROM`'s top-level cv-qualifiers,

[*Example 1*: *COPYCV*(`const int, volatile short`) is an alias for `const volatile short`. — *end example*]

(3.4) — *COND-RES*(`X, Y`) be `decltype(false ? declval<X(&)()>()() : declval<Y(&)()>()())`.

Given types `A` and `B`, let `X` be `remove_reference_t<A>`, let `Y` be `remove_reference_t<B>`, and let *COMMON-REF*(`A, B`) be:

(3.5) — If `A` and `B` are both lvalue reference types, *COMMON-REF*(`A, B`) is *COND-RES*(*COPYCV*(`X, Y`) `&`, *COPYCV*(`Y, X`) `&`) if that type exists and is a reference type.

(3.6) — Otherwise, let `C` be `remove_reference_t<`*COMMON-REF*`(X&, Y&)>&&`. If `A` and `B` are both rvalue reference types, `C` is well-formed, and `is_convertible_v<A, C> && is_convertible_v<B, C>` is `true`, then *COMMON-REF*(`A, B`) is `C`.

(3.7) — Otherwise, let `D` be *COMMON-REF*(`const X&, Y&`). If `A` is an rvalue reference and `B` is an lvalue reference and `D` is well-formed and `is_convertible_v<A, D>` is `true`, then *COMMON-REF*(`A, B`) is `D`.

(3.8) — Otherwise, if `A` is an lvalue reference and `B` is an rvalue reference, then *COMMON-REF*(`A, B`) is *COMMON-REF*(`B, A`).

(3.9) — Otherwise, *COMMON-REF*(`A, B`) is ill-formed.

If any of the types computed above is ill-formed, then `COMMON-REF(A, B)` is ill-formed.

4 Note A: For the `common_type` trait applied to a template parameter pack `T` of types, the member `type` shall be either defined or not present as follows:

(4.1) — If `sizeof...(T)` is zero, there shall be no member `type`.

(4.2) — If `sizeof...(T)` is one, let `T0` denote the sole type constituting the pack `T`. The member *typedef-name* `type` shall denote the same type, if any, as `common_type_t<T0, T0>`; otherwise there shall be no member `type`.

(4.3) — If `sizeof...(T)` is two, let the first and second types constituting `T` be denoted by `T1` and `T2`, respectively, and let `D1` and `D2` denote the same types as `decay_t<T1>` and `decay_t<T2>`, respectively.

(4.3.1) — If `is_same_v<T1, D1>` is `false` or `is_same_v<T2, D2>` is `false`, let `C` denote the same type, if any, as `common_type_t<D1, D2>`.

(4.3.2) — [*Note 4*: None of the following will apply if there is a specialization `common_type<D1, D2>`. — *end note*]

(4.3.3) — Otherwise, if

```
decay_t<decltype(false ? declval<D1>() : declval<D2>())>
```

denotes a valid type, let `C` denote that type.

(4.3.4) — Otherwise, if `COND-RES(CREF(D1), CREF(D2))` denotes a type, let `C` denote the type `decay_t<COND-RES(CREF(D1), CREF(D2))>`.

In either case, the member *typedef-name* `type` shall denote the same type, if any, as `C`. Otherwise, there shall be no member `type`.

(4.4) — If `sizeof...(T)` is greater than two, let `T1`, `T2`, and `R`, respectively, denote the first, second, and (pack of) remaining types constituting `T`. Let `C` denote the same type, if any, as `common_type_t<T1, T2>`. If there is such a type `C`, the member *typedef-name* `type` shall denote the same type, if any, as `common_type_t<C, R...>`. Otherwise, there shall be no member `type`.

5 Note B: Notwithstanding the provisions of 20.15.3, and pursuant to 16.4.5.2.1, a program may specialize `common_type<T1, T2>` for types `T1` and `T2` such that `is_same_v<T1, decay_t<T1>>` and `is_same_v<T2, decay_t<T2>>` are each `true`.

[*Note 5*: Such specializations are needed when only explicit conversions are desired between the template arguments. — *end note*]

Such a specialization need not have a member named `type`, but if it does, that member shall be a *typedef-name* for an accessible and unambiguous cv-unqualified non-reference type `C` to which each of the types `T1` and `T2` is explicitly convertible. Moreover, `common_type_t<T1, T2>` shall denote the same type, if any, as does `common_type_t<T2, T1>`. No diagnostic is required for a violation of this Note's rules.

6 Note C: For the `common_reference` trait applied to a parameter pack `T` of types, the member `type` shall be either defined or not present as follows:

(6.1) — If `sizeof...(T)` is zero, there shall be no member `type`.

(6.2) — Otherwise, if `sizeof...(T)` is one, let `T0` denote the sole type in the pack `T`. The member typedef `type` shall denote the same type as `T0`.

(6.3) — Otherwise, if `sizeof...(T)` is two, let `T1` and `T2` denote the two types in the pack `T`. Then

(6.3.1) — If `T1` and `T2` are reference types and `COMMON-REF(T1, T2)` is well-formed, then the member typedef `type` denotes that type.

(6.3.2) — Otherwise, if `basic_common_reference<remove_cvref_t<T1>, remove_cvref_t<T2>, XREF(T1), XREF(T2)>::type` is well-formed, then the member typedef `type` denotes that type.

(6.3.3) — Otherwise, if `COND-RES(T1, T2)` is well-formed, then the member typedef `type` denotes that type.

(6.3.4) — Otherwise, if `common_type_t<T1, T2>` is well-formed, then the member typedef `type` denotes that type.

(6.3.5) — Otherwise, there shall be no member `type`.

(6.4) — Otherwise, if `sizeof...(T)` is greater than two, let `T1`, `T2`, and `Rest`, respectively, denote the first, second, and (pack of) remaining types comprising `T`. Let `C` be the type `common_reference_t<T1, T2>`. Then:

(6.4.1) — If there is such a type `C`, the member typedef `type` shall denote the same type, if any, as `common_reference_t<C, Rest...>`.

(6.4.2) — Otherwise, there shall be no member `type`.

7 Note D: Notwithstanding the provisions of 20.15.3, and pursuant to 16.4.5.2.1, a program may partially specialize `basic_common_reference<T, U, TQual, UQual>` for types `T` and `U` such that `is_same_v<T, decay_t<T>>` and `is_same_v<U, decay_t<U>>` are each `true`.

[*Note 6*: Such specializations can be used to influence the result of `common_reference`, and are needed when only explicit conversions are desired between the template arguments. — *end note*]

Such a specialization need not have a member named `type`, but if it does, that member shall be a *typedef-name* for an accessible and unambiguous type `C` to which each of the types `TQual<T>` and `UQual<U>` is convertible. Moreover, `basic_common_reference<T, U, TQual, UQual>::type` shall denote the same type, if any, as does `basic_common_reference<U, T, UQual, TQual>::type`. No diagnostic is required for a violation of these rules.

8 [*Example 2*: Given these definitions:

```
using PF1 = bool  (&)();
using PF2 = short (*)(long);

struct S {
  operator PF2() const;
  double operator()(char, int&);
  void fn(long) const;
  char data;
};

using PMF = void (S::*)(long) const;
using PMD = char  S::*;
```

the following assertions will hold:

```
static_assert(is_same_v<invoke_result_t<S, int>, short>);
static_assert(is_same_v<invoke_result_t<S&, unsigned char, int&>, double>);
static_assert(is_same_v<invoke_result_t<PF1>, bool>);
static_assert(is_same_v<invoke_result_t<PMF, unique_ptr<S>, int>, void>);
static_assert(is_same_v<invoke_result_t<PMD, S>, char&&>);
static_assert(is_same_v<invoke_result_t<PMD, const S*>, const char&>);
```

— *end example*]

20.15.9 Logical operator traits [meta.logical]

1 This subclause describes type traits for applying logical operators to other type traits.

```
template<class... B> struct conjunction : see below { };
```

2 The class template `conjunction` forms the logical conjunction of its template type arguments.

3 For a specialization `conjunction<B`$_1$`, ..., B`$_N$`>`, if there is a template type argument `B`$_i$ for which `bool(B`$_i$`::value)` is `false`, then instantiating `conjunction<B`$_1$`, ..., B`$_N$`>::value` does not require the instantiation of `B`$_j$`::value` for $j > i$.

[*Note 1*: This is analogous to the short-circuiting behavior of the built-in operator `&&`. — *end note*]

4 Every template type argument for which `B`$_i$`::value` is instantiated shall be usable as a base class and shall have a member `value` which is convertible to `bool`, is not hidden, and is unambiguously available in the type.

5 The specialization `conjunction<B`$_1$`, ..., B`$_N$`>` has a public and unambiguous base that is either

(5.1) — the first type `B`$_i$ in the list `true_type, B`$_1$`, ..., B`$_N$ for which `bool(B`$_i$`::value)` is `false`, or

(5.2) — if there is no such `B`$_i$, the last type in the list.

[*Note 2*: This means a specialization of `conjunction` does not necessarily inherit from either `true_type` or `false_type`. — *end note*]

6 The member names of the base class, other than `conjunction` and `operator=`, shall not be hidden and shall be unambiguously available in `conjunction`.

```
template<class... B> struct disjunction : see below { };
```

7 The class template `disjunction` forms the logical disjunction of its template type arguments.

8 For a specialization `disjunction<`B_1`, ..., `B_N`>`, if there is a template type argument B_i for which `bool(`B_i`::value)` is `true`, then instantiating `disjunction<`B_1`, ..., `B_N`>::value` does not require the instantiation of B_j`::value` for $j > i$.

[*Note 3*: This is analogous to the short-circuiting behavior of the built-in operator `||`. — *end note*]

9 Every template type argument for which B_i`::value` is instantiated shall be usable as a base class and shall have a member `value` which is convertible to `bool`, is not hidden, and is unambiguously available in the type.

10 The specialization `disjunction<`B_1`, ..., `B_N`>` has a public and unambiguous base that is either

(10.1) — the first type B_i in the list `false_type, `B_1`, ..., `B_N for which `bool(`B_i`::value)` is `true`, or

(10.2) — if there is no such B_i, the last type in the list.

[*Note 4*: This means a specialization of `disjunction` does not necessarily inherit from either `true_type` or `false_type`. — *end note*]

11 The member names of the base class, other than `disjunction` and `operator=`, shall not be hidden and shall be unambiguously available in `disjunction`.

```
template<class B> struct negation : see below { };
```

12 The class template `negation` forms the logical negation of its template type argument. The type `negation<B>` is a *Cpp17UnaryTypeTrait* with a base characteristic of `bool_constant<!bool(B::value)>`.

20.15.10 Member relationships [meta.member]

```
template<class S, class M>
  constexpr bool is_pointer_interconvertible_with_class(M S::*m) noexcept;
```

1 *Mandates*: `S` is a complete type.

2 *Returns*: `true` if and only if `S` is a standard-layout type, `M` is an object type, `m` is not null, and each object `s` of type `S` is pointer-interconvertible (6.8.3) with its subobject `s.*m`.

```
template<class S1, class S2, class M1, class M2>
  constexpr bool is_corresponding_member(M1 S1::*m1, M2 S2::*m2) noexcept;
```

3 *Mandates*: `S1` and `S2` are complete types.

4 *Returns*: `true` if and only if `S1` and `S2` are standard-layout types, `M1` and `M2` are object types, `m1` and `m2` are not null, and `m1` and `m2` point to corresponding members of the common initial sequence (11.4) of `S1` and `S2`.

5 [*Note 1*: The type of a pointer-to-member expression `&C::b` is not always a pointer to member of `C`, leading to potentially surprising results when using these functions in conjunction with inheritance.

[*Example 1*:

```
struct A { int a; };                    // a standard-layout class
struct B { int b; };                    // a standard-layout class
struct C: public A, public B { };       // not a standard-layout class

static_assert( is_pointer_interconvertible_with_class( &C::b ) );
  // Succeeds because, despite its appearance, &C::b has type
  // "pointer to member of B of type int".
static_assert( is_pointer_interconvertible_with_class<C>( &C::b ) );
  // Forces the use of class C, and fails.

static_assert( is_corresponding_member( &C::a, &C::b ) );
  // Succeeds because, despite its appearance, &C::a and &C::b have types
  // "pointer to member of A of type int" and
  // "pointer to member of B of type int", respectively.
static_assert( is_corresponding_member<C, C>( &C::a, &C::b ) );
  // Forces the use of class C, and fails.
```

— *end example*]

— *end note*]

20.15.11 Constant evaluation context [meta.const.eval]

```
constexpr bool is_constant_evaluated() noexcept;
```

1 *Returns*: `true` if and only if evaluation of the call occurs within the evaluation of an expression or conversion that is manifestly constant-evaluated (7.7).

2 [*Example 1*:

```
constexpr void f(unsigned char *p, int n) {
  if (std::is_constant_evaluated()) {           // should not be a constexpr if statement
    for (int k = 0; k<n; ++k) p[k] = 0;
  } else {
    memset(p, 0, n);                            // not a core constant expression
  }
}
```

— *end example*]

20.16 Compile-time rational arithmetic [ratio]

20.16.1 In general [ratio.general]

1 Subclause 20.16 describes the ratio library. It provides a class template `ratio` which exactly represents any finite rational number with a numerator and denominator representable by compile-time constants of type `intmax_t`.

2 Throughout subclause 20.16, the names of template parameters are used to express type requirements. If a template parameter is named `R1` or `R2`, and the template argument is not a specialization of the `ratio` template, the program is ill-formed.

20.16.2 Header <ratio> synopsis [ratio.syn]

```
namespace std {
  // 20.16.3, class template ratio
  template<intmax_t N, intmax_t D = 1> class ratio;

  // 20.16.4, ratio arithmetic
  template<class R1, class R2> using ratio_add = see below;
  template<class R1, class R2> using ratio_subtract = see below;
  template<class R1, class R2> using ratio_multiply = see below;
  template<class R1, class R2> using ratio_divide = see below;

  // 20.16.5, ratio comparison
  template<class R1, class R2> struct ratio_equal;
  template<class R1, class R2> struct ratio_not_equal;
  template<class R1, class R2> struct ratio_less;
  template<class R1, class R2> struct ratio_less_equal;
  template<class R1, class R2> struct ratio_greater;
  template<class R1, class R2> struct ratio_greater_equal;

  template<class R1, class R2>
    inline constexpr bool ratio_equal_v = ratio_equal<R1, R2>::value;
  template<class R1, class R2>
    inline constexpr bool ratio_not_equal_v = ratio_not_equal<R1, R2>::value;
  template<class R1, class R2>
    inline constexpr bool ratio_less_v = ratio_less<R1, R2>::value;
  template<class R1, class R2>
    inline constexpr bool ratio_less_equal_v = ratio_less_equal<R1, R2>::value;
  template<class R1, class R2>
    inline constexpr bool ratio_greater_v = ratio_greater<R1, R2>::value;
  template<class R1, class R2>
    inline constexpr bool ratio_greater_equal_v = ratio_greater_equal<R1, R2>::value;
```

```
  // 20.16.6, convenience SI typedefs
  using yocto = ratio<1, 1'000'000'000'000'000'000'000'000>;  // see below
  using zepto = ratio<1,     1'000'000'000'000'000'000'000>;  // see below
  using atto  = ratio<1,         1'000'000'000'000'000'000>;
  using femto = ratio<1,             1'000'000'000'000'000>;
  using pico  = ratio<1,                 1'000'000'000'000>;
  using nano  = ratio<1,                     1'000'000'000>;
  using micro = ratio<1,                         1'000'000>;
  using milli = ratio<1,                             1'000>;
  using centi = ratio<1,                               100>;
  using deci  = ratio<1,                                10>;
  using deca  = ratio<                              10, 1>;
  using hecto = ratio<                             100, 1>;
  using kilo  = ratio<                           1'000, 1>;
  using mega  = ratio<                       1'000'000, 1>;
  using giga  = ratio<                   1'000'000'000, 1>;
  using tera  = ratio<               1'000'000'000'000, 1>;
  using peta  = ratio<           1'000'000'000'000'000, 1>;
  using exa   = ratio<       1'000'000'000'000'000'000, 1>;
  using zetta = ratio<   1'000'000'000'000'000'000'000, 1>;  // see below
  using yotta = ratio<1'000'000'000'000'000'000'000'000, 1>;  // see below
}
```

20.16.3 Class template `ratio` [ratio.ratio]

```
namespace std {
  template<intmax_t N, intmax_t D = 1> class ratio {
  public:
    static constexpr intmax_t num;
    static constexpr intmax_t den;
    using type = ratio<num, den>;
  };
}
```

1 If the template argument `D` is zero or the absolute values of either of the template arguments `N` and `D` is not representable by type `intmax_t`, the program is ill-formed.

[*Note 1*: These rules ensure that infinite ratios are avoided and that for any negative input, there exists a representable value of its absolute value which is positive. This excludes the most negative value. — *end note*]

2 The static data members `num` and `den` shall have the following values, where `gcd` represents the greatest common divisor of the absolute values of `N` and `D`:

(2.1) — `num` shall have the value `sign(N) * sign(D) * abs(N) / gcd`.

(2.2) — `den` shall have the value `abs(D) / gcd`.

20.16.4 Arithmetic on ratios [ratio.arithmetic]

1 Each of the alias templates `ratio_add`, `ratio_subtract`, `ratio_multiply`, and `ratio_divide` denotes the result of an arithmetic computation on two `ratio`s `R1` and `R2`. With `X` and `Y` computed (in the absence of arithmetic overflow) as specified by Table 58, each alias denotes a `ratio<U, V>` such that `U` is the same as `ratio<X, Y>::num` and `V` is the same as `ratio<X, Y>::den`.

2 If it is not possible to represent `U` or `V` with `intmax_t`, the program is ill-formed. Otherwise, an implementation should yield correct values of `U` and `V`. If it is not possible to represent `X` or `Y` with `intmax_t`, the program is ill-formed unless the implementation yields correct values of `U` and `V`.

3 [*Example 1*:

```
static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>>::num == 1, "1/3+1/6 == 1/2");
static_assert(ratio_add<ratio<1, 3>, ratio<1, 6>>::den == 2, "1/3+1/6 == 1/2");
static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>>::num == 1, "1/3*3/2 == 1/2");
static_assert(ratio_multiply<ratio<1, 3>, ratio<3, 2>>::den == 2, "1/3*3/2 == 1/2");

// The following cases may cause the program to be ill-formed under some implementations
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>>::num == 2,
  "1/MAX+1/MAX == 2/MAX");
```

Table 58: Expressions used to perform ratio arithmetic [tab:ratio.arithmetic]

Type	Value of X	Value of Y
ratio_add<R1, R2>	R1::num * R2::den + R2::num * R1::den	R1::den * R2::den
ratio_subtract<R1, R2>	R1::num * R2::den - R2::num * R1::den	R1::den * R2::den
ratio_multiply<R1, R2>	R1::num * R2::num	R1::den * R2::den
ratio_divide<R1, R2>	R1::num * R2::den	R1::den * R2::num

```
static_assert(ratio_add<ratio<1, INT_MAX>, ratio<1, INT_MAX>>::den == INT_MAX,
  "1/MAX+1/MAX == 2/MAX");
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>>::num == 1,
  "1/MAX * MAX/2 == 1/2");
static_assert(ratio_multiply<ratio<1, INT_MAX>, ratio<INT_MAX, 2>>::den == 2,
  "1/MAX * MAX/2 == 1/2");
```

— *end example*]

20.16.5 Comparison of ratios [ratio.comparison]

```
template<class R1, class R2>
  struct ratio_equal : bool_constant<R1::num == R2::num && R1::den == R2::den> { };
```

```
template<class R1, class R2>
  struct ratio_not_equal : bool_constant<!ratio_equal_v<R1, R2>> { };
```

```
template<class R1, class R2>
  struct ratio_less : bool_constant<see below> { };
```

1 If `R1::num` × `R2::den` is less than `R2::num` × `R1::den`, `ratio_less<R1, R2>` shall be derived from `bool_constant<true>`; otherwise it shall be derived from `bool_constant<false>`. Implementations may use other algorithms to compute this relationship to avoid overflow. If overflow occurs, the program is ill-formed.

```
template<class R1, class R2>
  struct ratio_less_equal : bool_constant<!ratio_less_v<R2, R1>> { };
```

```
template<class R1, class R2>
  struct ratio_greater : bool_constant<ratio_less_v<R2, R1>> { };
```

```
template<class R1, class R2>
  struct ratio_greater_equal : bool_constant<!ratio_less_v<R1, R2>> { };
```

20.16.6 SI types for ratio [ratio.si]

1 For each of the *typedef-name*s `yocto`, `zepto`, `zetta`, and `yotta`, if both of the constants used in its specification are representable by `intmax_t`, the typedef is defined; if either of the constants is not representable by `intmax_t`, the typedef is not defined.

20.17 Class type_index [type.index]

20.17.1 Header <typeindex> synopsis [type.index.synopsis]

```
#include <compare>              // see 17.11.1

namespace std {
  class type_index;
  template<class T> struct hash;
  template<> struct hash<type_index>;
}
```

20.17.2 type_index overview [type.index.overview]

```
namespace std {
  class type_index {
  public:
    type_index(const type_info& rhs) noexcept;
    bool operator==(const type_index& rhs) const noexcept;
    bool operator< (const type_index& rhs) const noexcept;
    bool operator> (const type_index& rhs) const noexcept;
    bool operator<=(const type_index& rhs) const noexcept;
    bool operator>=(const type_index& rhs) const noexcept;
    strong_ordering operator<=>(const type_index& rhs) const noexcept;
    size_t hash_code() const noexcept;
    const char* name() const noexcept;

  private:
    const type_info* target;      // exposition only
    // Note that the use of a pointer here, rather than a reference,
    // means that the default copy/move constructor and assignment
    // operators will be provided and work as expected.
  };
}
```

1 The class `type_index` provides a simple wrapper for `type_info` which can be used as an index type in associative containers (22.4) and in unordered associative containers (22.5).

20.17.3 type_index members [type.index.members]

`type_index(const type_info& rhs) noexcept;`

1 *Effects*: Constructs a `type_index` object, the equivalent of `target = &rhs`.

`bool operator==(const type_index& rhs) const noexcept;`

2 *Returns*: `*target == *rhs.target`.

`bool operator<(const type_index& rhs) const noexcept;`

3 *Returns*: `target->before(*rhs.target)`.

`bool operator>(const type_index& rhs) const noexcept;`

4 *Returns*: `rhs.target->before(*target)`.

`bool operator<=(const type_index& rhs) const noexcept;`

5 *Returns*: `!rhs.target->before(*target)`.

`bool operator>=(const type_index& rhs) const noexcept;`

6 *Returns*: `!target->before(*rhs.target)`.

`strong_ordering operator<=>(const type_index& rhs) const noexcept;`

7 *Effects*: Equivalent to:

```
if (*target == *rhs.target) return strong_ordering::equal;
if (target->before(*rhs.target)) return strong_ordering::less;
return strong_ordering::greater;
```

`size_t hash_code() const noexcept;`

8 *Returns*: `target->hash_code()`.

`const char* name() const noexcept;`

9 *Returns*: `target->name()`.

20.17.4 Hash support [type.index.hash]

```
template<> struct hash<type_index>;
```

1 For an object `index` of type `type_index`, `hash<type_index>()(index)` shall evaluate to the same result as `index.hash_code()`.

20.18 Execution policies [execpol]

20.18.1 In general [execpol.general]

1 Subclause 20.18 describes classes that are *execution policy* types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions.

[*Example 1*:

```
using namespace std;
vector<int> v = /* ... */;

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(execution::seq, v.begin(), v.end());

// permitting parallel execution
sort(execution::par, v.begin(), v.end());

// permitting vectorization as well
sort(execution::par_unseq, v.begin(), v.end());
```

— *end example*]

[*Note 1*: Because different parallel architectures might require idiosyncratic parameters for efficient execution, implementations can provide additional execution policies to those described in this standard as extensions. — *end note*]

20.18.2 Header `<execution>` synopsis [execution.syn]

```
namespace std {
  // 20.18.3, execution policy type trait
  template<class T> struct is_execution_policy;
  template<class T> inline constexpr bool is_execution_policy_v = is_execution_policy<T>::value;
}

namespace std::execution {
  // 20.18.4, sequenced execution policy
  class sequenced_policy;

  // 20.18.5, parallel execution policy
  class parallel_policy;

  // 20.18.6, parallel and unsequenced execution policy
  class parallel_unsequenced_policy;

  // 20.18.7, unsequenced execution policy
  class unsequenced_policy;

  // 20.18.8, execution policy objects
  inline constexpr sequenced_policy            seq{ unspecified };
  inline constexpr parallel_policy             par{ unspecified };
  inline constexpr parallel_unsequenced_policy par_unseq{ unspecified };
  inline constexpr unsequenced_policy          unseq{ unspecified };
}
```

20.18.3 Execution policy type trait [execpol.type]

```
template<class T> struct is_execution_policy { see below };
```

1 `is_execution_policy` can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.

2 `is_execution_policy<T>` is a *Cpp17UnaryTypeTrait* with a base characteristic of `true_type` if `T` is the type of a standard or implementation-defined execution policy, otherwise `false_type`.

[*Note 1*: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — *end note*]

3 The behavior of a program that adds specializations for `is_execution_policy` is undefined.

20.18.4 Sequenced execution policy [execpol.seq]

```
class execution::sequenced_policy { unspecified };
```

1 The class `execution::sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm's execution may not be parallelized.

2 During the execution of a parallel algorithm with the `execution::sequenced_policy` policy, if the invocation of an element access function exits via an uncaught exception, `terminate()` is called.

20.18.5 Parallel execution policy [execpol.par]

```
class execution::parallel_policy { unspecified };
```

1 The class `execution::parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

2 During the execution of a parallel algorithm with the `execution::parallel_policy` policy, if the invocation of an element access function exits via an uncaught exception, `terminate()` is called.

20.18.6 Parallel and unsequenced execution policy [execpol.parunseq]

```
class execution::parallel_unsequenced_policy { unspecified };
```

1 The class `execution::parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

2 During the execution of a parallel algorithm with the `execution::parallel_unsequenced_policy` policy, if the invocation of an element access function exits via an uncaught exception, `terminate()` is called.

20.18.7 Unsequenced execution policy [execpol.unseq]

```
class execution::unsequenced_policy { unspecified };
```

1 The class `unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be vectorized, e.g., executed on a single thread using instructions that operate on multiple data items.

2 During the execution of a parallel algorithm with the `execution::unsequenced_policy` policy, if the invocation of an element access function exits via an uncaught exception, `terminate()` is called.

20.18.8 Execution policy objects [execpol.objects]

```
inline constexpr execution::sequenced_policy            execution::seq{ unspecified };
inline constexpr execution::parallel_policy             execution::par{ unspecified };
inline constexpr execution::parallel_unsequenced_policy execution::par_unseq{ unspecified };
inline constexpr execution::unsequenced_policy          execution::unseq{ unspecified };
```

1 The header `<execution>` declares global objects associated with each type of execution policy.

20.19 Primitive numeric conversions [charconv]

20.19.1 Header <charconv> synopsis [charconv.syn]

```
namespace std {
  // floating-point format for primitive numerical conversion
  enum class chars_format {
    scientific = unspecified,
    fixed = unspecified,
    hex = unspecified,
    general = fixed | scientific
  };

  // 20.19.2, primitive numerical output conversion
  struct to_chars_result {
    char* ptr;
    errc ec;
    friend bool operator==(const to_chars_result&, const to_chars_result&) = default;
  };

  to_chars_result to_chars(char* first, char* last, see below value, int base = 10);
  to_chars_result to_chars(char* first, char* last, bool value, int base = 10) = delete;

  to_chars_result to_chars(char* first, char* last, float value);
  to_chars_result to_chars(char* first, char* last, double value);
  to_chars_result to_chars(char* first, char* last, long double value);

  to_chars_result to_chars(char* first, char* last, float value, chars_format fmt);
  to_chars_result to_chars(char* first, char* last, double value, chars_format fmt);
  to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt);

  to_chars_result to_chars(char* first, char* last, float value,
                           chars_format fmt, int precision);
  to_chars_result to_chars(char* first, char* last, double value,
                           chars_format fmt, int precision);
  to_chars_result to_chars(char* first, char* last, long double value,
                           chars_format fmt, int precision);

  // 20.19.3, primitive numerical input conversion
  struct from_chars_result {
    const char* ptr;
    errc ec;
    friend bool operator==(const from_chars_result&, const from_chars_result&) = default;
  };

  from_chars_result from_chars(const char* first, const char* last,
                               see below& value, int base = 10);

  from_chars_result from_chars(const char* first, const char* last, float& value,
                               chars_format fmt = chars_format::general);
  from_chars_result from_chars(const char* first, const char* last, double& value,
                               chars_format fmt = chars_format::general);
  from_chars_result from_chars(const char* first, const char* last, long double& value,
                               chars_format fmt = chars_format::general);
}
```

1 The type `chars_format` is a bitmask type (16.3.3.3.4) with elements `scientific`, `fixed`, and `hex`.

2 The types `to_chars_result` and `from_chars_result` have the data members and special members specified above. They have no base classes or members other than those specified.

20.19.2 Primitive numeric output conversion [charconv.to.chars]

1 All functions named `to_chars` convert `value` into a character string by successively filling the range `[first, last)`, where `[first, last)` is required to be a valid range. If the member `ec` of the return value is such that the value is equal to the value of a value-initialized `errc`, the conversion was successful

and the member `ptr` is the one-past-the-end pointer of the characters written. Otherwise, the member `ec` has the value `errc::value_too_large`, the member `ptr` has the value `last`, and the contents of the range `[first, last)` are unspecified.

2 The functions that take a floating-point `value` but not a `precision` parameter ensure that the string representation consists of the smallest number of characters such that there is at least one digit before the radix point (if present) and parsing the representation using the corresponding `from_chars` function recovers `value` exactly.

[*Note 1*: This guarantee applies only if `to_chars` and `from_chars` are executed on the same implementation. — *end note*]

If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to `round_to_nearest` (17.3.4.1).

3 The functions taking a `chars_format` parameter determine the conversion specifier for `printf` as follows: The conversion specifier is `f` if `fmt` is `chars_format::fixed`, `e` if `fmt` is `chars_format::scientific`, `a` (without leading `"0x"` in the result) if `fmt` is `chars_format::hex`, and `g` if `fmt` is `chars_format::general`.

```
to_chars_result to_chars(char* first, char* last, see below value, int base = 10);
```

4 *Preconditions*: `base` has a value between 2 and 36 (inclusive).

5 *Effects*: The value of `value` is converted to a string of digits in the given base (with no redundant leading zeroes). Digits in the range 10..35 (inclusive) are represented as lowercase characters `a`..`z`. If `value` is less than zero, the representation starts with `'-'`.

6 *Throws*: Nothing.

7 *Remarks*: The implementation shall provide overloads for all signed and unsigned integer types and `char` as the type of the parameter `value`.

```
to_chars_result to_chars(char* first, char* last, float value);
to_chars_result to_chars(char* first, char* last, double value);
to_chars_result to_chars(char* first, char* last, long double value);
```

8 *Effects*: `value` is converted to a string in the style of `printf` in the `"C"` locale. The conversion specifier is `f` or `e`, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of `f`.

9 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, float value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, double value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt);
```

10 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

11 *Effects*: `value` is converted to a string in the style of `printf` in the `"C"` locale.

12 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, float value,
                         chars_format fmt, int precision);
to_chars_result to_chars(char* first, char* last, double value,
                         chars_format fmt, int precision);
to_chars_result to_chars(char* first, char* last, long double value,
                         chars_format fmt, int precision);
```

13 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

14 *Effects*: `value` is converted to a string in the style of `printf` in the `"C"` locale with the given precision.

15 *Throws*: Nothing.

SEE ALSO: ISO C 7.21.6.1

20.19.3 Primitive numeric input conversion [charconv.from.chars]

1 All functions named `from_chars` analyze the string `[first, last)` for a pattern, where `[first, last)` is required to be a valid range. If no characters match the pattern, `value` is unmodified, the member `ptr` of the return value is `first` and the member `ec` is equal to `errc::invalid_argument`.

[*Note 1*: If the pattern allows for an optional sign, but the string has no digit characters following the sign, no characters match the pattern. — *end note*]

Otherwise, the characters matching the pattern are interpreted as a representation of a value of the type of `value`. The member `ptr` of the return value points to the first character not matching the pattern, or has the value `last` if all characters match. If the parsed value is not in the range representable by the type of `value`, `value` is unmodified and the member `ec` of the return value is equal to `errc::result_out_of_range`. Otherwise, `value` is set to the parsed value, after rounding according to `round_to_nearest` (17.3.4.1), and the member `ec` is value-initialized.

```
from_chars_result from_chars(const char* first, const char* last,
                             see below& value, int base = 10);
```

2 *Preconditions*: `base` has a value between 2 and 36 (inclusive).

3 *Effects*: The pattern is the expected form of the subject sequence in the `"C"` locale for the given nonzero base, as described for `strtol`, except that no `"0x"` or `"0X"` prefix shall appear if the value of `base` is 16, and except that `'-'` is the only sign that may appear, and only if `value` has a signed type.

4 *Throws*: Nothing.

5 *Remarks*: The implementation shall provide overloads for all signed and unsigned integer types and `char` as the referenced type of the parameter `value`.

```
from_chars_result from_chars(const char* first, const char* last, float& value,
                             chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, double& value,
                             chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, long double& value,
                             chars_format fmt = chars_format::general);
```

6 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

7 *Effects*: The pattern is the expected form of the subject sequence in the `"C"` locale, as described for `strtod`, except that

(7.1) — the sign `'+'` may only appear in the exponent part;

(7.2) — if `fmt` has `chars_format::scientific` set but not `chars_format::fixed`, the otherwise optional exponent part shall appear;

(7.3) — if `fmt` has `chars_format::fixed` set but not `chars_format::scientific`, the optional exponent part shall not appear; and

(7.4) — if `fmt` is `chars_format::hex`, the prefix `"0x"` or `"0X"` is assumed.

[*Example 1*: The string `0x123` is parsed to have the value `0` with remaining characters `x123`. — *end example*]

In any case, the resulting `value` is one of at most two floating-point values closest to the value of the string matching the pattern.

8 *Throws*: Nothing.

1 The class template `format_to_n_result` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

20.20.2 Format string [format.string]

20.20.2.1 In general [format.string.general]

1 A *format string* for arguments `args` is a (possibly empty) sequence of *replacement fields*, *escape sequences*, and characters other than `{` and `}`. Let `charT` be the character type of the format string. Each character that is not part of a replacement field or an escape sequence is copied unchanged to the output. An escape sequence is one of `{{` or `}}`. It is replaced with `{` or `}`, respectively, in the output. The syntax of replacement fields is as follows:

replacement-field:
    `{` *arg-id*$_{opt}$ *format-specifier*$_{opt}$ `}`

arg-id:
    `0`
    positive-integer

positive-integer:
    nonzero-digit
    positive-integer digit

nonnegative-integer:
    digit
    nonnegative-integer digit

nonzero-digit: one of
    `1 2 3 4 5 6 7 8 9`

digit: one of
    `0 1 2 3 4 5 6 7 8 9`

format-specifier:
: *format-spec*

format-spec:
as specified by the `formatter` specialization for the argument type

2 The *arg-id* field specifies the index of the argument in `args` whose value is to be formatted and inserted into the output instead of the replacement field. If there is no argument with the index *arg-id* in `args`, the string is not a format string for `args`. The optional *format-specifier* field explicitly specifies a format for the replacement value.

3 [*Example 1*:

```
string s = format("{0}-{{", 8);          // value of s is "8-{"
```

— *end example*]

4 If all *arg-id*s in a format string are omitted (including those in the *format-spec*, as interpreted by the corresponding `formatter` specialization), argument indices 0, 1, 2, ... will automatically be used in that order. If some *arg-id*s are omitted and some are present, the string is not a format string.

[*Note 1*: A format string cannot contain a mixture of automatic and manual indexing. — *end note*]

[*Example 2*:

```
string s0 = format("{} to {}",   "a", "b"); // OK, automatic indexing
string s1 = format("{1} to {0}", "a", "b"); // OK, manual indexing
string s2 = format("{0} to {}",  "a", "b"); // not a format string (mixing automatic and manual indexing),
                                            // throws format_error
string s3 = format("{} to {1}",  "a", "b"); // not a format string (mixing automatic and manual indexing),
                                            // throws format_error
```

— *end example*]

5 The *format-spec* field contains *format specifications* that define how the value should be presented. Each type can define its own interpretation of the *format-spec* field. If *format-spec* does not conform to the format specifications for the argument type referred to by *arg-id*, the string is not a format string for `args`.

[*Example 3*:

(5.1) — For arithmetic, pointer, and string types the *format-spec* is interpreted as a *std-format-spec* as described in (20.20.2.2).

(5.2) — For chrono types the *format-spec* is interpreted as a *chrono-format-spec* as described in (27.12).

(5.3) — For user-defined `formatter` specializations, the behavior of the `parse` member function determines how the *format-spec* is interpreted.

— *end example*]

20.20.2.2 Standard format specifiers [format.string.std]

1 Each `formatter` specializations described in 20.20.5.2 for fundamental and string types interprets *format-spec* as a *std-format-spec*.

[*Note 1*: The format specification can be used to specify such details as field width, alignment, padding, and decimal precision. Some of the formatting options are only supported for arithmetic types. — *end note*]

The syntax of format specifications is as follows:

std-format-spec:
fill-and-align$_{opt}$ *sign*$_{opt}$ `#`$_{opt}$ `0`$_{opt}$ *width*$_{opt}$ *precision*$_{opt}$ `L`$_{opt}$ *type*$_{opt}$

fill-and-align:
fill$_{opt}$ *align*

fill:
any character other than `{` or `}`

align: one of
`<` `>` `^`

sign: one of
`+` `-` space

width:
positive-integer
`{` *arg-id*$_{opt}$ `}`

precision:
  . *nonnegative-integer*
  . { *arg-id*$_{opt}$ }

type: one of
  `a A b B c d e E f F g G o p s x X`

2 [*Note 2*: The *fill* character can be any character other than `{` or `}`. The presence of a fill character is signaled by the character following it, which must be one of the alignment options. If the second character of *std-format-spec* is not a valid alignment option, then it is assumed that both the fill character and the alignment option are absent. — *end note*]

3 The *align* specifier applies to all argument types. The meaning of the various alignment options is as specified in Table 59.

[*Example 1*:

```
char c = 120;
string s0 = format("{:6}", 42);         // value of s0 is "    42"
string s1 = format("{:6}", 'x');        // value of s1 is "x     "
string s2 = format("{:*<6}", 'x');      // value of s2 is "x*****"
string s3 = format("{:*>6}", 'x');      // value of s3 is "*****x"
string s4 = format("{:*^6}", 'x');      // value of s4 is "**x***"
string s5 = format("{:6d}", c);         // value of s5 is "   120"
string s6 = format("{:6}", true);       // value of s6 is "true  "
```

— *end example*]

[*Note 3*: Unless a minimum field width is defined, the field width is determined by the size of the content and the alignment option has no effect. — *end note*]

Table 59: Meaning of *align* options [tab:format.align]

Option	Meaning
`<`	Forces the field to be aligned to the start of the available space. This is the default for non-arithmetic types, `charT`, and `bool`, unless an integer presentation type is specified.
`>`	Forces the field to be aligned to the end of the available space. This is the default for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified.
`^`	Forces the field to be centered within the available space by inserting $\lfloor \frac{n}{2} \rfloor$ characters before and $\lceil \frac{n}{2} \rceil$ characters after the value, where n is the total number of fill characters to insert.

4 The *sign* option is only valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified. The meaning of the various options is as specified in Table 60.

Table 60: Meaning of *sign* options [tab:format.sign]

Option	Meaning
`+`	Indicates that a sign should be used for both non-negative and negative numbers. The `+` sign is inserted before the output of `to_chars` for non-negative numbers other than negative zero. [*Note 4*: For negative numbers and negative zero the output of `to_chars` will already contain the sign so no additional transformation is performed. — *end note*]
`-`	Indicates that a sign should be used for negative numbers and negative zero only (this is the default behavior).
space	Indicates that a leading space should be used for non-negative numbers other than negative zero, and a minus sign for negative numbers and negative zero.

5 The *sign* option applies to floating-point infinity and NaN.

[*Example 2*:

```
double inf = numeric_limits<double>::infinity();
double nan = numeric_limits<double>::quiet_NaN();
```

```
string s0 = format("{0:},{0:+},{0:-},{0: }", 1);       // value of s0 is "1,+1,1, 1"
string s1 = format("{0:},{0:+},{0:-},{0: }", -1);      // value of s1 is "-1,-1,-1,-1"
string s2 = format("{0:},{0:+},{0:-},{0: }", inf);     // value of s2 is "inf,+inf,inf, inf"
string s3 = format("{0:},{0:+},{0:-},{0: }", nan);     // value of s3 is "nan,+nan,nan, nan"
```

— end example]

6 The `#` option causes the *alternate form* to be used for the conversion. This option is valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified, and not otherwise. For integral types, the alternate form inserts the base prefix (if any) specified in Table 62 into the output after the sign character (possibly space) if there is one, or before the output of `to_chars` otherwise. For floating-point types, the alternate form causes the result of the conversion of finite values to always contain a decimal-point character, even if no digits follow it. Normally, a decimal-point character appears in the result of these conversions only if a digit follows it. In addition, for `g` and `G` conversions, trailing zeros are not removed from the result.

7 If `{` *arg-id*$_{opt}$ `}` is used in a *width* or *precision*, the value of the corresponding formatting argument is used in its place. If the corresponding formatting argument is not of integral type, or its value is negative for *precision* or non-positive for *width*, an exception of type `format_error` is thrown.

8 The *positive-integer* in *width* is a decimal integer defining the minimum field width. If *width* is not specified, there is no minimum field width, and the field width is determined based on the content of the field.

9 The *width* of a string is defined as the estimated number of column positions appropriate for displaying it in a terminal.

[*Note 5*: This is similar to the semantics of the POSIX `wcswidth` function. *— end note*]

10 For the purposes of width computation, a string is assumed to be in a locale-independent, implementation-defined encoding. Implementations should use a Unicode encoding on platforms capable of displaying Unicode text in a terminal.

[*Note 6*: This is the case for Windows[226]-based and many POSIX-based operating systems. *— end note*]

11 For a string in a Unicode encoding, implementations should estimate the width of a string as the sum of estimated widths of the first code points in its extended grapheme clusters. The extended grapheme clusters of a string are defined by UAX #29. The estimated width of the following code points is 2:

(11.1) — `U+1100-U+115F`

(11.2) — `U+2329-U+232A`

(11.3) — `U+2E80-U+303E`

(11.4) — `U+3040-U+A4CF`

(11.5) — `U+AC00-U+D7A3`

(11.6) — `U+F900-U+FAFF`

(11.7) — `U+FE10-U+FE19`

(11.8) — `U+FE30-U+FE6F`

(11.9) — `U+FF00-U+FF60`

(11.10) — `U+FFE0-U+FFE6`

(11.11) — `U+1F300-U+1F64F`

(11.12) — `U+1F900-U+1F9FF`

(11.13) — `U+20000-U+2FFFD`

(11.14) — `U+30000-U+3FFFD`

The estimated width of other code points is 1.

12 For a string in a non-Unicode encoding, the width of a string is unspecified.

13 A zero (`0`) character preceding the *width* field pads the field with leading zeros (following any indication of sign or base) to the field width, except when applied to an infinity or NaN. This option is only valid

226) Windows® is a registered trademark of Microsoft Corporation. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of this product.

for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified. If the `0` character and an *align* option both appear, the `0` character is ignored.

[*Example 3*:

```
char c = 120;
string s1 = format("{:+06d}", c);         // value of s1 is "+00120"
string s2 = format("{:#06x}", 0xa);       // value of s2 is "0x000a"
string s3 = format("{:<06}", -42);        // value of s3 is "-42   " (0 is ignored because of < alignment)
```

— *end example*]

14 The *nonnegative-integer* in *precision* is a decimal integer defining the precision or maximum field size. It can only be used with floating-point and string types. For floating-point types this field specifies the formatting precision. For string types, this field provides an upper bound for the estimated width of the prefix of the input string that is copied into the output. For a string in a Unicode encoding, the formatter copies to the output the longest prefix of whole extended grapheme clusters whose estimated width is no greater than the precision.

15 When the `L` option is used, the form used for the conversion is called the *locale-specific form*. The `L` option is only valid for arithmetic types, and its effect depends upon the type.

(15.1) — For integral types, the locale-specific form causes the context's locale to be used to insert the appropriate digit group separator characters.

(15.2) — For floating-point types, the locale-specific form causes the context's locale to be used to insert the appropriate digit group and radix separator characters.

(15.3) — For the textual representation of `bool`, the locale-specific form causes the context's locale to be used to insert the appropriate string as if obtained with `numpunct::truename` or `numpunct::falsename`.

16 The *type* determines how the data should be presented.

17 The available string presentation types are specified in Table 61.

Table 61: Meaning of *type* options for strings [tab:format.type.string]

Type	Meaning
none, `s`	Copies the string to the output.

18 The meaning of some non-string presentation types is defined in terms of a call to `to_chars`. In such cases, let `[first, last)` be a range large enough to hold the `to_chars` output and `value` be the formatting argument value. Formatting is done as if by calling `to_chars` as specified and copying the output through the output iterator of the format context.

[*Note 7*: Additional padding and adjustments are performed prior to copying the output through the output iterator as specified by the format specifiers. — *end note*]

19 The available integer presentation types for integral types other than `bool` and `charT` are specified in Table 62.

[*Example 4*:

```
string s0 = format("{}", 42);                           // value of s0 is "42"
string s1 = format("{0:b} {0:d} {0:o} {0:x}", 42);      // value of s1 is "101010 42 52 2a"
string s2 = format("{0:#x} {0:#X}", 42);                // value of s2 is "0x2a 0X2A"
string s3 = format("{:L}", 1234);                       // value of s3 might be "1,234"
                                                        // (depending on the locale)
```

— *end example*]

20 The available `charT` presentation types are specified in Table 63.

21 The available `bool` presentation types are specified in Table 64.

22 The available floating-point presentation types and their meanings for values other than infinity and NaN are specified in Table 65. For lower-case presentation types, infinity and NaN are formatted as `inf` and `nan`, respectively. For upper-case presentation types, infinity and NaN are formatted as `INF` and `NAN`, respectively.

[*Note 9*: In either case, a sign is included if indicated by the *sign* option. — *end note*]

23 The available pointer presentation types and their mapping to `to_chars` are specified in Table 66.

[*Note 10*: Pointer presentation types also apply to `nullptr_t`. — *end note*]

Table 62: Meaning of *type* options for integer types [tab:format.type.int]

Type	Meaning
`b`	`to_chars(first, last, value, 2)`; the base prefix is `0b`.
`B`	The same as `b`, except that the base prefix is `0B`.
`c`	Copies the character `static_cast<charT>(value)` to the output. Throws `format_error` if `value` is not in the range of representable values for `charT`.
`d`	`to_chars(first, last, value)`.
`o`	`to_chars(first, last, value, 8)`; the base prefix is `0` if `value` is nonzero and is empty otherwise.
`x`	`to_chars(first, last, value, 16)`; the base prefix is `0x`.
`X`	The same as `x`, except that it uses uppercase letters for digits above 9 and the base prefix is `0X`.
none	The same as `d`. [*Note 8*: If the formatting argument type is `charT` or `bool`, the default is instead `c` or `s`, respectively. — *end note*]

Table 63: Meaning of *type* options for `charT` [tab:format.type.char]

Type	Meaning
none, `c`	Copies the character to the output.
`b`, `B`, `d`, `o`, `x`, `X`	As specified in Table 62.

Table 64: Meaning of *type* options for `bool` [tab:format.type.bool]

Type	Meaning
none, `s`	Copies textual representation, either `true` or `false`, to the output.
`b`, `B`, `c`, `d`, `o`, `x`, `X`	As specified in Table 62 for the value `static_cast<unsigned char>(value)`.

Table 65: Meaning of *type* options for floating-point types [tab:format.type.float]

Type	Meaning

`a`	If *precision* is specified, equivalent to
	`to_chars(first, last, value, chars_format::hex, precision)`
	where `precision` is the specified formatting precision; equivalent to
	`to_chars(first, last, value, chars_format::hex)`
	otherwise.

`A`	The same as `a`, except that it uses uppercase letters for digits above 9 and `P` to indicate the exponent.
`e`	Equivalent to `to_chars(first, last, value, chars_format::scientific, precision)` where `precision` is the specified formatting precision, or `6` if *precision* is not specified.
`E`	The same as `e`, except that it uses `E` to indicate exponent.
`f`, `F`	Equivalent to `to_chars(first, last, value, chars_format::fixed, precision)` where `precision` is the specified formatting precision, or `6` if *precision* is not specified.
`g`	Equivalent to `to_chars(first, last, value, chars_format::general, precision)` where `precision` is the specified formatting precision, or `6` if *precision* is not specified.
`G`	The same as `g`, except that it uses `E` to indicate exponent.

none	If *precision* is specified, equivalent to
	`to_chars(first, last, value, chars_format::general, precision)`
	where `precision` is the specified formatting precision; equivalent to
	`to_chars(first, last, value)`
	otherwise.

Table 66: Meaning of *type* options for pointer types [tab:format.type.ptr]

Type	Meaning
none, `p`	If `uintptr_t` is defined, `to_chars(first, last, reinterpret_cast<uintptr_t>(value), 16)` with the prefix `0x` added to the output; otherwise, implementation-defined.

20.20.3 Error reporting [format.err.report]

1 Formatting functions throw `format_error` if an argument `fmt` is passed that is not a format string for `args`. They propagate exceptions thrown by operations of `formatter` specializations and iterators. Failure to allocate storage is reported by throwing an exception as described in 16.4.6.13.

20.20.4 Formatting functions [format.functions]

1 In the description of the functions, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as in 25.2.

```
template<class... Args>
  string format(string_view fmt, const Args&... args);
```

2 *Effects*: Equivalent to:

```
return vformat(fmt, make_format_args(args...));
```

```
template<class... Args>
  wstring format(wstring_view fmt, const Args&... args);
```

3 *Effects*: Equivalent to:

```
return vformat(fmt, make_wformat_args(args...));
```

```
template<class... Args>
  string format(const locale& loc, string_view fmt, const Args&... args);
```

4 *Effects*: Equivalent to:

```
return vformat(loc, fmt, make_format_args(args...));
```

```
template<class... Args>
  wstring format(const locale& loc, wstring_view fmt, const Args&... args);
```

5 *Effects*: Equivalent to:

```
return vformat(loc, fmt, make_wformat_args(args...));
```

```
string vformat(string_view fmt, format_args args);
wstring vformat(wstring_view fmt, wformat_args args);
string vformat(const locale& loc, string_view fmt, format_args args);
wstring vformat(const locale& loc, wstring_view fmt, wformat_args args);
```

6 *Returns*: A string object holding the character representation of formatting arguments provided by `args` formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.

7 *Throws*: As specified in 20.20.3.

```
template<class Out, class... Args>
  Out format_to(Out out, string_view fmt, const Args&... args);
template<class Out, class... Args>
  Out format_to(Out out, wstring_view fmt, const Args&... args);
```

8 *Effects*: Equivalent to:

```
using context = basic_format_context<Out, decltype(fmt)::value_type>;
return vformat_to(out, fmt, make_format_args<context>(args...));
```

```
template<class Out, class... Args>
  Out format_to(Out out, const locale& loc, string_view fmt, const Args&... args);
template<class Out, class... Args>
  Out format_to(Out out, const locale& loc, wstring_view fmt, const Args&... args);
```

9 *Effects*: Equivalent to:

```
    using context = basic_format_context<Out, decltype(fmt)::value_type>;
    return vformat_to(out, loc, fmt, make_format_args<context>(args...));
```

```
template<class Out>
  Out vformat_to(Out out, string_view fmt,
                 format_args_t<type_identity_t<Out>, char> args);
template<class Out>
  Out vformat_to(Out out, wstring_view fmt,
                 format_args_t<type_identity_t<Out>, wchar_t> args);
template<class Out>
  Out vformat_to(Out out, const locale& loc, string_view fmt,
                 format_args_t<type_identity_t<Out>, char> args);
template<class Out>
  Out vformat_to(Out out, const locale& loc, wstring_view fmt,
                 format_args_t<type_identity_t<Out>, wchar_t> args);
```

10 Let charT be decltype(fmt)::value_type.

11 *Constraints*: Out satisfies output_iterator<const charT&>.

12 *Preconditions*: Out models output_iterator<const charT&>.

13 *Effects*: Places the character representation of formatting the arguments provided by args, formatted according to the specifications given in fmt, into the range [out, out + N), where N is formatted_size(fmt, args...) for the functions without a loc parameter and formatted_size(loc, fmt, args...) for the functions with a loc parameter. If present, loc is used for locale-specific formatting.

14 *Returns*: out + N.

15 *Throws*: As specified in 20.20.3.

```
template<class Out, class... Args>
  format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                      string_view fmt, const Args&... args);
template<class Out, class... Args>
  format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                      wstring_view fmt, const Args&... args);
template<class Out, class... Args>
  format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                      const locale& loc, string_view fmt,
                                      const Args&... args);
template<class Out, class... Args>
  format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                      const locale& loc, wstring_view fmt,
                                      const Args&... args);
```

16 Let

(16.1) — charT be decltype(fmt)::value_type,

(16.2) — N be formatted_size(fmt, args...) for the functions without a loc parameter and formatted_size(loc, fmt, args...) for the functions with a loc parameter, and

(16.3) — M be clamp(n, 0, N).

17 *Constraints*: Out satisfies output_iterator<const charT&>.

18 *Preconditions*: Out models output_iterator<const charT&>, and formatter<T_i, charT> meets the *Formatter* requirements (20.20.5.1) for each T_i in Args.

19 *Effects*: Places the first M characters of the character representation of formatting the arguments provided by args, formatted according to the specifications given in fmt, into the range [out, out + M). If present, loc is used for locale-specific formatting.

20 *Returns*: {out + M, N}.

21 *Throws*: As specified in 20.20.3.

```
template<class... Args>
  size_t formatted_size(string_view fmt, const Args&... args);
template<class... Args>
  size_t formatted_size(wstring_view fmt, const Args&... args);
```

```
template<class... Args>
  size_t formatted_size(const locale& loc, string_view fmt, const Args&... args);
template<class... Args>
  size_t formatted_size(const locale& loc, wstring_view fmt, const Args&... args);
```

22 Let `charT` be `decltype(fmt)::value_type`.

23 *Preconditions*: `formatter<`$\texttt{T}_i$`, charT>` meets the *Formatter* requirements (20.20.5.1) for each $\texttt{T}_i$ in `Args`.

24 *Returns*: The number of characters in the character representation of formatting arguments `args` formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.

25 *Throws*: As specified in 20.20.3.

20.20.5 Formatter [format.formatter]

20.20.5.1 Formatter requirements [formatter.requirements]

1 A type `F` meets the *Formatter* requirements if:

(1.1) — it meets the

(1.1.1) — *Cpp17DefaultConstructible* (Table 27),

(1.1.2) — *Cpp17CopyConstructible* (Table 29),

(1.1.3) — *Cpp17CopyAssignable* (Table 31), and

(1.1.4) — *Cpp17Destructible* (Table 32)

requirements,

(1.2) — it is swappable (16.4.4.3) for lvalues, and

(1.3) — the expressions shown in Table 67 are valid and have the indicated semantics.

2 Given character type `charT`, output iterator type `Out`, and formatting argument type `T`, in Table 67:

(2.1) — `f` is a value of type `F`,

(2.2) — `u` is an lvalue of type `T`,

(2.3) — `t` is a value of a type convertible to (possibly const) `T`,

(2.4) — `PC` is `basic_format_parse_context<charT>`,

(2.5) — `FC` is `basic_format_context<Out, charT>`,

(2.6) — `pc` is an lvalue of type `PC`, and

(2.7) — `fc` is an lvalue of type `FC`.

`pc.begin()` points to the beginning of the *format-spec* (20.20.2) of the replacement field being formatted in the format string. If *format-spec* is empty then either `pc.begin() == pc.end()` or `*pc.begin() == '}'`.

20.20.5.2 Formatter specializations [format.formatter.spec]

1 The functions defined in 20.20.4 use specializations of the class template `formatter` to format individual arguments.

2 Let `charT` be either `char` or `wchar_t`. Each specialization of `formatter` is either enabled or disabled, as described below.

[*Note 1*: Enabled specializations meet the *Formatter* requirements, and disabled specializations do not. — *end note*]

Each header that declares the template `formatter` provides the following enabled specializations:

(2.1) — The specializations

```
template<> struct formatter<char, char>;
template<> struct formatter<char, wchar_t>;
template<> struct formatter<wchar_t, wchar_t>;
```

(2.2) — For each `charT`, the string type specializations

```
template<> struct formatter<charT*, charT>;
template<> struct formatter<const charT*, charT>;
template<size_t N> struct formatter<const charT[N], charT>;
```

Table 67: *Formatter* requirements [tab:formatter]

Expression	Return type	Requirement
`f.parse(pc)`	`PC::iterator`	Parses *format-spec* (20.20.2) for type `T` in the range `[pc.begin(), pc.end())` until the first unmatched character. Throws `format_error` unless the whole range is parsed or the unmatched character is `}`. [*Note 1*: This allows formatters to emit meaningful error messages. — *end note*] Stores the parsed format specifiers in `*this` and returns an iterator past the end of the parsed range.
`f.format(t, fc)`	`FC::iterator`	Formats `t` according to the specifiers stored in `*this`, writes the output to `fc.out()` and returns an iterator past the end of the output range. The output shall only depend on `t`, `fc.locale()`, and the range `[pc.begin(), pc.end())` from the last call to `f.parse(pc)`.
`f.format(u, fc)`	`FC::iterator`	As above, but does not modify `u`.

```
template<class traits, class Allocator>
  struct formatter<basic_string<charT, traits, Allocator>, charT>;
template<class traits>
  struct formatter<basic_string_view<charT, traits>, charT>;
```

(2.3) — For each `charT`, for each cv-unqualified arithmetic type `ArithmeticT` other than `char`, `wchar_t`, `char8_t`, `char16_t`, or `char32_t`, a specialization

```
template<> struct formatter<ArithmeticT, charT>;
```

(2.4) — For each `charT`, the pointer type specializations

```
template<> struct formatter<nullptr_t, charT>;
template<> struct formatter<void*, charT>;
template<> struct formatter<const void*, charT>;
```

The `parse` member functions of these formatters interpret the format specification as a *std-format-spec* as described in 20.20.2.2.

[*Note 2*: Specializations such as `formatter<wchar_t, char>` and `formatter<const char*, wchar_t>` that would require implicit multibyte / wide string or character conversion are disabled. — *end note*]

3 For any types `T` and `charT` for which neither the library nor the user provides an explicit or partial specialization of the class template `formatter`, `formatter<T, charT>` is disabled.

4 If the library provides an explicit or partial specialization of `formatter<T, charT>`, that specialization is enabled except as noted otherwise.

5 If `F` is a disabled specialization of `formatter`, these values are `false`:

(5.1) — `is_default_constructible_v<F>`,

(5.2) — `is_copy_constructible_v<F>`,

(5.3) — `is_move_constructible_v<F>`,

(5.4) — `is_copy_assignable_v<F>`, and

(5.5) — `is_move_assignable_v<F>`.

6 An enabled specialization `formatter<T, charT>` meets the *Formatter* requirements (20.20.5.1).

[*Example 1*:

```
#include <format>

enum color { red, green, blue };
const char* color_names[] = { "red", "green", "blue" };
```

```
template<> struct std::formatter<color> : std::formatter<const char*> {
  auto format(color c, format_context& ctx) {
    return formatter<const char*>::format(color_names[c], ctx);
  }
};

struct err {};

std::string s0 = std::format("{}", 42);          // OK, library-provided formatter
std::string s1 = std::format("{}", L"foo");      // error: disabled formatter
std::string s2 = std::format("{}", red);         // OK, user-provided formatter
std::string s3 = std::format("{}", err{});       // error: disabled formatter
```

— end example]

20.20.5.3 Class template `basic_format_parse_context` [format.parse.ctx]

```
namespace std {
  template<class charT>
  class basic_format_parse_context {
  public:
    using char_type = charT;
    using const_iterator = typename basic_string_view<charT>::const_iterator;
    using iterator = const_iterator;

  private:
    iterator begin_;                                    // exposition only
    iterator end_;                                      // exposition only
    enum indexing { unknown, manual, automatic };       // exposition only
    indexing indexing_;                                 // exposition only
    size_t next_arg_id_;                                // exposition only
    size_t num_args_;                                   // exposition only

  public:
    constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
                                                  size_t num_args = 0) noexcept;
    basic_format_parse_context(const basic_format_parse_context&) = delete;
    basic_format_parse_context& operator=(const basic_format_parse_context&) = delete;

    constexpr const_iterator begin() const noexcept;
    constexpr const_iterator end() const noexcept;
    constexpr void advance_to(const_iterator it);

    constexpr size_t next_arg_id();
    constexpr void check_arg_id(size_t id);
  };
}
```

1 An instance of `basic_format_parse_context` holds the format string parsing state consisting of the format string range being parsed and the argument counter for automatic indexing.

```
constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
                                              size_t num_args = 0) noexcept;
```

2 *Effects*: Initializes `begin_` with `fmt.begin()`, `end_` with `fmt.end()`, `indexing_` with `unknown`, `next_arg_id_` with `0`, and `num_args_` with `num_args`.

```
constexpr const_iterator begin() const noexcept;
```

3 *Returns*: `begin_`.

```
constexpr const_iterator end() const noexcept;
```

4 *Returns*: `end_`.

```
constexpr void advance_to(const_iterator it);
```

5 *Preconditions*: `end()` is reachable from `it`.

6 *Effects*: Equivalent to: `begin_ = it;`

```
constexpr size_t next_arg_id();
```

7 *Effects*: If `indexing_ != manual`, equivalent to:

```
if (indexing_ == unknown)
  indexing_ = automatic;
return next_arg_id_++;
```

8 *Throws*: `format_error` if `indexing_ == manual` which indicates mixing of automatic and manual argument indexing.

```
constexpr void check_arg_id(size_t id);
```

9 *Effects*: If `indexing_ != automatic`, equivalent to:

```
if (indexing_ == unknown)
  indexing_ = manual;
```

10 *Throws*: `format_error` if `indexing_ == automatic` which indicates mixing of automatic and manual argument indexing.

11 *Remarks*: Call expressions where `id >= num_args_` are not core constant expressions (7.7).

20.20.5.4 Class template `basic_format_context` [format.context]

```
namespace std {
  template<class Out, class charT>
  class basic_format_context {
    basic_format_args<basic_format_context> args_;      // exposition only
    Out out_;                                           // exposition only

  public:
    using iterator = Out;
    using char_type = charT;
    template<class T> using formatter_type = formatter<T, charT>;

    basic_format_arg<basic_format_context> arg(size_t id) const;
    std::locale locale();

    iterator out();
    void advance_to(iterator it);
  };
}
```

1 An instance of `basic_format_context` holds formatting state consisting of the formatting arguments and the output iterator.

2 `Out` shall model `output_iterator<const charT&>`.

3 `format_context` is an alias for a specialization of `basic_format_context` with an output iterator that appends to `string`, such as `back_insert_iterator<string>`. Similarly, `wformat_context` is an alias for a specialization of `basic_format_context` with an output iterator that appends to `wstring`.

4 [*Note 1*: For a given type `charT`, implementations are encouraged to provide a single instantiation of `basic_format_context` for appending to `basic_string<charT>`, `vector<charT>`, or any other container with contiguous storage by wrapping those in temporary objects with a uniform interface (such as a `span<charT>`) and polymorphic reallocation. — *end note*]

```
basic_format_arg<basic_format_context> arg(size_t id) const;
```

5 *Returns*: `args_.get(id)`.

```
std::locale locale();
```

6 *Returns*: The locale passed to the formatting function if the latter takes one, and `std::locale()` otherwise.

```
iterator out();
```

7 *Returns*: `out_`.

```
void advance_to(iterator it);
```

8 *Effects*: Equivalent to: `out_ = it;`

[*Example 1*:

```
struct S { int value; };

template<> struct std::formatter<S> {
  size_t width_arg_id = 0;

  // Parses a width argument id in the format { digit }.
  constexpr auto parse(format_parse_context& ctx) {
    auto iter = ctx.begin();
    auto get_char = [&]() { return iter != ctx.end() ? *iter : 0; };
    if (get_char() != '{')
      return iter;
    ++iter;
    char c = get_char();
    if (!isdigit(c) || (++iter, get_char()) != '}')
      throw format_error("invalid format");
    width_arg_id = c - '0';
    ctx.check_arg_id(width_arg_id);
    return ++iter;
  }

  // Formats an S with width given by the argument width_arg_id.
  auto format(S s, format_context& ctx) {
    int width = visit_format_arg([](auto value) -> int {
      if constexpr (!is_integral_v<decltype(value)>)
        throw format_error("width is not integral");
      else if (value < 0 || value > numeric_limits<int>::max())
        throw format_error("invalid width");
      else
        return value;
      }, ctx.arg(width_arg_id));
    return format_to(ctx.out(), "{0:x<{1}}", s.value, width);
  }
};

std::string s = std::format("{0:{1}}", S{42}, 10);  // value of s is "xxxxxxxx42"
```

— *end example*]

20.20.6 Arguments [format.arguments]

20.20.6.1 Class template basic_format_arg [format.arg]

```
namespace std {
  template<class Context>
  class basic_format_arg {
  public:
    class handle;

  private:
    using char_type = typename Context::char_type;                    // exposition only

    variant<monostate, bool, char_type,
            int, unsigned int, long long int, unsigned long long int,
            float, double, long double,
            const char_type*, basic_string_view<char_type>,
            const void*, handle> value;                                  // exposition only

    template<class T> explicit basic_format_arg(const T& v) noexcept;   // exposition only
    explicit basic_format_arg(float n) noexcept;                        // exposition only
    explicit basic_format_arg(double n) noexcept;                       // exposition only
    explicit basic_format_arg(long double n) noexcept;                  // exposition only
    explicit basic_format_arg(const char_type* s);                      // exposition only
```

```
    template<class traits>
      explicit basic_format_arg(
        basic_string_view<char_type, traits> s) noexcept;                   // exposition only

    template<class traits, class Allocator>
      explicit basic_format_arg(
        const basic_string<char_type, traits, Allocator>& s) noexcept;      // exposition only

    explicit basic_format_arg(nullptr_t) noexcept;                          // exposition only

    template<class T>
      explicit basic_format_arg(const T* p) noexcept;                       // exposition only

  public:
    basic_format_arg() noexcept;

    explicit operator bool() const noexcept;
  };
}
```

1 An instance of `basic_format_arg` provides access to a formatting argument for user-defined formatters.

2 The behavior of a program that adds specializations of `basic_format_arg` is undefined.

```
basic_format_arg() noexcept;
```

3 *Postconditions*: `!(*this)`.

```
template<class T> explicit basic_format_arg(const T& v) noexcept;
```

4 *Constraints*: The template specialization

```
typename Context::template formatter_type<T>
```

meets the *Formatter* requirements (20.20.5.1). The extent to which an implementation determines that the specialization meets the *Formatter* requirements is unspecified, except that as a minimum the expression

```
typename Context::template formatter_type<T>()
  .format(declval<const T&>(), declval<Context&>())
```

shall be well-formed when treated as an unevaluated operand.

5 *Effects*:

(5.1) — if `T` is `bool` or `char_type`, initializes `value` with `v`;

(5.2) — otherwise, if `T` is `char` and `char_type` is `wchar_t`, initializes `value` with `static_cast<wchar_t>(v)`;

(5.3) — otherwise, if `T` is a signed integer type (6.8.2) and `sizeof(T) <= sizeof(int)`, initializes `value` with `static_cast<int>(v)`;

(5.4) — otherwise, if `T` is an unsigned integer type and `sizeof(T) <= sizeof(unsigned int)`, initializes `value` with `static_cast<unsigned int>(v)`;

(5.5) — otherwise, if `T` is a signed integer type and `sizeof(T) <= sizeof(long long int)`, initializes `value` with `static_cast<long long int>(v)`;

(5.6) — otherwise, if `T` is an unsigned integer type and `sizeof(T) <= sizeof(unsigned long long int)`, initializes `value` with `static_cast<unsigned long long int>(v)`;

(5.7) — otherwise, initializes `value` with `handle(v)`.

```
explicit basic_format_arg(float n) noexcept;
explicit basic_format_arg(double n) noexcept;
explicit basic_format_arg(long double n) noexcept;
```

6 *Effects*: Initializes `value` with `n`.

```
explicit basic_format_arg(const char_type* s);
```

7 *Preconditions*: `s` points to a NTCTS (3.36).

8 *Effects*: Initializes `value` with `s`.

```
template<class traits>
  explicit basic_format_arg(basic_string_view<char_type, traits> s) noexcept;
```

9 *Effects*: Initializes `value` with `s`.

```
template<class traits, class Allocator>
  explicit basic_format_arg(
    const basic_string<char_type, traits, Allocator>& s) noexcept;
```

10 *Effects*: Initializes `value` with `basic_string_view<char_type>(s.data(), s.size())`.

```
explicit basic_format_arg(nullptr_t) noexcept;
```

11 *Effects*: Initializes `value` with `static_cast<const void*>(nullptr)`.

```
template<class T> explicit basic_format_arg(const T* p) noexcept;
```

12 *Constraints*: `is_void_v<T>` is `true`.

13 *Effects*: Initializes `value` with `p`.

14 [*Note 1*: Constructing `basic_format_arg` from a pointer to a member is ill-formed unless the user provides an enabled specialization of `formatter` for that pointer to member type. — *end note*]

```
explicit operator bool() const noexcept;
```

15 *Returns*: `!holds_alternative<monostate>(value)`.

16 The class `handle` allows formatting an object of a user-defined type.

```
namespace std {
  template<class Context>
  class basic_format_arg<Context>::handle {
    const void* ptr_;                                          // exposition only
    void (*format_)(basic_format_parse_context<char_type>&,
                    Context&, const void*);                    // exposition only

    template<class T> explicit handle(const T& val) noexcept;  // exposition only

    friend class basic_format_arg<Context>;                    // exposition only

  public:
    void format(basic_format_parse_context<char_type>&, Context& ctx) const;
  };
}
```

```
template<class T> explicit handle(const T& val) noexcept;
```

17 *Effects*: Initializes `ptr_` with `addressof(val)` and `format_` with

```
[](basic_format_parse_context<char_type>& parse_ctx,
   Context& format_ctx, const void* ptr) {
  typename Context::template formatter_type<T> f;
  parse_ctx.advance_to(f.parse(parse_ctx));
  format_ctx.advance_to(f.format(*static_cast<const T*>(ptr), format_ctx));
}
```

```
void format(basic_format_parse_context<char_type>& parse_ctx, Context& format_ctx) const;
```

18 *Effects*: Equivalent to: `format_(parse_ctx, format_ctx, ptr_);`

```
template<class Visitor, class Context>
  see below visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
```

19 *Effects*: Equivalent to: `return visit(forward<Visitor>(vis), arg.value);`

20.20.6.2 Class template *format-arg-store* [format.arg.store]

```
namespace std {
  template<class Context, class... Args>
  struct format-arg-store {       // exposition only
```

```
    array<basic_format_arg<Context>, sizeof...(Args)> args;
  };
}
```

1 An instance of *format-arg-store* stores formatting arguments.

```
template<class Context = format_context, class... Args>
  format-arg-store<Context, Args...> make_format_args(const Args&... args);
```

2 *Preconditions*: The type `typename Context::template formatter_type<T`$_i$`>` meets the *Formatter* requirements (20.20.5.1) for each `T`$_i$ in `Args`.

3 *Returns*: `{basic_format_arg<Context>(args)...}`.

```
template<class... Args>
  format-arg-store<wformat_context, Args...> make_wformat_args(const Args&... args);
```

4 *Effects*: Equivalent to: `return make_format_args<wformat_context>(args...);`

20.20.6.3 Class template `basic_format_args` [format.args]

```
namespace std {
  template<class Context>
  class basic_format_args {
    size_t size_;                                // exposition only
    const basic_format_arg<Context>* data_;      // exposition only

  public:
    basic_format_args() noexcept;

    template<class... Args>
      basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;

    basic_format_arg<Context> get(size_t i) const noexcept;
  };
}
```

1 An instance of `basic_format_args` provides access to formatting arguments.

```
basic_format_args() noexcept;
```

2 *Effects*: Initializes `size_` with `0`.

```
template<class... Args>
  basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;
```

3 *Effects*: Initializes `size_` with `sizeof...(Args)` and `data_` with `store.args.data()`.

```
basic_format_arg<Context> get(size_t i) const noexcept;
```

4 *Returns*: `i < size_ ? data_[i] : basic_format_arg<Context>()`.

5 [*Note 1*: Implementations are encouraged to optimize the representation of `basic_format_args` for small number of formatting arguments by storing indices of type alternatives separately from values and packing the former. — *end note*]

20.20.7 Class `format_error` [format.error]

```
namespace std {
  class format_error : public runtime_error {
  public:
    explicit format_error(const string& what_arg);
    explicit format_error(const char* what_arg);
  };
}
```

1 The class `format_error` defines the type of objects thrown as exceptions to report errors from the formatting library.

```
format_error(const string& what_arg);
```

2 *Postconditions*: `strcmp(what(), what_arg.c_str()) == 0`.

`format_error(const char* what_arg);`

3 *Postconditions*: `strcmp(what(), what_arg) == 0`.

21 Strings library [strings]

21.1 General [strings.general]

1 This Clause describes components for manipulating sequences of any non-array trivial standard-layout (6.8) type. Such types are called *char-like types*, and objects of char-like types are called *char-like objects* or simply *characters*.

2 The following subclauses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in Table 68.

Table 68: Strings library summary [tab:strings.summary]

	Subclause	Header
21.2	Character traits	`<string>`
21.3	String classes	
21.4	String view classes	`<string_view>`
21.5	Null-terminated sequence utilities	`<cctype>`, `<cstdlib>`, `<cstring>`, `<cuchar>`, `<cwchar>`, `<cwctype>`

21.2 Character traits [char.traits]

21.2.1 General [char.traits.general]

1 Subclause 21.2 defines requirements on classes representing *character traits*, and defines a class template `char_traits<charT>`, along with five specializations, `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`, that meet those requirements.

2 Most classes specified in 21.3, 21.4, and Clause 29 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member *typedef-name*s and functions in the template parameter `traits` used by each such template. Subclause 21.2 defines the semantics of these members.

3 To specialize those templates to generate a string, string view, or iostream class to handle a particular character container type (3.10) `C`, that and its related character traits class `X` are passed as a pair of parameters to the string, string view, or iostream template as parameters `charT` and `traits`. If `X::char_type` is not the same type as `C`, the program is ill-formed.

21.2.2 Character traits requirements [char.traits.require]

1 In Table 69, `X` denotes a traits class defining types and functions for the character container type `C`; `c` and `d` denote values of type `C`; `p` and `q` denote values of type `const C*`; `s` denotes a value of type `C*`; `n`, `i` and `j` denote values of type `size_t`; `e` and `f` denote values of type `X::int_type`; `pos` denotes a value of type `X::pos_type`; and `r` denotes an lvalue of type `C`. Operations on `X` shall not throw exceptions.

Table 69: Character traits requirements [tab:char.traits.req]

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::char_type`	`C`		compile-time
`X::int_type`		(described in 21.2.3)	compile-time
`X::off_type`		(described in 29.2.2 and 29.3)	compile-time
`X::pos_type`		(described in 29.2.2 and 29.3)	compile-time
`X::state_type`		(described in 21.2.3)	compile-time
`X::eq(c,d)`	`bool`	*Returns*: whether `c` is to be treated as equal to `d`.	constant
`X::lt(c,d)`	`bool`	*Returns*: whether `c` is to be treated as less than `d`.	constant

Table 69: Character traits requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::compare(p,q,n)`	`int`	*Returns*: `0` if for each `i` in `[0,n)`, `X::eq(p[i],q[i])` is `true`; else, a negative value if, for some `j` in `[0,n)`, `X::lt(p[j],q[j])` is `true` and for each `i` in `[0,j)` `X::eq(p[i],q[i])` is `true`; else a positive value.	linear
`X::length(p)`	`size_t`	*Returns*: the smallest `i` such that `X::eq(p[i],charT())` is `true`.	linear
`X::find(p,n,c)`	`const X::char_type*`	*Returns*: the smallest `q` in `[p,p+n)` such that `X::eq(*q,c)` is `true`, zero otherwise.	linear
`X::move(s,p,n)`	`X::char_type*`	for each `i` in `[0,n)`, performs `X::assign(s[i],p[i])`. Copies correctly even where the ranges `[p,p+n)` and `[s,s+n)` overlap. *Returns*: `s`.	linear
`X::copy(s,p,n)`	`X::char_type*`	*Preconditions*: `p` not in `[s,s+n)`. *Returns*: `s`. for each `i` in `[0,n)`, performs `X::assign(s[i],p[i])`.	linear
`X::assign(r,d)`	(not used)	assigns `r=d`.	constant
`X::assign(s,n,c)`	`X::char_type*`	for each `i` in `[0,n)`, performs `X::assign(s[i],c)`. *Returns*: `s`.	linear
`X::not_eof(e)`	`int_type`	*Returns*: `e` if `X::eq_int_type(e,X::eof())` is `false`, otherwise a value `f` such that `X::eq_int_type(f,X::eof())` is `false`.	constant
`X::to_char_type(e)`	`X::char_type`	*Returns*: if for some `c`, `X::eq_int_type(e,X::to_int_type(c))` is `true`, `c`; else some unspecified value.	constant
`X::to_int_type(c)`	`X::int_type`	*Returns*: some value `e`, constrained by the definitions of `to_char_type` and `eq_int_type`.	constant
`X::eq_int_type(e,f)`	`bool`	*Returns*: for all `c` and `d`, `X::eq(c,d)` is equal to `X::eq_int_type(X::to_int_type(c), X::to_int_type(d))`; otherwise, yields `true` if `e` and `f` are both copies of `X::eof()`; otherwise, yields `false` if one of `e` and `f` is a copy of `X::eof()` and the other is not; otherwise the value is unspecified.	constant

Table 69: Character traits requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::eof()`	`X::int_type`	*Returns*: a value `e` such that `X::eq_int_type(e,X::to_int_type(c))` is `false` for all values `c`.	constant

2 The class template

```
template<class charT> struct char_traits;
```

is provided in the header `<string>` as a basis for explicit specializations.

21.2.3 Traits typedefs [char.traits.typedefs]

```
using int_type = see below;
```

1 *Preconditions*: `int_type` shall be able to represent all of the valid characters converted from the corresponding `char_type` values, as well as an end-of-file value, `eof()`.[227]

```
using state_type = see below;
```

2 *Preconditions*: `state_type` meets the *Cpp17Destructible* (Table 32), *Cpp17CopyAssignable* (Table 31), *Cpp17CopyConstructible* (Table 29), and *Cpp17DefaultConstructible* (Table 27) requirements.

21.2.4 `char_traits` specializations [char.traits.specializations]

21.2.4.1 General [char.traits.specializations.general]

```
namespace std {
  template<> struct char_traits<char>;
  template<> struct char_traits<char8_t>;
  template<> struct char_traits<char16_t>;
  template<> struct char_traits<char32_t>;
  template<> struct char_traits<wchar_t>;
}
```

1 The header `<string>` defines five specializations of the class template `char_traits`: `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`.

21.2.4.2 `struct char_traits<char>` [char.traits.specializations.char]

```
namespace std {
  template<> struct char_traits<char> {
    using char_type  = char;
    using int_type   = int;
    using off_type   = streamoff;
    using pos_type   = streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);
```

227) If `eof()` can be held in `char_type` then some iostreams operations can give surprising results.

```
    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

1 The type `mbstate_t` is defined in `<cwchar>` and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.

2 The two-argument member `assign` is defined identically to the built-in operator `=`. The two-argument members `eq` and `lt` are defined identically to the built-in operators `==` and `<` for type `unsigned char`.

3 The member `eof()` returns `EOF`.

21.2.4.3 struct char_traits<char8_t> [char.traits.specializations.char8.t]

```
namespace std {
  template<> struct char_traits<char8_t> {
    using char_type  = char8_t;
    using int_type   = unsigned int;
    using off_type   = streamoff;
    using pos_type   = u8streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<` respectively.

2 The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

21.2.4.4 struct char_traits<char16_t> [char.traits.specializations.char16.t]

```
namespace std {
  template<> struct char_traits<char16_t> {
    using char_type  = char16_t;
    using int_type   = uint_least16_t;
    using off_type   = streamoff;
    using pos_type   = u16streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;
```

```
    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

2 The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

21.2.4.5 `struct char_traits<char32_t>` [char.traits.specializations.char32.t]

```
namespace std {
  template<> struct char_traits<char32_t> {
    using char_type  = char32_t;
    using int_type   = uint_least32_t;
    using off_type   = streamoff;
    using pos_type   = u32streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

2 The member `eof()` returns an implementation-defined constant that cannot appear as a Unicode code point.

21.2.4.6 `struct char_traits<wchar_t>` [char.traits.specializations.wchar.t]

```
namespace std {
  template<> struct char_traits<wchar_t> {
    using char_type  = wchar_t;
    using int_type   = wint_t;
    using off_type   = streamoff;
    using pos_type   = wstreampos;
    using state_type = mbstate_t;
```

```
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;

  };
}
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

2 The member `eof()` returns `WEOF`.

21.3 String classes [string.classes]

21.3.1 General [string.classes.general]

1 The header `<string>` defines the `basic_string` class template for manipulating varying-length sequences of char-like objects and five *typedef-name*s, `string`, `u8string`, `u16string`, `u32string`, and `wstring`, that name the specializations `basic_string<char>`, `basic_string<char8_t>`, `basic_string<char16_t>`, `basic_string<char32_t>`, and `basic_string<wchar_t>`, respectively.

21.3.2 Header `<string>` synopsis [string.syn]

```
#include <compare>              // see 17.11.1
#include <initializer_list>     // see 17.10.2

namespace std {
  // 21.2, character traits

21.3.3 Class template basic_string [basic.string]

21.3.3.1 General [basic.string.general]

1 The class template `basic_string` describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a "string" if the type of the char-like objects that it holds is clear from context. In the rest of 21.3.3, the type of the char-like objects held in a `basic_string` object is designated by `charT`.

2 A specialization of `basic_string` is a contiguous container (22.2.1).

3 In all cases, `[data(), data() + size()]` is a valid range, `data() + size()` points at an object with value `charT()` (a "null terminator"), and `size() <= capacity()` is `true`.

```
namespace std {
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
  class basic_string {
  public:
```

```

constexpr int compare(size_type pos1, size_type n1, const basic_string& str,
                      size_type pos2, size_type n2 = npos) const;
constexpr int compare(const charT* s) const;
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;

constexpr bool starts_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool starts_with(charT x) const noexcept;
constexpr bool starts_with(const charT* x) const;
constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;
```

```
    constexpr bool ends_with(charT x) const noexcept;
    constexpr bool ends_with(const charT* x) const;
  };

  template<class InputIterator,
           class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
    basic_string(InputIterator, InputIterator, Allocator = Allocator())
      -> basic_string<typename iterator_traits<InputIterator>::value_type,
                      char_traits<typename iterator_traits<InputIterator>::value_type>,
                      Allocator>;

  template<class charT,
           class traits,
           class Allocator = allocator<charT>>
    explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
      -> basic_string<charT, traits, Allocator>;

  template<class charT,
           class traits,
           class Allocator = allocator<charT>>
    basic_string(basic_string_view<charT, traits>,
                 typename see below::size_type, typename see below::size_type,
                 const Allocator& = Allocator())
      -> basic_string<charT, traits, Allocator>;
}
```

4 A size_type parameter type in a basic_string deduction guide refers to the size_type member type of the type deduced by the deduction guide.

21.3.3.2 General requirements [string.require]

1 If any operation would cause size() to exceed max_size(), that operation throws an exception object of type length_error.

2 If any member function or operator of basic_string throws an exception, that function or operator has no other effect on the basic_string object.

3 In every specialization basic_string<charT, traits, Allocator>, the type allocator_traits<Allocator>::value_type shall name the same type as charT. Every object of type basic_string<charT, traits, Allocator> uses an object of type Allocator to allocate and free storage for the contained charT objects as needed. The Allocator object used is obtained as described in 22.2.1. In every specialization basic_string<charT, traits, Allocator>, the type traits shall meet the character traits requirements (21.2).

[*Note 1*: The program is ill-formed if traits::char_type is not the same type as charT. — *end note*]

4 References, pointers, and iterators referring to the elements of a basic_string sequence may be invalidated by the following uses of that basic_string object:

(4.1) — Passing as an argument to any standard library function taking a reference to non-const basic_string as an argument.[228]

(4.2) — Calling non-const member functions, except operator[], at, data, front, back, begin, rbegin, end, and rend.

21.3.3.3 Constructors and assignment operators [string.cons]

```
constexpr explicit basic_string(const Allocator& a) noexcept;
```

1 *Postconditions*: size() is equal to 0.

```
constexpr basic_string(const basic_string& str);
constexpr basic_string(basic_string&& str) noexcept;
```

2 *Effects*: Constructs an object whose value is that of str prior to this call.

3 *Remarks*: In the second form, str is left in a valid but unspecified state.

228) For example, as an argument to non-member functions swap() (21.3.4.3), operator>>() (21.3.4.4), and getline() (21.3.4.4), or as an argument to basic_string::swap().

```
constexpr basic_string(const basic_string& str, size_type pos,
                       const Allocator& a = Allocator());
constexpr basic_string(const basic_string& str, size_type pos, size_type n,
                       const Allocator& a = Allocator());
```

4 *Effects*: Let `n` be `npos` for the first overload. Equivalent to:

```
basic_string(basic_string_view<charT, traits>(str).substr(pos, n), a)
```

```
template<class T>
  constexpr basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());
```

5 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

6 *Effects*: Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t;` and then behaves the same as:

```
basic_string(sv.substr(pos, n), a);
```

```
template<class T>
  constexpr explicit basic_string(const T& t, const Allocator& a = Allocator());
```

7 *Constraints*:

(7.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(7.2) — `is_convertible_v<const T&, const charT*>` is `false`.

8 *Effects*: Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t;` and then behaves the same as `basic_string(sv.data(), sv.size(), a)`.

```
constexpr basic_string(const charT* s, size_type n, const Allocator& a = Allocator());
```

9 *Preconditions*: `[s, s + n)` is a valid range.

10 *Effects*: Constructs an object whose initial value is the range `[s, s + n)`.

11 *Postconditions*: `size()` is equal to `n`, and `traits::compare(data(), s, n)` is equal to `0`.

```
constexpr basic_string(const charT* s, const Allocator& a = Allocator());
```

12 *Constraints*: `Allocator` is a type that qualifies as an allocator (22.2.1).

[*Note 1*: This affects class template argument deduction. — *end note*]

13 *Effects*: Equivalent to: `basic_string(s, traits::length(s), a)`.

```
constexpr basic_string(size_type n, charT c, const Allocator& a = Allocator());
```

14 *Constraints*: `Allocator` is a type that qualifies as an allocator (22.2.1).

[*Note 2*: This affects class template argument deduction. — *end note*]

15 *Effects*: Constructs an object whose value consists of `n` copies of `c`.

```
template<class InputIterator>
  constexpr basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());
```

16 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (22.2.1).

17 *Effects*: Constructs a string from the values in the range `[begin, end)`, as indicated in Table 77.

```
constexpr basic_string(initializer_list<charT> il, const Allocator& a = Allocator());
```

18 *Effects*: Equivalent to `basic_string(il.begin(), il.end(), a)`.

```
constexpr basic_string(const basic_string& str, const Allocator& alloc);
constexpr basic_string(basic_string&& str, const Allocator& alloc);
```

19 *Effects*: Constructs an object whose value is that of `str` prior to this call. The stored allocator is constructed from `alloc`. In the second form, `str` is left in a valid but unspecified state.

20 *Throws*: The second form throws nothing if `alloc == str.get_allocator()`.

```
template<class InputIterator,
         class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
  basic_string(InputIterator, InputIterator, Allocator = Allocator())
    -> basic_string<typename iterator_traits<InputIterator>::value_type,
```

```
                    char_traits<typename iterator_traits<InputIterator>::value_type>,
                    Allocator>;
```

21 *Constraints*: `InputIterator` is a type that qualifies as an input iterator, and `Allocator` is a type that qualifies as an allocator (22.2.1).

```
template<class charT,
         class traits,
         class Allocator = allocator<charT>>
  explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
    -> basic_string<charT, traits, Allocator>;

template<class charT,
         class traits,
         class Allocator = allocator<charT>>
  basic_string(basic_string_view<charT, traits>,
               typename see below::size_type, typename see below::size_type,
               const Allocator& = Allocator())
    -> basic_string<charT, traits, Allocator>;
```

22 *Constraints*: `Allocator` is a type that qualifies as an allocator (22.2.1).

```
constexpr basic_string& operator=(const basic_string& str);
```

23 *Effects*: If `*this` and `str` are the same object, has no effect. Otherwise, replaces the value of `*this` with a copy of `str`.

24 *Returns*: `*this`.

```
constexpr basic_string& operator=(basic_string&& str)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

25 *Effects*: Move assigns as a sequence container (22.2), except that iterators, pointers and references may be invalidated.

26 *Returns*: `*this`.

```
template<class T>
  constexpr basic_string& operator=(const T& t);
```

27 *Constraints*:

(27.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(27.2) — `is_convertible_v<const T&, const charT*>` is `false`.

28 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv);
```

```
constexpr basic_string& operator=(const charT* s);
```

29 *Effects*: Equivalent to: `return *this = basic_string_view<charT, traits>(s);`

```
constexpr basic_string& operator=(charT c);
```

30 *Effects*: Equivalent to:

```
return *this = basic_string_view<charT, traits>(addressof(c), 1);
```

```
constexpr basic_string& operator=(initializer_list<charT> il);
```

31 *Effects*: Equivalent to:

```
return *this = basic_string_view<charT, traits>(il.begin(), il.size());
```

21.3.3.4 Iterator support [string.iterators]

```
constexpr iterator       begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;
```

1 *Returns*: An iterator referring to the first character in the string.

```
constexpr iterator       end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;
```

2 *Returns*: An iterator which is the past-the-end value.

```
constexpr reverse_iterator       rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
```

3 *Returns*: An iterator which is semantically equivalent to `reverse_iterator(end())`.

```
constexpr reverse_iterator       rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;
```

4 *Returns*: An iterator which is semantically equivalent to `reverse_iterator(begin())`.

21.3.3.5 Capacity [string.capacity]

```
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
```

1 *Returns*: A count of the number of char-like objects currently in the string.

2 *Complexity*: Constant time.

```
constexpr size_type max_size() const noexcept;
```

3 *Returns*: The largest possible number of char-like objects that can be stored in a `basic_string`.

4 *Complexity*: Constant time.

```
constexpr void resize(size_type n, charT c);
```

5 *Effects*: Alters the value of `*this` as follows:

(5.1) — If `n <= size()`, erases the last `size() - n` elements.

(5.2) — If `n > size()`, appends `n - size()` copies of `c`.

```
constexpr void resize(size_type n);
```

6 *Effects*: Equivalent to `resize(n, charT())`.

```
constexpr size_type capacity() const noexcept;
```

7 *Returns*: The size of the allocated storage in the string.

8 *Complexity*: Constant time.

```
constexpr void reserve(size_type res_arg);
```

9 *Effects*: A directive that informs a `basic_string` of a planned change in size, so that the storage allocation can be managed accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`.

10 *Throws*: `length_error` if `res_arg > max_size()` or any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr void shrink_to_fit();
```

11 *Effects*: `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[*Note 1*: The request is non-binding to allow latitude for implementation-specific optimizations. — *end note*]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation.

12 *Complexity*: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

13 *Remarks*: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[*Note 2*: If no reallocation happens, they remain valid. — *end note*]

```
constexpr void clear() noexcept;
```

14 *Effects*: Equivalent to: `erase(begin(), end());`

```
[[nodiscard]] constexpr bool empty() const noexcept;
```

15 *Effects*: Equivalent to: `return size() == 0;`

21.3.3.6 Element access [string.access]

```
constexpr const_reference operator[](size_type pos) const;
constexpr reference       operator[](size_type pos);
```

1 *Preconditions*: `pos <= size()`.

2 *Returns*: `*(begin() + pos)` if `pos < size()`. Otherwise, returns a reference to an object of type `charT` with value `charT()`, where modifying the object to any value other than `charT()` leads to undefined behavior.

3 *Throws*: Nothing.

4 *Complexity*: Constant time.

```
constexpr const_reference at(size_type pos) const;
constexpr reference       at(size_type pos);
```

5 *Returns*: `operator[](pos)`.

6 *Throws*: `out_of_range` if `pos >= size()`.

```
constexpr const charT& front() const;
constexpr charT& front();
```

7 *Preconditions*: `!empty()`.

8 *Effects*: Equivalent to: `return operator[](0);`

```
constexpr const charT& back() const;
constexpr charT& back();
```

9 *Preconditions*: `!empty()`.

10 *Effects*: Equivalent to: `return operator[](size() - 1);`

21.3.3.7 Modifiers [string.modifiers]

21.3.3.7.1 `basic_string::operator+=` [string.op.append]

```
constexpr basic_string& operator+=(const basic_string& str);
```

1 *Effects*: Equivalent to: `return append(str);`

```
template<class T>
  constexpr basic_string& operator+=(const T& t);
```

2 *Constraints*:

(2.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(2.2) — `is_convertible_v<const T&, const charT*>` is `false`.

3 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv);
```

```
constexpr basic_string& operator+=(const charT* s);
```

4 *Effects*: Equivalent to: `return append(s);`

```
constexpr basic_string& operator+=(charT c);
```

5 *Effects*: Equivalent to: `return append(size_type{1}, c);`

```
constexpr basic_string& operator+=(initializer_list<charT> il);
```

6 *Effects*: Equivalent to: `return append(il);`

21.3.3.7.2 `basic_string::append` [string.append]

```
constexpr basic_string& append(const basic_string& str);
```

1 *Effects*: Equivalent to: `return append(str.data(), str.size());`

```
constexpr basic_string& append(const basic_string& str, size_type pos, size_type n = npos);
```

2 *Effects*: Equivalent to:

```
return append(basic_string_view<charT, traits>(str).substr(pos, n));
```

```
template<class T>
  constexpr basic_string& append(const T& t);
```

3 *Constraints*:

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(3.2) — `is_convertible_v<const T&, const charT*>` is `false`.

4 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& append(const T& t, size_type pos, size_type n = npos);
```

5 *Constraints*:

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(5.2) — `is_convertible_v<const T&, const charT*>` is `false`.

6 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv.substr(pos, n));
```

```
constexpr basic_string& append(const charT* s, size_type n);
```

7 *Preconditions*: `[s, s + n)` is a valid range.

8 *Effects*: Appends a copy of the range `[s, s + n)` to the string.

9 *Returns*: `*this`.

```
constexpr basic_string& append(const charT* s);
```

10 *Effects*: Equivalent to: `return append(s, traits::length(s));`

```
constexpr basic_string& append(size_type n, charT c);
```

11 *Effects*: Appends `n` copies of `c` to the string.

12 *Returns*: `*this`.

```
template<class InputIterator>
  constexpr basic_string& append(InputIterator first, InputIterator last);
```

13 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (22.2.1).

14 *Effects*: Equivalent to: `return append(basic_string(first, last, get_allocator()));`

```
constexpr basic_string& append(initializer_list<charT> il);
```

15 *Effects*: Equivalent to: `return append(il.begin(), il.size());`

```
constexpr void push_back(charT c);
```

16 *Effects*: Equivalent to `append(size_type{1}, c)`.

21.3.3.7.3 `basic_string::assign` [string.assign]

```
constexpr basic_string& assign(const basic_string& str);
```

1 *Effects*: Equivalent to: `return *this = str;`

```
constexpr basic_string& assign(basic_string&& str)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

2 *Effects*: Equivalent to: `return *this = std::move(str);`

```
constexpr basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);
```

3 *Effects*: Equivalent to:

```
return assign(basic_string_view<charT, traits>(str).substr(pos, n));
```

```
template<class T>
  constexpr basic_string& assign(const T& t);
```

4 *Constraints*:

(4.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(4.2) — `is_convertible_v<const T&, const charT*>` is `false`.

5 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& assign(const T& t, size_type pos, size_type n = npos);
```

6 *Constraints*:

(6.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(6.2) — `is_convertible_v<const T&, const charT*>` is `false`.

7 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv.substr(pos, n));
```

```
constexpr basic_string& assign(const charT* s, size_type n);
```

8 *Preconditions*: `[s, s + n)` is a valid range.

9 *Effects*: Replaces the string controlled by `*this` with a copy of the range `[s, s + n)`.

10 *Returns*: `*this`.

```
constexpr basic_string& assign(const charT* s);
```

11 *Effects*: Equivalent to: `return assign(s, traits::length(s));`

```
constexpr basic_string& assign(initializer_list<charT> il);
```

12 *Effects*: Equivalent to: `return assign(il.begin(), il.size());`

```
constexpr basic_string& assign(size_type n, charT c);
```

13 *Effects*: Equivalent to:

```
clear();
resize(n, c);
return *this;
```

```
template<class InputIterator>
  constexpr basic_string& assign(InputIterator first, InputIterator last);
```

14 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (22.2.1).

15 *Effects*: Equivalent to: `return assign(basic_string(first, last, get_allocator()));`

21.3.3.7.4 basic_string::insert [string.insert]

```
constexpr basic_string& insert(size_type pos, const basic_string& str);
```

1 *Effects*: Equivalent to: `return insert(pos, str.data(), str.size());`

```
constexpr basic_string& insert(size_type pos1, const basic_string& str,
                               size_type pos2, size_type n = npos);
```

2 *Effects*: Equivalent to:

```
return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);
```

```
template<class T>
  constexpr basic_string& insert(size_type pos, const T& t);
```

3 *Constraints*:

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(3.2) — `is_convertible_v<const T&, const charT*>` is `false`.

4 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return insert(pos, sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& insert(size_type pos1, const T& t,
                                 size_type pos2, size_type n = npos);
```

5 *Constraints*:

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(5.2) — `is_convertible_v<const T&, const charT*>` is `false`.

6 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return insert(pos1, sv.substr(pos2, n));
```

```
constexpr basic_string& insert(size_type pos, const charT* s, size_type n);
```

7 *Preconditions*: `[s, s + n)` is a valid range.

8 *Effects*: Inserts a copy of the range `[s, s + n)` immediately before the character at position `pos` if `pos < size()`, or otherwise at the end of the string.

9 *Returns*: `*this`.

10 *Throws*:

(10.1) — `out_of_range` if `pos > size()`,

(10.2) — `length_error` if `n > max_size() - size()`, or

(10.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& insert(size_type pos, const charT* s);
```

11 *Effects*: Equivalent to: `return insert(pos, s, traits::length(s));`

```
constexpr basic_string& insert(size_type pos, size_type n, charT c);
```

12 *Effects*: Inserts `n` copies of `c` before the character at position `pos` if `pos < size()`, or otherwise at the end of the string.

13 *Returns*: `*this`

14 *Throws*:

(14.1) — `out_of_range` if `pos > size()`,

(14.2) — `length_error` if `n > max_size() - size()`, or

(14.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr iterator insert(const_iterator p, charT c);
```

15 *Preconditions*: `p` is a valid iterator on `*this`.

16 *Effects*: Inserts a copy of `c` at the position `p`.

17 *Returns*: An iterator which refers to the inserted character.

```
constexpr iterator insert(const_iterator p, size_type n, charT c);
```

18 *Preconditions*: `p` is a valid iterator on `*this`.

19 *Effects*: Inserts `n` copies of `c` at the position `p`.

20 *Returns*: An iterator which refers to the first inserted character, or `p` if `n == 0`.

```
template<class InputIterator>
  constexpr iterator insert(const_iterator p, InputIterator first, InputIterator last);
```

21 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (22.2.1).

22 *Preconditions*: `p` is a valid iterator on `*this`.

23 *Effects*: Equivalent to `insert(p - begin(), basic_string(first, last, get_allocator()))`.

24 *Returns*: An iterator which refers to the first inserted character, or `p` if `first == last`.

```
constexpr iterator insert(const_iterator p, initializer_list<charT> il);
```

25 *Effects*: Equivalent to: `return insert(p, il.begin(), il.end());`

21.3.3.7.5 `basic_string::erase` [string.erase]

```
constexpr basic_string& erase(size_type pos = 0, size_type n = npos);
```

1 *Effects*: Determines the effective length `xlen` of the string to be removed as the smaller of `n` and `size() - pos`. Removes the characters in the range `[begin() + pos, begin() + pos + xlen)`.

2 *Returns*: `*this`.

3 *Throws*: `out_of_range` if `pos > size()`.

```
constexpr iterator erase(const_iterator p);
```

4 *Preconditions*: `p` is a valid dereferenceable iterator on `*this`.

5 *Effects*: Removes the character referred to by `p`.

6 *Returns*: An iterator which points to the element immediately following `p` prior to the element being erased. If no such element exists, `end()` is returned.

7 *Throws*: Nothing.

```
constexpr iterator erase(const_iterator first, const_iterator last);
```

8 *Preconditions*: `first` and `last` are valid iterators on `*this`. `[first, last)` is a valid range.

9 *Effects*: Removes the characters in the range `[first, last)`.

10 *Returns*: An iterator which points to the element pointed to by `last` prior to the other elements being erased. If no such element exists, `end()` is returned.

11 *Throws*: Nothing.

```
constexpr void pop_back();
```

12 *Preconditions*: `!empty()`.

13 *Effects*: Equivalent to `erase(end() - 1)`.

14 *Throws*: Nothing.

21.3.3.7.6 `basic_string::replace` [string.replace]

```
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str);
```

1 *Effects*: Equivalent to: `return replace(pos1, n1, str.data(), str.size());`

```
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str,
                                size_type pos2, size_type n2 = npos);
```

2 *Effects*: Equivalent to:

```
return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));
```

```
template<class T>
  constexpr basic_string& replace(size_type pos1, size_type n1, const T& t);
```

3 *Constraints*:

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(3.2) — `is_convertible_v<const T&, const charT*>` is `false`.

4 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& replace(size_type pos1, size_type n1, const T& t,
                                  size_type pos2, size_type n2 = npos);
```

5 *Constraints*:

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(5.2) — `is_convertible_v<const T&, const charT*>` is `false`.

6 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.substr(pos2, n2));
```

```
constexpr basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);
```

7 *Preconditions*: `[s, s + n2)` is a valid range.

8 *Effects*: Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size() - pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the characters in the range `[begin() + pos1, begin() + pos1 + xlen)` with a copy of the range `[s, s + n2)`.

9 *Returns*: `*this`.

10 *Throws*:

(10.1) — `out_of_range` if `pos1 > size()`,

(10.2) — `length_error` if the length of the resulting string would exceed `max_size()`, or

(10.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& replace(size_type pos, size_type n, const charT* s);
```

11 *Effects*: Equivalent to: `return replace(pos, n, s, traits::length(s));`

```
constexpr basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);
```

12 *Effects*: Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size() - pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the characters in the range `[begin() + pos1, begin() + pos1 + xlen)` with `n2` copies of `c`.

13 *Returns*: `*this`.

14 *Throws*:

(14.1) — `out_of_range` if `pos1 > size()`,

(14.2) — `length_error` if the length of the resulting string would exceed`max_size()`, or

(14.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate.`

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);
```

15 *Effects*: Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(str));`

```
template<class T>
  constexpr basic_string& replace(const_iterator i1, const_iterator i2, const T& t);
```

16 *Constraints*:

(16.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(16.2) — `is_convertible_v<const T&, const charT*>` is `false`.

17 *Preconditions*: `[begin(), i1)` and `[i1, i2)` are valid ranges.

18 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(i1 - begin(), i2 - i1, sv.data(), sv.size());
```

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);
```

19 *Effects*: Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s, n));`

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);
```

20 *Effects*: Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s));`

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, size_type n, charT c);
```

21 *Preconditions*: `[begin(), i1)` and `[i1, i2)` are valid ranges.

22 *Effects*: Equivalent to: `return replace(i1 - begin(), i2 - i1, n, c);`

```
template<class InputIterator>
  constexpr basic_string& replace(const_iterator i1, const_iterator i2,
                                  InputIterator j1, InputIterator j2);
```

23 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (22.2.1).

24 *Effects*: Equivalent to: `return replace(i1, i2, basic_string(j1, j2, get_allocator()));`

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);
```

25 *Effects*: Equivalent to: `return replace(i1, i2, il.begin(), il.size());`

21.3.3.7.7 `basic_string::copy` [string.copy]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1 *Effects*: Equivalent to: `return basic_string_view<charT, traits>(*this).copy(s, n, pos);`

[*Note 1*: This does not terminate `s` with a null object. — *end note*]

21.3.3.7.8 `basic_string::swap` [string.swap]

```
constexpr void swap(basic_string& s)
  noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

1 *Preconditions*: `allocator_traits<Allocator>::propagate_on_container_swap::value` is `true` or `get_allocator() == s.get_allocator()`.

2 *Postconditions*: `*this` contains the same sequence of characters that was in `s`, `s` contains the same sequence of characters that was in `*this`.

3 *Throws*: Nothing.

4 *Complexity*: Constant time.

21.3.3.8 String operations [string.ops]

21.3.3.8.1 Accessors [string.accessors]

```
constexpr const charT* c_str() const noexcept;
constexpr const charT* data() const noexcept;
```

1 *Returns*: A pointer `p` such that `p + i == addressof(operator[](i))` for each `i` in `[0, size()]`.

2 *Complexity*: Constant time.

3 *Remarks*: The program shall not modify any of the values stored in the character array; otherwise, the behavior is undefined.

```
constexpr charT* data() noexcept;
```

4 *Returns*: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()].

5 *Complexity*: Constant time.

6 *Remarks*: The program shall not modify the value stored at p + size() to any value other than charT(); otherwise, the behavior is undefined.

```
constexpr operator basic_string_view<charT, traits>() const noexcept;
```

7 *Effects*: Equivalent to: return basic_string_view<charT, traits>(data(), size());

```
constexpr allocator_type get_allocator() const noexcept;
```

8 *Returns*: A copy of the Allocator object used to construct the string or, if that allocator has been replaced, a copy of the most recent replacement.

21.3.3.8.2 Searching [string.find]

1 Let *F* be one of find, rfind, find_first_of, find_last_of, find_first_not_of, and find_last_not_of.

(1.1) — Each member function of the form

```
constexpr size_type F(const basic_string& str, size_type pos) const noexcept;
```

has effects equivalent to: return *F*(basic_string_view<charT, traits>(str), pos);

(1.2) — Each member function of the form

```
constexpr size_type F(const charT* s, size_type pos) const;
```

has effects equivalent to: return *F*(basic_string_view<charT, traits>(s), pos);

(1.3) — Each member function of the form

```
constexpr size_type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: return *F*(basic_string_view<charT, traits>(s, n), pos);

(1.4) — Each member function of the form

```
constexpr size_type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to:

```
return F(basic_string_view<charT, traits>(addressof(c), 1), pos);
```

```
template<class T>
  constexpr size_type find(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
  constexpr size_type rfind(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
  constexpr size_type find_first_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
  constexpr size_type find_last_of(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
  constexpr size_type find_first_not_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
  constexpr size_type find_last_not_of(const T& t, size_type pos = npos) const noexcept(see below);
```

2 *Constraints*:

(2.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and

(2.2) — is_convertible_v<const T&, const charT*> is false.

3 *Effects*: Let *G* be the name of the function. Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
return s.G(sv, pos);
```

4 *Remarks*: The expression inside noexcept is equivalent to is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>.

21.3.3.8.3 `basic_string::substr` [string.substr]

```
constexpr basic_string substr(size_type pos = 0, size_type n = npos) const;
```

1 *Effects*: Determines the effective length `rlen` of the string to copy as the smaller of `n` and `size() - pos`.

2 *Returns*: `basic_string(data()+pos, rlen)`.

3 *Throws*: `out_of_range` if `pos > size()`.

21.3.3.8.4 `basic_string::compare` [string.compare]

```
template<class T>
  constexpr int compare(const T& t) const noexcept(see below);
```

1 *Constraints*:

(1.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(1.2) — `is_convertible_v<const T&, const charT*>` is `false`.

2 *Effects*: Equivalent to: `return basic_string_view<charT, traits>(*this).compare(t);`

3 *Remarks*: The expression inside `noexcept` is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

```
template<class T>
  constexpr int compare(size_type pos1, size_type n1, const T& t) const;
```

4 *Constraints*:

(4.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(4.2) — `is_convertible_v<const T&, const charT*>` is `false`.

5 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(*this).substr(pos1, n1).compare(t);
```

```
template<class T>
  constexpr int compare(size_type pos1, size_type n1, const T& t,
                        size_type pos2, size_type n2 = npos) const;
```

6 *Constraints*:

(6.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(6.2) — `is_convertible_v<const T&, const charT*>` is `false`.

7 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
return s.substr(pos1, n1).compare(sv.substr(pos2, n2));
```

```
constexpr int compare(const basic_string& str) const noexcept;
```

8 *Effects*: Equivalent to: `return compare(basic_string_view<charT, traits>(str));`

```
constexpr int compare(size_type pos1, size_type n1, const basic_string& str) const;
```

9 *Effects*: Equivalent to: `return compare(pos1, n1, basic_string_view<charT, traits>(str));`

```
constexpr int compare(size_type pos1, size_type n1, const basic_string& str,
                      size_type pos2, size_type n2 = npos) const;
```

10 *Effects*: Equivalent to:

```
return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);
```

```
constexpr int compare(const charT* s) const;
```

11 *Effects*: Equivalent to: `return compare(basic_string_view<charT, traits>(s));`

```
constexpr int compare(size_type pos, size_type n1, const charT* s) const;
```

12 *Effects*: Equivalent to: `return compare(pos, n1, basic_string_view<charT, traits>(s));`

```
constexpr int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;
```

13 *Effects*: Equivalent to: `return compare(pos, n1, basic_string_view<charT, traits>(s, n2));`

21.3.3.8.5 `basic_string::starts_with` [string.starts.with]

```
constexpr bool starts_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool starts_with(charT x) const noexcept;
constexpr bool starts_with(const charT* x) const;
```

1 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).starts_with(x);
```

21.3.3.8.6 `basic_string::ends_with` [string.ends.with]

```
constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool ends_with(charT x) const noexcept;
constexpr bool ends_with(const charT* x) const;
```

1 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).ends_with(x);
```

21.3.4 Non-member functions [string.nonmembers]

21.3.4.1 `operator+` [string.op.plus]

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs,
              const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);
```

1 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.append(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs,
              const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs, const charT* rhs);
```

2 *Effects*: Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs,
              basic_string<charT, traits, Allocator>&& rhs);
```

3 *Effects*: Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

except that both `lhs` and `rhs` are left in valid but unspecified states.

[*Note 1*: If `lhs` and `rhs` have equal allocators, the implementation can move from either. — *end note*]

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs,
              basic_string<charT, traits, Allocator>&& rhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const charT* lhs, basic_string<charT, traits, Allocator>&& rhs);
```

4 *Effects*: Equivalent to:

```
rhs.insert(0, lhs);
return std::move(rhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
```

5 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(0, lhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(charT lhs, const basic_string<charT, traits, Allocator>& rhs);
```

6 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(r.begin(), lhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(charT lhs, basic_string<charT, traits, Allocator>&& rhs);
```

7 *Effects*: Equivalent to:

```
rhs.insert(rhs.begin(), lhs);
return std::move(rhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);
```

8 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.push_back(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs, charT rhs);
```

9 *Effects*: Equivalent to:

```
lhs.push_back(rhs);
return std::move(lhs);
```

21.3.4.2 Non-member comparison operator functions [string.cmp]

```
template<class charT, class traits, class Allocator>
  constexpr bool
    operator==(const basic_string<charT, traits, Allocator>& lhs,
               const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
  constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
                            const charT* rhs);

template<class charT, class traits, class Allocator>
  constexpr see below operator<=>(const basic_string<charT, traits, Allocator>& lhs,
                                  const basic_string<charT, traits, Allocator>& rhs) noexcept;
```

```
template<class charT, class traits, class Allocator>
  constexpr see below operator<=>(const basic_string<charT, traits, Allocator>& lhs,
                                   const charT* rhs);
```

1 *Effects*: Let *op* be the operator. Equivalent to:

```
return basic_string_view<charT, traits>(lhs) op basic_string_view<charT, traits>(rhs);
```

21.3.4.3 swap [string.special]

```
template<class charT, class traits, class Allocator>
  constexpr void
    swap(basic_string<charT, traits, Allocator>& lhs,
         basic_string<charT, traits, Allocator>& rhs)
      noexcept(noexcept(lhs.swap(rhs)));
```

1 *Effects*: Equivalent to `lhs.swap(rhs)`.

21.3.4.4 Inserters and extractors [string.io]

```
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, basic_string<charT, traits, Allocator>& str);
```

1 *Effects*: Behaves as a formatted input function (29.7.4.3.1). After constructing a `sentry` object, if the sentry converts to `true`, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1, c)`. If `is.width()` is greater than zero, the maximum number `n` of characters appended is `is.width()`; otherwise `n` is `str.max_size()`. Characters are extracted and appended until any of the following occurs:

(1.1) — *n* characters are stored;

(1.2) — end-of-file occurs on the input sequence;

(1.3) — `isspace(c, is.getloc())` is `true` for the next available input character *c*.

2 After the last character (if any) is extracted, `is.width(0)` is called and the `sentry` object is destroyed.

3 If the function extracts no characters, it calls `is.setstate(ios_base::failbit)`, which may throw `ios_base::failure` (29.5.5.4).

4 *Returns*: `is`.

```
template<class charT, class traits, class Allocator>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os,
               const basic_string<charT, traits, Allocator>& str);
```

5 *Effects*: Equivalent to: `return os << basic_string_view<charT, traits>(str);`

```
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>& is,
            basic_string<charT, traits, Allocator>& str,
            charT delim);
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>&& is,
            basic_string<charT, traits, Allocator>& str,
            charT delim);
```

6 *Effects*: Behaves as an unformatted input function (29.7.4.4), except that it does not affect the value returned by subsequent calls to `basic_istream<>::gcount()`. After constructing a `sentry` object, if the sentry converts to `true`, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1, c)` until any of the following occurs:

(6.1) — end-of-file occurs on the input sequence (in which case, the `getline` function calls `is.setstate( ios_base::eofbit)`).

(6.2) — `traits::eq(c, delim)` for the next available input character *c* (in which case, *c* is extracted but not appended) (29.5.5.4)

(6.3) — `str.max_size()` characters are stored (in which case, the function calls `is.setstate(ios_base::failbit)`) (29.5.5.4)

7 The conditions are tested in the order shown. In any case, after the last character is extracted, the `sentry` object is destroyed.

8 If the function extracts no characters, it calls `is.setstate(ios_base::failbit)` which may throw `ios_base::failure` (29.5.5.4).

9 *Returns*: `is`.

```
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>& is,
            basic_string<charT, traits, Allocator>& str);
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>&& is,
            basic_string<charT, traits, Allocator>& str);
```

10 *Returns*: `getline(is, str, is.widen('\n'))`.

21.3.4.5 Erasure [string.erasure]

```
template<class charT, class traits, class Allocator, class U>
  constexpr typename basic_string<charT, traits, Allocator>::size_type
    erase(basic_string<charT, traits, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class charT, class traits, class Allocator, class Predicate>
  constexpr typename basic_string<charT, traits, Allocator>::size_type
    erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

21.3.5 Numeric conversions [string.conversions]

```
int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);
```

1 *Effects*: The first two functions call `strtol(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base)`, `strtoll(str.c_str(), ptr, base)`, and `strtoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

2 *Returns*: The converted result.

3 *Throws*: `invalid_argument` if `strtol`, `strtoul`, `strtoll`, or `strtoull` reports that no conversion could be performed. Throws `out_of_range` if `strtol`, `strtoul`, `strtoll` or `strtoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

```
float stof(const string& str, size_t* idx = nullptr);
double stod(const string& str, size_t* idx = nullptr);
```

```
long double stold(const string& str, size_t* idx = nullptr);
```

4 *Effects*: These functions call `strtof(str.c_str(), ptr)`, `strtod(str.c_str(), ptr)`, and `strtold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

5 *Returns*: The converted result.

6 *Throws*: `invalid_argument` if `strtof`, `strtod`, or `strtold` reports that no conversion could be performed. Throws `out_of_range` if `strtof`, `strtod`, or `strtold` sets `errno` to `ERANGE` or if the converted value is outside the range of representable values for the return type.

```
string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(unsigned long long val);
string to_string(float val);
string to_string(double val);
string to_string(long double val);
```

7 *Returns*: Each function returns a `string` object holding the character representation of the value of its argument that would be generated by calling `sprintf(buf, fmt, val)` with a format specifier of `"%d"`, `"%u"`, `"%ld"`, `"%lu"`, `"%lld"`, `"%llu"`, `"%f"`, `"%f"`, or `"%Lf"`, respectively, where `buf` designates an internal character buffer of sufficient size.

```
int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);
```

8 *Effects*: The first two functions call `wcstol(str.c_str(), ptr, base)`, and the last three functions call `wcstoul(str.c_str(), ptr, base)`, `wcstoll(str.c_str(), ptr, base)`, and `wcstoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

9 *Returns*: The converted result.

10 *Throws*: `invalid_argument` if `wcstol`, `wcstoul`, `wcstoll`, or `wcstoull` reports that no conversion could be performed. Throws `out_of_range` if the converted value is outside the range of representable values for the return type.

```
float stof(const wstring& str, size_t* idx = nullptr);
double stod(const wstring& str, size_t* idx = nullptr);
long double stold(const wstring& str, size_t* idx = nullptr);
```

11 *Effects*: These functions call `wcstof(str.c_str(), ptr)`, `wcstod(str.c_str(), ptr)`, and `wcstold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

12 *Returns*: The converted result.

13 *Throws*: `invalid_argument` if `wcstof`, `wcstod`, or `wcstold` reports that no conversion could be performed. Throws `out_of_range` if `wcstof`, `wcstod`, or `wcstold` sets `errno` to `ERANGE`.

```
wstring to_wstring(int val);
wstring to_wstring(unsigned val);
wstring to_wstring(long val);
wstring to_wstring(unsigned long val);
wstring to_wstring(long long val);
```

```
wstring to_wstring(unsigned long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
wstring to_wstring(long double val);
```

14 *Returns*: Each function returns a `wstring` object holding the character representation of the value of its argument that would be generated by calling `swprintf(buf, buffsz, fmt, val)` with a format specifier of `L"%d"`, `L"%u"`, `L"%ld"`, `L"%lu"`, `L"%lld"`, `L"%llu"`, `L"%f"`, `L"%f"`, or `L"%Lf"`, respectively, where `buf` designates an internal character buffer of sufficient size `buffsz`.

21.3.6 Hash support [basic.string.hash]

```
template<> struct hash<string>;
template<> struct hash<u8string>;
template<> struct hash<u16string>;
template<> struct hash<u32string>;
template<> struct hash<wstring>;
template<> struct hash<pmr::string>;
template<> struct hash<pmr::u8string>;
template<> struct hash<pmr::u16string>;
template<> struct hash<pmr::u32string>;
template<> struct hash<pmr::wstring>;
```

1 If `S` is one of these string types, `SV` is the corresponding string view type, and `s` is an object of type `S`, then `hash<S>()(s) == hash<SV>()(SV(s))`.

21.3.7 Suffix for `basic_string` literals [basic.string.literals]

```
constexpr string operator""s(const char* str, size_t len);
```

1 *Returns*: `string{str, len}`.

```
constexpr u8string operator""s(const char8_t* str, size_t len);
```

2 *Returns*: `u8string{str, len}`.

```
constexpr u16string operator""s(const char16_t* str, size_t len);
```

3 *Returns*: `u16string{str, len}`.

```
constexpr u32string operator""s(const char32_t* str, size_t len);
```

4 *Returns*: `u32string{str, len}`.

```
constexpr wstring operator""s(const wchar_t* str, size_t len);
```

5 *Returns*: `wstring{str, len}`.

6 [*Note 1*: The same suffix `s` is used for `chrono::duration` literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — *end note*]

21.4 String view classes [string.view]

21.4.1 General [string.view.general]

1 The class template `basic_string_view` describes an object that can refer to a constant contiguous sequence of char-like (21.1) objects with the first element of the sequence at position zero. In the rest of 21.4, the type of the char-like objects held in a `basic_string_view` object is designated by `charT`.

2 [*Note 1*: The library provides implicit conversions from `const charT*` and `std::basic_string<charT, ...>` to `std::basic_string_view<charT, ...>` so that user code can accept just `std::basic_string_view<charT>` as a non-templated parameter wherever a sequence of characters is expected. User-defined types can define their own implicit conversions to `std::basic_string_view` in order to interoperate with these functions. — *end note*]

21.4.2 Header `<string_view>` synopsis [string.view.synop]

```
#include <compare>              // see 17.11.1

namespace std {
  // 21.4.3, class template basic_string_view
  template<class charT, class traits = char_traits<charT>>
  class basic_string_view;
```

```
  template<class charT, class traits>
    inline constexpr bool ranges::enable_view<basic_string_view<charT, traits>> = true;
  template<class charT, class traits>
    inline constexpr bool ranges::enable_borrowed_range<basic_string_view<charT, traits>> = true;

  // 21.4.5, non-member comparison functions
  template<class charT, class traits>
    constexpr bool operator==(basic_string_view<charT, traits> x,
                              basic_string_view<charT, traits> y) noexcept;
  template<class charT, class traits>
    constexpr see below operator<=>(basic_string_view<charT, traits> x,
                                    basic_string_view<charT, traits> y) noexcept;

  // see 21.4.5, sufficient additional overloads of comparison functions

  // 21.4.6, inserters and extractors
  template<class charT, class traits>
    basic_ostream<charT, traits>&
      operator<<(basic_ostream<charT, traits>& os,
                 basic_string_view<charT, traits> str);

  // basic_string_view typedef names
  using string_view    = basic_string_view<char>;

  using wstring_view   = basic_string_view<wchar_t>;

  // 21.4.7, hash support
  template<class T> struct hash;
  template<> struct hash<string_view>;
  template<> struct hash<u8string_view>;
  template<> struct hash<u16string_view>;
  template<> struct hash<u32string_view>;
  template<> struct hash<wstring_view>;

  inline namespace literals {
  inline namespace string_view_literals {
    // 21.4.8, suffix for basic_string_view literals
    constexpr string_view    operator""sv(const char* str, size_t len) noexcept;
    constexpr u8string_view  operator""sv(const char8_t* str, size_t len) noexcept;
    constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
    constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
    constexpr wstring_view   operator""sv(const wchar_t* str, size_t len) noexcept;
  }
  }
}
```

1 The function templates defined in 20.2.2 and 23.7 are available when `<string_view>` is included.

21.4.3 Class template basic_string_view [string.view.template]

21.4.3.1 General [string.view.template.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_string_view {
  public:
    // types
    using traits_type            = traits;
    using value_type             = charT;
    using pointer                = value_type*;
    using const_pointer          = const value_type*;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using const_iterator         = implementation-defined; // see 21.4.3.3
```

```
using iterator               = const_iterator;229
using const_reverse_iterator = reverse_iterator<const_iterator>;
using reverse_iterator       = const_reverse_iterator;
using size_type              = size_t;
using difference_type        = ptrdiff_t;
static constexpr size_type npos = size_type(-1);

// 21.4.3.2, construction and assignment
constexpr basic_string_view() noexcept;
constexpr basic_string_view(const basic_string_view&) noexcept = default;
constexpr basic_string_view& operator=(const basic_string_view&) noexcept = default;
constexpr basic_string_view(const charT* str);
constexpr basic_string_view(const charT* str, size_type len);
template<class It, class End>
  constexpr basic_string_view(It begin, End end);

// 21.4.3.3, iterator support
constexpr const_iterator begin() const noexcept;
constexpr const_iterator end() const noexcept;
constexpr const_iterator cbegin() const noexcept;
constexpr const_iterator cend() const noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

// 21.4.3.4, capacity
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
constexpr size_type max_size() const noexcept;
[[nodiscard]] constexpr bool empty() const noexcept;

// 21.4.3.5, element access
constexpr const_reference operator[](size_type pos) const;
constexpr const_reference at(size_type pos) const;
constexpr const_reference front() const;
constexpr const_reference back() const;
constexpr const_pointer data() const noexcept;

// 21.4.3.6, modifiers
constexpr void remove_prefix(size_type n);
constexpr void remove_suffix(size_type n);
constexpr void swap(basic_string_view& s) noexcept;

// 21.4.3.7, string operations
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;

constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;

constexpr int compare(basic_string_view s) const noexcept;
constexpr int compare(size_type pos1, size_type n1, basic_string_view s) const;
constexpr int compare(size_type pos1, size_type n1, basic_string_view s,
                      size_type pos2, size_type n2) const;
constexpr int compare(const charT* s) const;
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;

constexpr bool starts_with(basic_string_view x) const noexcept;
constexpr bool starts_with(charT x) const noexcept;
constexpr bool starts_with(const charT* x) const;
constexpr bool ends_with(basic_string_view x) const noexcept;
constexpr bool ends_with(charT x) const noexcept;
```

229) Because `basic_string_view` refers to a constant sequence, `iterator` and `const_iterator` are the same type.

```
    constexpr bool ends_with(const charT* x) const;

    // 21.4.3.8, searching
    constexpr size_type find(basic_string_view s, size_type pos = 0) const noexcept;
    constexpr size_type find(charT c, size_type pos = 0) const noexcept;
    constexpr size_type find(const charT* s, size_type pos, size_type n) const;
    constexpr size_type find(const charT* s, size_type pos = 0) const;
    constexpr size_type rfind(basic_string_view s, size_type pos = npos) const noexcept;
    constexpr size_type rfind(charT c, size_type pos = npos) const noexcept;
    constexpr size_type rfind(const charT* s, size_type pos, size_type n) const;
    constexpr size_type rfind(const charT* s, size_type pos = npos) const;

    constexpr size_type find_first_of(basic_string_view s, size_type pos = 0) const noexcept;
    constexpr size_type find_first_of(charT c, size_type pos = 0) const noexcept;
    constexpr size_type find_first_of(const charT* s, size_type pos, size_type n) const;
    constexpr size_type find_first_of(const charT* s, size_type pos = 0) const;
    constexpr size_type find_last_of(basic_string_view s, size_type pos = npos) const noexcept;
    constexpr size_type find_last_of(charT c, size_type pos = npos) const noexcept;
    constexpr size_type find_last_of(const charT* s, size_type pos, size_type n) const;
    constexpr size_type find_last_of(const charT* s, size_type pos = npos) const;
    constexpr size_type find_first_not_of(basic_string_view s, size_type pos = 0) const noexcept;
    constexpr size_type find_first_not_of(charT c, size_type pos = 0) const noexcept;
    constexpr size_type find_first_not_of(const charT* s, size_type pos,
                                          size_type n) const;
    constexpr size_type find_first_not_of(const charT* s, size_type pos = 0) const;
    constexpr size_type find_last_not_of(basic_string_view s,
                                         size_type pos = npos) const noexcept;
    constexpr size_type find_last_not_of(charT c, size_type pos = npos) const noexcept;
    constexpr size_type find_last_not_of(const charT* s, size_type pos,
                                         size_type n) const;
    constexpr size_type find_last_not_of(const charT* s, size_type pos = npos) const;

  private:
    const_pointer data_;        // exposition only
    size_type size_;            // exposition only
  };

  // 21.4.4, deduction guide
  template<class It, class End>
    basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
}
```

1 In every specialization `basic_string_view<charT, traits>`, the type `traits` shall meet the character traits requirements (21.2).

[*Note 1*: The program is ill-formed if `traits::char_type` is not the same type as `charT`. — *end note*]

2 For a `basic_string_view str`, any operation that invalidates a pointer in the range `[str.data(), str.data() + str.size())` invalidates pointers, iterators, and references returned from `str`'s member functions.

3 The complexity of `basic_string_view` member functions is $\mathcal{O}(1)$ unless otherwise specified.

21.4.3.2 Construction and assignment [string.view.cons]

`constexpr basic_string_view() noexcept;`

1 *Postconditions*: `size_ == 0` and `data_ == nullptr`.

`constexpr basic_string_view(const charT* str);`

2 *Preconditions*: `[str, str + traits::length(str))` is a valid range.

3 *Effects*: Constructs a `basic_string_view`, initializing `data_` with `str` and initializing `size_` with `traits::length(str)`.

4 *Complexity*: $\mathcal{O}$(`traits::length(str)`).

```
constexpr basic_string_view(const charT* str, size_type len);
```

5 *Preconditions*: [str, str + len) is a valid range.

6 *Effects*: Constructs a basic_string_view, initializing data_ with str and initializing size_ with len.

```
template<class It, class End>
  constexpr basic_string_view(It begin, End end);
```

7 *Constraints*:

(7.1) — It satisfies contiguous_iterator.

(7.2) — End satisfies sized_sentinel_for<It>.

(7.3) — is_same_v<iter_value_t<It>, charT> is true.

(7.4) — is_convertible_v<End, size_type> is false.

8 *Preconditions*:

(8.1) — [begin, end) is a valid range.

(8.2) — It models contiguous_iterator.

(8.3) — End models sized_sentinel_for<It>.

9 *Effects*: Initializes data_ with to_address(begin) and initializes size_ with end - begin.

21.4.3.3 Iterator support [string.view.iterators]

```
using const_iterator = implementation-defined;
```

1 A type that meets the requirements of a constant *Cpp17RandomAccessIterator* (23.3.5.7), models contiguous_iterator (23.3.4.14), and meets the constexpr iterator requirements (23.3.1), whose value_type is the template parameter charT.

2 All requirements on container iterators (22.2) apply to basic_string_view::const_iterator as well.

```
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;
```

3 *Returns*: An iterator such that

(3.1) — if !empty(), addressof(*begin()) == data_,

(3.2) — otherwise, an unspecified value such that [begin(), end()) is a valid range.

```
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;
```

4 *Returns*: begin() + size().

```
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
```

5 *Returns*: const_reverse_iterator(end()).

```
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;
```

6 *Returns*: const_reverse_iterator(begin()).

21.4.3.4 Capacity [string.view.capacity]

```
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
```

1 *Returns*: size_.

```
constexpr size_type max_size() const noexcept;
```

2 *Returns*: The largest possible number of char-like objects that can be referred to by a basic_string_view.

```
[[nodiscard]] constexpr bool empty() const noexcept;
```

3 *Returns*: size_ == 0.

21.4.3.5 Element access [string.view.access]

```
constexpr const_reference operator[](size_type pos) const;
```

1 *Preconditions*: `pos < size()`.

2 *Returns*: `data_[pos]`.

3 *Throws*: Nothing.

4 [*Note 1*: Unlike `basic_string::operator[]`, `basic_string_view::operator[](size())` has undefined behavior instead of returning `charT()`. — *end note*]

```
constexpr const_reference at(size_type pos) const;
```

5 *Returns*: `data_[pos]`.

6 *Throws*: `out_of_range` if `pos >= size()`.

```
constexpr const_reference front() const;
```

7 *Preconditions*: `!empty()`.

8 *Returns*: `data_[0]`.

9 *Throws*: Nothing.

```
constexpr const_reference back() const;
```

10 *Preconditions*: `!empty()`.

11 *Returns*: `data_[size() - 1]`.

12 *Throws*: Nothing.

```
constexpr const_pointer data() const noexcept;
```

13 *Returns*: `data_`.

14 [*Note 2*: Unlike `basic_string::data()` and *string-literal*s, `data()` can return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass `data()` to a function that takes just a `const charT*` and expects a null-terminated string. — *end note*]

21.4.3.6 Modifiers [string.view.modifiers]

```
constexpr void remove_prefix(size_type n);
```

1 *Preconditions*: `n <= size()`.

2 *Effects*: Equivalent to: `data_ += n; size_ -= n;`

```
constexpr void remove_suffix(size_type n);
```

3 *Preconditions*: `n <= size()`.

4 *Effects*: Equivalent to: `size_ -= n;`

```
constexpr void swap(basic_string_view& s) noexcept;
```

5 *Effects*: Exchanges the values of `*this` and `s`.

21.4.3.7 String operations [string.view.ops]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1 Let `rlen` be the smaller of `n` and `size() - pos`.

2 *Preconditions*: `[s, s + rlen)` is a valid range.

3 *Effects*: Equivalent to `traits::copy(s, data() + pos, rlen)`.

4 *Returns*: `rlen`.

5 *Throws*: `out_of_range` if `pos > size()`.

6 *Complexity*: $\mathcal{O}$(`rlen`).

```
constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;
```

7 Let `rlen` be the smaller of `n` and `size() - pos`.

8 *Effects*: Determines `rlen`, the effective length of the string to reference.

9 *Returns*: `basic_string_view(data() + pos, rlen)`.

10 *Throws*: `out_of_range` if `pos > size()`.

```
constexpr int compare(basic_string_view str) const noexcept;
```

11 Let `rlen` be the smaller of `size()` and `str.size()`.

12 *Effects*: Determines `rlen`, the effective length of the strings to compare. The function then compares the two strings by calling `traits::compare(data(), str.data(), rlen)`.

13 *Returns*: The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 70.

Table 70: `compare()` results [tab:string.view.compare]

Condition	Return Value
`size() < str.size()`	`< 0`
`size() == str.size()`	`0`
`size() > str.size()`	`> 0`

14 *Complexity*: $\mathcal{O}$(`rlen`).

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;
```

15 *Effects*: Equivalent to: `return substr(pos1, n1).compare(str);`

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str,
                      size_type pos2, size_type n2) const;
```

16 *Effects*: Equivalent to: `return substr(pos1, n1).compare(str.substr(pos2, n2));`

```
constexpr int compare(const charT* s) const;
```

17 *Effects*: Equivalent to: `return compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
```

18 *Effects*: Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;
```

19 *Effects*: Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s, n2));`

```
constexpr bool starts_with(basic_string_view x) const noexcept;
```

20 *Effects*: Equivalent to: `return substr(0, x.size()) == x;`

```
constexpr bool starts_with(charT x) const noexcept;
```

21 *Effects*: Equivalent to: `return !empty() && traits::eq(front(), x);`

```
constexpr bool starts_with(const charT* x) const;
```

22 *Effects*: Equivalent to: `return starts_with(basic_string_view(x));`

```
constexpr bool ends_with(basic_string_view x) const noexcept;
```

23 *Effects*: Equivalent to:

```
return size() >= x.size() && compare(size() - x.size(), npos, x) == 0;
```

```
constexpr bool ends_with(charT x) const noexcept;
```

24 *Effects*: Equivalent to: `return !empty() && traits::eq(back(), x);`

```
constexpr bool ends_with(const charT* x) const;
```

25 *Effects*: Equivalent to: `return ends_with(basic_string_view(x));`

21.4.3.8 Searching [string.view.find]

1 Member functions in this subclause have complexity $\mathscr{O}$(`size() * str.size()`) at worst, although implementations should do better.

2 Let *F* be one of `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.

(2.1) — Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos) const;
```

has effects equivalent to: `return F(basic_string_view(s), pos);`

(2.2) — Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: `return F(basic_string_view(s, n), pos);`

(2.3) — Each member function of the form

```
constexpr return-type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to: `return F(basic_string_view(addressof(c), 1), pos);`

```
constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;
```

3 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(3.1) — `pos <= xpos`

(3.2) — `xpos + str.size() <= size()`

(3.3) — `traits::eq(at(xpos + I), str.at(I))` for all elements `I` of the string referenced by `str`.

4 *Effects*: Determines `xpos`.

5 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;
```

6 Let `xpos` be the highest position, if possible, such that the following conditions hold:

(6.1) — `xpos <= pos`

(6.2) — `xpos + str.size() <= size()`

(6.3) — `traits::eq(at(xpos + I), str.at(I))` for all elements `I` of the string referenced by `str`.

7 *Effects*: Determines `xpos`.

8 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;
```

9 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(9.1) — `pos <= xpos`

(9.2) — `xpos < size()`

(9.3) — `traits::eq(at(xpos), str.at(I))` for some element `I` of the string referenced by `str`.

10 *Effects*: Determines `xpos`.

11 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;
```

12 Let `xpos` be the highest position, if possible, such that the following conditions hold:

(12.1) — `xpos <= pos`

(12.2) — `xpos < size()`

(12.3) — `traits::eq(at(xpos), str.at(I))` for some element `I` of the string referenced by `str`.

13 *Effects*: Determines `xpos`.

14 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;
```

15 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(15.1) — `pos <= xpos`

(15.2) — `xpos < size()`

(15.3) — `traits::eq(at(xpos), str.at(I))` for no element `I` of the string referenced by `str`.

16 *Effects*: Determines `xpos`.

17 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

```
constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;
```

18 Let `xpos` be the highest position, if possible, such that the following conditions hold:

(18.1) — `xpos <= pos`

(18.2) — `xpos < size()`

(18.3) — `traits::eq(at(xpos), str.at(I))` for no element `I` of the string referenced by `str`.

19 *Effects*: Determines `xpos`.

20 *Returns*: `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

21.4.4 Deduction guide [string.view.deduct]

```
template<class It, class End>
  basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
```

1 *Constraints*:

(1.1) — `It` satisfies `contiguous_iterator`.

(1.2) — `End` satisfies `sized_sentinel_for<It>`.

21.4.5 Non-member comparison functions [string.view.comparison]

1 Let `S` be `basic_string_view<charT, traits>`, and `sv` be an instance of `S`. Implementations shall provide sufficient additional overloads marked `constexpr` and `noexcept` so that an object `t` with an implicit conversion to `S` can be compared according to Table 71.

Table 71: Additional `basic_string_view` comparison overloads [tab:string.view.comparison.overloads]

Expression	Equivalent to
`t == sv`	`S(t) == sv`
`sv == t`	`sv == S(t)`
`t != sv`	`S(t) != sv`
`sv != t`	`sv != S(t)`
`t < sv`	`S(t) < sv`
`sv < t`	`sv < S(t)`
`t > sv`	`S(t) > sv`
`sv > t`	`sv > S(t)`
`t <= sv`	`S(t) <= sv`
`sv <= t`	`sv <= S(t)`
`t >= sv`	`S(t) >= sv`
`sv >= t`	`sv >= S(t)`
`t <=> sv`	`S(t) <=> sv`
`sv <=> t`	`sv <=> S(t)`

[*Example 1*: A sample conforming implementation for `operator==` would be:

```
template<class charT, class traits>
  constexpr bool operator==(basic_string_view<charT, traits> lhs,
                            basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
  }
template<class charT, class traits>
  constexpr bool operator==(basic_string_view<charT, traits> lhs,
                            type_identity_t<basic_string_view<charT, traits>> rhs) noexcept {
    return lhs.compare(rhs) == 0;
```

```
}
```

— *end example*]

```
template<class charT, class traits>
  constexpr bool operator==(basic_string_view<charT, traits> lhs,
                            basic_string_view<charT, traits> rhs) noexcept;
```

2 *Returns*: `lhs.compare(rhs) == 0`.

```
template<class charT, class traits>
  constexpr see below operator<=>(basic_string_view<charT, traits> lhs,
                                  basic_string_view<charT, traits> rhs) noexcept;
```

3 Let `R` denote the type `traits::comparison_category` if it exists, otherwise `R` is `weak_ordering`.

4 *Returns*: `static_cast<R>(lhs.compare(rhs) <=> 0)`.

21.4.6 Inserters and extractors [string.view.io]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);
```

1 *Effects*: Behaves as a formatted output function (29.7.5.3.1) of `os`. Forms a character sequence `seq`, initially consisting of the elements defined by the range `[str.begin(), str.end())`. Determines padding for `seq` as described in 29.7.5.3.1. Then inserts `seq` as if by calling `os.rdbuf()->sputn(seq, n)`, where `n` is the larger of `os.width()` and `str.size()`; then calls `os.width(0)`.

2 *Returns*: `os`

21.4.7 Hash support [string.view.hash]

```
template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;
```

1 The specialization is enabled (20.14.19).

[*Note 1*: The hash value of a string view object is equal to the hash value of the corresponding string object (21.3.6). — *end note*]

21.4.8 Suffix for `basic_string_view` literals [string.view.literals]

```
constexpr string_view operator""sv(const char* str, size_t len) noexcept;
```

1 *Returns*: `string_view{str, len}`.

```
constexpr u8string_view operator""sv(const char8_t* str, size_t len) noexcept;
```

2 *Returns*: `u8string_view{str, len}`.

```
constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
```

3 *Returns*: `u16string_view{str, len}`.

```
constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
```

4 *Returns*: `u32string_view{str, len}`.

```
constexpr wstring_view operator""sv(const wchar_t* str, size_t len) noexcept;
```

5 *Returns*: `wstring_view{str, len}`.

21.5 Null-terminated sequence utilities [c.strings]

21.5.1 Header `<cctype>` synopsis [cctype.syn]

```
namespace std {
  int isalnum(int c);
  int isalpha(int c);
  int isblank(int c);
```

```
  int iscntrl(int c);
  int isdigit(int c);
  int isgraph(int c);
  int islower(int c);
  int isprint(int c);
  int ispunct(int c);
  int isspace(int c);
  int isupper(int c);
  int isxdigit(int c);
  int tolower(int c);
  int toupper(int c);
}
```

1 The contents and meaning of the header `<cctype>` are the same as the C standard library header `<ctype.h>`.

See also: ISO C 7.4

21.5.2 Header `<cwctype>` synopsis [cwctype.syn]

```
namespace std {
  using wint_t = see below;
  using wctrans_t = see below;
  using wctype_t = see below;

  int iswalnum(wint_t wc);
  int iswalpha(wint_t wc);
  int iswblank(wint_t wc);
  int iswcntrl(wint_t wc);
  int iswdigit(wint_t wc);
  int iswgraph(wint_t wc);
  int iswlower(wint_t wc);
  int iswprint(wint_t wc);
  int iswpunct(wint_t wc);
  int iswspace(wint_t wc);
  int iswupper(wint_t wc);
  int iswxdigit(wint_t wc);
  int iswctype(wint_t wc, wctype_t desc);
  wctype_t wctype(const char* property);
  wint_t towlower(wint_t wc);
  wint_t towupper(wint_t wc);
  wint_t towctrans(wint_t wc, wctrans_t desc);
  wctrans_t wctrans(const char* property);
}

#define WEOF see below
```

1 The contents and meaning of the header `<cwctype>` are the same as the C standard library header `<wctype.h>`.

See also: ISO C 7.30

21.5.3 Header `<cstring>` synopsis [cstring.syn]

```
namespace std {
  using size_t = see 17.2.4;

  void* memcpy(void* s1, const void* s2, size_t n);
  void* memmove(void* s1, const void* s2, size_t n);
  char* strcpy(char* s1, const char* s2);
  char* strncpy(char* s1, const char* s2, size_t n);
  char* strcat(char* s1, const char* s2);
  char* strncat(char* s1, const char* s2, size_t n);
  int memcmp(const void* s1, const void* s2, size_t n);
  int strcmp(const char* s1, const char* s2);
  int strcoll(const char* s1, const char* s2);
  int strncmp(const char* s1, const char* s2, size_t n);
  size_t strxfrm(char* s1, const char* s2, size_t n);
  const void* memchr(const void* s, int c, size_t n);           // see 16.2
```

```
    void* memchr(void* s, int c, size_t n);                          // see 16.2
    const char* strchr(const char* s, int c);                        // see 16.2
    char* strchr(char* s, int c);                                    // see 16.2
    size_t strcspn(const char* s1, const char* s2);
    const char* strpbrk(const char* s1, const char* s2);             // see 16.2
    char* strpbrk(char* s1, const char* s2);                         // see 16.2
    const char* strrchr(const char* s, int c);                       // see 16.2
    char* strrchr(char* s, int c);                                   // see 16.2
    size_t strspn(const char* s1, const char* s2);
    const char* strstr(const char* s1, const char* s2);              // see 16.2
    char* strstr(char* s1, const char* s2);                          // see 16.2
    char* strtok(char* s1, const char* s2);
    void* memset(void* s, int c, size_t n);
    char* strerror(int errnum);
    size_t strlen(const char* s);
  }

  #define NULL see 17.2.3
```

1 The contents and meaning of the header `<cstring>` are the same as the C standard library header `<string.h>`.

2 The functions `strerror` and `strtok` are not required to avoid data races (16.4.6.10).

3 The functions `memcpy` and `memmove` are signal-safe (17.13.5). Both functions implicitly create objects (6.7.2) in the destination region of storage immediately prior to copying the sequence of characters to the destination.

4 [*Note 1*: The functions `strchr`, `strpbrk`, `strrchr`, `strstr`, and `memchr`, have different signatures in this document, but they have the same behavior as in the C standard library (16.2). — *end note*]

  size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
  size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
  size_t mbrtoc16(char16_t* pc16, const char* s, size_t n, mbstate_t* ps);
  size_t c16rtomb(char* s, char16_t c16, mbstate_t* ps);
  size_t mbrtoc32(char32_t* pc32, const char* s, size_t n, mbstate_t* ps);
```

```
    size_t c32rtomb(char* s, char32_t c32, mbstate_t* ps);
  }
```

1 The contents and meaning of the header `<cuchar>` are the same as the C standard library header `<uchar.h>`, except that it declares the additional `mbrtoc8` and `c8rtomb` functions and does not declare types `char16_t` nor `char32_t`.

SEE ALSO: ISO C 7.28

21.5.6 Multibyte / wide string and character conversion functions [c.mb.wcs]

1 [*Note 1*: The headers `<cstdlib>` (17.2.2), `<cuchar>` (21.5.5), and `<cwchar>` (21.5.4) declare the functions described in this subclause. — *end note*]

```
int mbsinit(const mbstate_t* ps);
int mblen(const char* s, size_t n);
size_t mbstowcs(wchar_t* pwcs, const char* s, size_t n);
size_t wcstombs(char* s, const wchar_t* pwcs, size_t n);
```

2 *Effects*: These functions have the semantics specified in the C standard library.

SEE ALSO: ISO C 7.22.7.1, 7.22.8, 7.29.6.2.1

```
int mbtowc(wchar_t* pwc, const char* s, size_t n);
int wctomb(char* s, wchar_t wchar);
```

3 *Effects*: These functions have the semantics specified in the C standard library.

4 *Remarks*: Calls to these functions may introduce a data race (16.4.6.10) with other calls to the same function.

SEE ALSO: ISO C 7.22.7

```
size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
size_t mbrtowc(wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wcrtomb(char* s, wchar_t wc, mbstate_t* ps);
size_t mbsrtowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);
```

5 *Effects*: These functions have the semantics specified in the C standard library.

6 *Remarks*: Calling these functions with an `mbstate_t*` argument that is a null pointer value may introduce a data race (16.4.6.10) with other calls to the same function with an `mbstate_t*` argument that is a null pointer value.

SEE ALSO: ISO C 7.29.6.3

```
size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
```

7 *Effects*: If `s` is a null pointer, equivalent to `mbrtoc8(nullptr, "", 1, ps)`. Otherwise, the function inspects at most `n` bytes beginning with the byte pointed to by `s` to determine the number of bytes needed to complete the next multibyte character (including any shift sequences). If the function determines that the next multibyte character is complete and valid, it determines the values of the corresponding UTF-8 code units and then, if `pc8` is not a null pointer, stores the value of the first (or only) such code unit in the object pointed to by `pc8`. Subsequent calls will store successive UTF-8 code units without consuming any additional input until all the code units have been stored. If the corresponding Unicode character is U+0000, the resulting state described is the initial conversion state.

8 *Returns*: The first of the following that applies (given the current conversion state):

(8.1) — `0`, if the next `n` or fewer bytes complete the multibyte character that corresponds to the U+0000 Unicode character (which is the value stored).

(8.2) — between `1` and `n` (inclusive), if the next n or fewer bytes complete a valid multibyte character (which is the value stored); the value returned is the number of bytes that complete the multibyte character.

(8.3) — `(size_t)(-3)`, if the next character resulting from a previous call has been stored (no bytes from the input have been consumed by this call).

(8.4) — `(size_t)(-2)`, if the next `n` bytes contribute to an incomplete (but potentially valid) multibyte character, and all `n` bytes have been processed (no value is stored).

(8.5) — `(size_t)(-1)`, if an encoding error occurs, in which case the next `n` or fewer bytes do not contribute to a complete and valid multibyte character (no value is stored); the value of the macro `EILSEQ` is stored in `errno`, and the conversion state is unspecified.

```
size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
```

9 *Effects*: If `s` is a null pointer, equivalent to `c8rtomb(buf, u8'\0', ps)` where `buf` is an internal buffer. Otherwise, if `c8` completes a sequence of valid UTF-8 code units, determines the number of bytes needed to represent the multibyte character (including any shift sequences), and stores the multibyte character representation in the array whose first element is pointed to by `s`. At most `MB_CUR_MAX` bytes are stored. If the multibyte character is a null character, a null byte is stored, preceded by any shift sequence needed to restore the initial shift state; the resulting state described is the initial conversion state.

10 *Returns*: The number of bytes stored in the array object (including any shift sequences). If `c8` does not contribute to a sequence of `char8_t` corresponding to a valid multibyte character, the value of the macro `EILSEQ` is stored in `errno`, `(size_t) (-1)` is returned, and the conversion state is unspecified.

11 *Remarks*: Calls to `c8rtomb` with a null pointer argument for `s` may introduce a data race (16.4.6.10) with other calls to `c8rtomb` with a null pointer argument for `s`.

22 Containers library [containers]

22.1 General [containers.general]

1 This Clause describes components that C++ programs may use to organize collections of information.

2 The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in Table 72.

Table 72: Containers library summary [tab:containers.summary]

	Subclause	Header
22.2	Requirements	
22.3	Sequence containers	`<array>`, `<deque>`, `<forward_list>`, `<list>`, `<vector>`
22.4	Associative containers	`<map>`, `<set>`
22.5	Unordered associative containers	`<unordered_map>`, `<unordered_set>`
22.6	Container adaptors	`<queue>`, `<stack>`
22.7	Views	`<span>`

22.2 Container requirements [container.requirements]

22.2.1 General container requirements [container.requirements.general]

1 Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.

2 All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects.

[*Example 1*: The copy constructor of type `vector<vector<int>>` has linear complexity, even though the complexity of copying each contained `vector<int>` is itself linear. — *end example*]

3 For the components affected by this subclause that declare an `allocator_type`, objects stored in these components shall be constructed using the function `allocator_traits<allocator_type>::rebind_traits<U>::construct` and destroyed using the function `allocator_traits<allocator_type>::rebind_traits<U>::destroy` (20.10.9.3), where `U` is either `allocator_type::value_type` or an internal type used by the container. These functions are called only for the container's element type, not for internal types used by the container.

[*Note 1*: This means, for example, that a node-based container might need to construct nodes containing aligned buffers and call `construct` to place the element into the buffer. — *end note*]

4 In Tables 73, 74, and 75 `X` denotes a container class containing objects of type `T`, `a` and `b` denote values of type `X`, `i` and `j` denote values of type (possibly const) `X::iterator`, `u` denotes an identifier, `r` denotes a non-const value of type `X`, and `rv` denotes a non-const rvalue of type `X`.

Table 73: Container requirements [tab:container.req]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition	Complexity
`X::value_type`	`T`		*Preconditions*: `T` is *Cpp17Erasable* from `X` (see 22.2.1, below)	compile time
`X::reference`	`T&`			compile time
`X::const_reference`	`const T&`			compile time

Table 73: Container requirements (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition	Complexity
`X::iterator`	iterator type whose value type is `T`		any iterator category that meets the forward iterator requirements. convertible to `X::const_iterator`.	compile time
`X::const_iterator`	constant iterator type whose value type is `T`		any iterator category that meets the forward iterator requirements.	compile time
`X::difference_type`	signed integer type		is identical to the difference type of `X::iterator` and `X::const_iterator`	compile time
`X::size_type`	unsigned integer type		`size_type` can represent any non-negative value of `difference_type`	compile time
`X u;`			*Postconditions*: `u.empty()`	constant
`X()`			*Postconditions*: `X().empty()`	constant
`X(a)`			*Preconditions*: `T` is *Cpp17CopyInsertable* into `X` (see below). *Postconditions*: `a == X(a)`.	linear
`X u(a);` `X u = a;`			*Preconditions*: `T` is *Cpp17CopyInsertable* into `X` (see below). *Postconditions*: `u == a`	linear
`X u(rv);` `X u = rv;`			*Postconditions*: `u` is equal to the value that `rv` had before this construction	(Note B)
`a = rv`	`X&`	All existing elements of `a` are either move assigned to or destroyed	*Postconditions*: `a` is equal to the value that `rv` had before this assignment	linear
`a.~X()`	`void`		*Effects*: destroys every element of `a`; any memory obtained is deallocated.	linear
`a.begin()`	`iterator`; `const_iterator` for constant `a`			constant
`a.end()`	`iterator`; `const_iterator` for constant `a`			constant

Table 73: Container requirements (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition	Complexity
`a.cbegin()`	`const_iterator`	`const_cast<X const&>(a) .begin();`		constant
`a.cend()`	`const_iterator`	`const_cast<X const&>(a).end();`		constant
`i <=> j`	`strong_ordering`		*Constraints*: `X::iterator` meets the random access iterator requirements.	constant
`a == b`	convertible to `bool`	`==` is an equivalence relation. `equal(a.begin(), a.end(), b.begin(), b.end())`	*Preconditions*: `T` meets the *Cpp17EqualityComparable* requirements	Constant if `a.size() != b.size()`, linear otherwise
`a != b`	convertible to `bool`	Equivalent to `!(a == b)`		linear
`a.swap(b)`	`void`		*Effects*: exchanges the contents of `a` and `b`	(Note A)
`swap(a, b)`	`void`	Equivalent to `a.swap(b)`		(Note A)
`r = a`	`X&`		*Postconditions*: `r == a`.	linear
`a.size()`	`size_type`	`distance( a.begin(), a.end())`		constant
`a.max_size()`	`size_type`	`distance(begin(), end())` for the largest possible container		constant
`a.empty()`	convertible to `bool`	`a.begin() == a.end()`		constant

Those entries marked "(Note A)" or "(Note B)" have linear complexity for `array` and have constant complexity for all other standard containers.

[*Note 2*: The algorithm `equal` is defined in Clause 25. — *end note*]

5 The member function `size()` returns the number of elements in the container. The number of elements is defined by the rules of constructors, inserts, and erases.

6 `begin()` returns an iterator referring to the first element in the container. `end()` returns an iterator which is the past-the-end value for the container. If the container is empty, then `begin() == end()`.

7 In the expressions

```
i == j
i != j
i < j
i <= j
i >= j
i > j
i <=> j
i - j
```

where `i` and `j` denote objects of a container's `iterator` type, either or both may be replaced by an object of the container's `const_iterator` type referring to the same element with no change in semantics.

8 Unless otherwise specified, all containers defined in this Clause obtain memory using an allocator (see 16.4.4.6).

[*Note 3*: In particular, containers and iterators do not store references to allocated elements other than through the allocator's pointer type, i.e., as objects of type `P` or `pointer_traits<P>::template rebind<`*`unspecified`*`>`, where `P` is `allocator_traits<allocator_type>::pointer`. — *end note*]

Copy constructors for these container types obtain an allocator by calling `allocator_traits<allocator_type>::select_on_container_copy_construction` on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a `const allocator_type&` argument.

[*Note 4*: If an invocation of a constructor uses the default value of an optional allocator argument, then the allocator type must support value-initialization. — *end note*]

A copy of this allocator is used for any memory allocation and element construction performed, by these constructors and by all member functions, during the lifetime of each container object or until the allocator is replaced. The allocator may be replaced only via assignment or `swap()`. Allocator replacement is performed by copy assignment, move assignment, or swapping of the allocator only if

(8.1) — `allocator_traits<allocator_type>::propagate_on_container_copy_assignment::value`,

(8.2) — `allocator_traits<allocator_type>::propagate_on_container_move_assignment::value`, or

(8.3) — `allocator_traits<allocator_type>::propagate_on_container_swap::value`

is `true` within the implementation of the corresponding container operation. In all container types defined in this Clause, the member `get_allocator()` returns a copy of the allocator used to construct the container or, if that allocator has been replaced, a copy of the most recent replacement.

9 The expression `a.swap(b)`, for containers `a` and `b` of a standard container type other than `array`, shall exchange the values of `a` and `b` without invoking any move, copy, or swap operations on the individual container elements. Lvalues of any `Compare`, `Pred`, or `Hash` types belonging to `a` and `b` shall be swappable and shall be exchanged by calling `swap` as described in 16.4.4.3. If `allocator_traits<allocator_type>::propagate_on_container_swap::value` is `true`, then lvalues of type `allocator_type` shall be swappable and the allocators of `a` and `b` shall also be exchanged by calling `swap` as described in 16.4.4.3. Otherwise, the allocators shall not be swapped, and the behavior is undefined unless `a.get_allocator() == b.get_allocator()`. Every iterator referring to an element in one container before the swap shall refer to the same element in the other container after the swap. It is unspecified whether an iterator with value `a.end()` before the swap will have value `b.end()` after the swap.

10 If the iterator type of a container belongs to the bidirectional or random access iterator categories (23.3), the container is called *reversible* and meets the additional requirements in Table 74.

Table 74: Reversible container requirements [tab:container.rev.req]

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::reverse_iterator`	iterator type whose value type is `T`	`reverse_iterator<iterator>`	compile time
`X::const_reverse_iterator`	constant iterator type whose value type is `T`	`reverse_iterator<const_iterator>`	compile time
`a.rbegin()`	`reverse_iterator`; `const_reverse_iterator` for constant `a`	`reverse_iterator(end())`	constant
`a.rend()`	`reverse_iterator`; `const_reverse_iterator` for constant `a`	`reverse_iterator(begin())`	constant
`a.crbegin()`	`const_reverse_iterator`	`const_cast<X const&>(a).rbegin()`	constant
`a.crend()`	`const_reverse_iterator`	`const_cast<X const&>(a).rend()`	constant

11 Unless otherwise specified (see 22.2.6.2, 22.2.7.2, 22.3.8.4, and 22.3.11.5) all container types defined in this Clause meet the following additional requirements:

(11.1) — if an exception is thrown by an `insert()` or `emplace()` function while inserting a single element, that function has no effects.

(11.2) — if an exception is thrown by a `push_back()`, `push_front()`, `emplace_back()`, or `emplace_front()` function, that function has no effects.

(11.3) — no `erase()`, `clear()`, `pop_back()` or `pop_front()` function throws an exception.

(11.4) — no copy constructor or assignment operator of a returned iterator throws an exception.

(11.5) — no `swap()` function throws an exception.

(11.6) — no `swap()` function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped.

[*Note 5*: The `end()` iterator does not refer to any element, so it can be invalidated. — *end note*]

12 Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.

13 A *contiguous container* is a container whose member types `iterator` and `const_iterator` meet the *Cpp17RandomAccessIterator* requirements (23.3.5.7) and model `contiguous_iterator` (23.3.4.14).

14 Table 75 lists operations that are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics described in Table 75 unless otherwise stated. If the iterators passed to `lexicographical_compare_three_way` meet the constexpr iterator requirements (23.3.1) then the operations described in Table 75 are implemented by constexpr functions.

Table 75: Optional container operations [tab:container.opt]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition	Complexity
`a <=> b`	*`synth-three-way-result`*`<value_type>`	`lexicographical_compare_three_way(a.begin(), a.end(), b.begin(), b.end(),` *`synth-three-way`*`)`	*Preconditions*: Either `<=>` is defined for values of type (possibly const) `T`, or `<` is defined for values of type (possibly const) `T` and `<` is a total ordering relationship.	linear

[*Note 6*: The algorithm `lexicographical_compare_three_way` is defined in Clause 25. — *end note*]

15 All of the containers defined in this Clause and in 21.3.3 except `array` meet the additional requirements of an allocator-aware container, as described in Table 76.

16 Given an allocator type `A` and given a container type `X` having a `value_type` identical to `T` and an `allocator_type` identical to `allocator_traits<A>::rebind_alloc<T>` and given an lvalue `m` of type `A`, a pointer `p` of type `T*`, an expression `v` of type (possibly `const`) `T`, and an rvalue `rv` of type `T`, the following terms are defined. If `X` is not allocator-aware, the terms below are defined as if `A` were `allocator<T>` — no allocator object needs to be created and user specializations of `allocator<T>` are not instantiated:

(16.1) — `T` is *Cpp17DefaultInsertable into* `X` means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p)
```

(16.2) — An element of `X` is *default-inserted* if it is initialized by evaluation of the expression

```
allocator_traits<A>::construct(m, p)
```

where `p` is the address of the uninitialized storage for the element allocated within `X`.

(16.3) — `T` is *Cpp17MoveInsertable into* `X` means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, rv)
```

and its evaluation causes the following postcondition to hold: The value of `*p` is equivalent to the value of `rv` before the evaluation.

[*Note 7*: `rv` remains a valid object. Its state is unspecified — *end note*]

(16.4) — `T` is *Cpp17CopyInsertable into `X`* means that, in addition to `T` being *Cpp17MoveInsertable* into `X`, the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, v)
```

and its evaluation causes the following postcondition to hold: The value of `v` is unchanged and is equivalent to `*p`.

(16.5) — `T` is *Cpp17EmplaceConstructible into `X` from `args`*, for zero or more arguments `args`, means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, args)
```

(16.6) — `T` is *Cpp17Erasable from `X`* means that the following expression is well-formed:

```
allocator_traits<A>::destroy(m, p)
```

[*Note 8*: A container calls `allocator_traits<A>::construct(m, p, args)` to construct an element at `p` using `args`, with `m == get_allocator()`. The default `construct` in `allocator` will call `::new((void*)p) T(args)`, but specialized allocators can choose a different definition. — *end note*]

17 In Table 76, `X` denotes an allocator-aware container class with a `value_type` of `T` using allocator of type `A`, `u` denotes a variable, `a` and `b` denote non-const lvalues of type `X`, `t` denotes an lvalue or a const rvalue of type `X`, `rv` denotes a non-const rvalue of type `X`, and `m` is a value of type `A`.

Table 76: Allocator-aware container requirements [tab:container.alloc.req]

Expression	**Return type**	**Assertion/note pre-/post-condition**	**Complexity**
`allocator_type`	`A`	*Mandates*: `allocator_type::value_type` is the same as `X::value_type`.	compile time
`get_allocator()`	`A`		constant
`X()` `X u;`		*Preconditions*: `A` meets the *Cpp17DefaultConstructible* requirements. *Postconditions*: `u.empty()` returns `true`, `u.get_allocator() == A()`	constant
`X(m)` `X u(m);`		*Postconditions*: `u.empty()` returns `true`, `u.get_allocator() == m`	constant
`X(t, m)` `X u(t, m);`		*Preconditions*: `T` is *Cpp17CopyInsertable* into `X`. *Postconditions*: `u == t`, `u.get_allocator() == m`	linear
`X(rv)` `X u(rv);`		*Postconditions*: `u` has the same elements as `rv` had before this construction; the value of `u.get_allocator()` is the same as the value of `rv.get_allocator()` before this construction.	constant
`X(rv, m)` `X u(rv, m);`		*Preconditions*: `T` is *Cpp17MoveInsertable* into `X`. *Postconditions*: `u` has the same elements, or copies of the elements, that `rv` had before this construction, `u.get_allocator() == m`	constant if `m == rv.get_allocator()`, otherwise linear

Table 76: Allocator-aware container requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a = t`	`X&`	*Preconditions*: `T` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*. *Postconditions*: `a == t`	linear
`a = rv`	`X&`	*Preconditions*: If `allocator_traits<allocator_type>::propagate_on_container_move_assignment::value` is `false`, `T` is *Cpp17MoveInsertable* into `X` and *Cpp17MoveAssignable*. *Effects*: All existing elements of `a` are either move assigned to or destroyed. *Postconditions*: `a` is equal to the value that `rv` had before this assignment.	linear
`a.swap(b)`	`void`	*Effects*: exchanges the contents of `a` and `b`	constant

18 The behavior of certain container member functions and deduction guides depends on whether types qualify as input iterators or allocators. The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators. Likewise, the extent to which an implementation determines that a type cannot be an allocator is unspecified, except that as a minimum a type `A` shall not qualify as an allocator unless it meets both of the following conditions:

(18.1) — The *qualified-id* `A::value_type` is valid and denotes a type (13.10.3).

(18.2) — The expression `declval<A&>().allocate(size_t{})` is well-formed when treated as an unevaluated operand.

22.2.2 Container data races [container.requirements.dataraces]

1 For purposes of avoiding data races (16.4.6.10), implementations shall consider the following functions to be `const`: `begin`, `end`, `rbegin`, `rend`, `front`, `back`, `data`, `find`, `lower_bound`, `upper_bound`, `equal_range`, `at` and, except in associative or unordered associative containers, `operator[]`.

2 Notwithstanding 16.4.6.10, implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting `vector<bool>`, are modified concurrently.

3 [*Note 1*: For a `vector<int> x` with a size greater than one, `x[1] = 5` and `*x.begin() = 10` can be executed concurrently without a data race, but `x[0] = 5` and `*x.begin() = 10` executed concurrently can result in a data race. As an exception to the general rule, for a `vector<bool> y`, `y[0] = true` can race with `y[1] = true`. — *end note*]

22.2.3 Sequence containers [sequence.reqmts]

1 A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides four basic kinds of sequence containers: `vector`, `forward_list`, `list`, and `deque`. In addition, `array` is provided as a sequence container which provides limited sequence operations because it has a fixed number of elements. The library also provides container adaptors that make it easy to construct abstract data types, such as `stack`s or `queue`s, out of the basic sequence container kinds (or out of other kinds of sequence containers that the user defines).

2 [*Note 1*: The sequence containers offer the programmer different complexity trade-offs. `vector` is appropriate in most circumstances. `array` has a fixed size known during translation. `list` or `forward_list` support frequent insertions and deletions from the middle of the sequence. `deque` supports efficient insertions and deletions taking place at the beginning or at the end of the sequence. When choosing a container, remember `vector` is best; leave a comment to explain if you choose from the rest! — *end note*]

3 In Tables 77 and 78, `X` denotes a sequence container class, `a` denotes a value of type `X` containing elements of type `T`, `u` denotes the name of a variable being declared, `A` denotes `X::allocator_type` if the *qualified-id* `X::allocator_type` is valid and denotes a type (13.10.3) and `allocator<T>` if it doesn't, `i` and `j` denote iterators that meet the *Cpp17InputIterator* requirements and refer to elements implicitly convertible to `value_type`, `[i, j)` denotes a valid range, `il` designates an object of type `initializer_list<value_type>`, `n` denotes a value of type `X::size_type`, `p` denotes a valid constant iterator to `a`, `q` denotes a valid dereferenceable constant iterator to `a`, `[q1, q2)` denotes a valid range of constant iterators in `a`, `t` denotes an lvalue or a const rvalue of `X::value_type`, and `rv` denotes a non-const rvalue of `X::value_type`. `Args` denotes a template parameter pack; `args` denotes a function parameter pack with the pattern `Args&&`.

4 The complexities of the expressions are sequence dependent.

Table 77: Sequence container requirements (in addition to container) [tab:container.seq.req]

Expression	**Return type**	**Assertion/note pre-/post-condition**
`X(n, t)` `X u(n, t);`		*Preconditions*: `T` is *Cpp17CopyInsertable* into `X`. *Postconditions*: `distance(begin(), end()) == n` *Effects*: Constructs a sequence container with `n` copies of `t`
`X(i, j)` `X u(i, j);`		*Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*i`. For `vector`, if the iterator does not meet the *Cpp17ForwardIterator* requirements (23.3.5.5), `T` is also *Cpp17MoveInsertable* into `X`. *Postconditions*: `distance(begin(), end()) == distance(i, j)` *Effects*: Constructs a sequence container equal to the range `[i, j)`. Each iterator in the range `[i, j)` is dereferenced exactly once.
`X(il)`		Equivalent to `X(il.begin(), il.end())`
`a = il`	`X&`	*Preconditions*: `T` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*. *Effects*: Assigns the range `[il.begin(), il.end())` into `a`. All existing elements of `a` are either assigned to or destroyed. *Returns*: `*this`.
`a.emplace(p, args)`	`iterator`	*Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `args`. For `vector` and `deque`, `T` is also *Cpp17MoveInsertable* into `X` and *Cpp17MoveAssignable*. *Effects*: Inserts an object of type `T` constructed with `std::forward<Args>(args)...` before `p`. [*Note 2*: `args` can directly or indirectly refer to a value in `a`. — *end note*]
`a.insert(p,t)`	`iterator`	*Preconditions*: `T` is *Cpp17CopyInsertable* into `X`. For `vector` and `deque`, `T` is also *Cpp17CopyAssignable*. *Effects*: Inserts a copy of `t` before `p`.
`a.insert(p,rv)`	`iterator`	*Preconditions*: `T` is *Cpp17MoveInsertable* into `X`. For `vector` and `deque`, `T` is also *Cpp17MoveAssignable*. *Effects*: Inserts a copy of `rv` before `p`.

Table 77: Sequence container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition
`a.insert(p,n,t)`	`iterator`	*Preconditions*: `T` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*. *Effects*: Inserts `n` copies of `t` before `p`.
`a.insert(p,i,j)`	`iterator`	*Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*i`. For `vector` and `deque`, `T` is also *Cpp17MoveInsertable* into `X`, *Cpp17MoveConstructible*, *Cpp17MoveAssignable*, and swappable (16.4.4.3). Neither `i` nor `j` are iterators into `a`. *Effects*: Inserts copies of elements in `[i, j)` before `p`. Each iterator in the range `[i, j)` shall be dereferenced exactly once.
`a.insert(p, il)`	`iterator`	`a.insert(p, il.begin(), il.end())`.
`a.erase(q)`	`iterator`	*Preconditions*: For `vector` and `deque`, `T` is *Cpp17MoveAssignable*. *Effects*: Erases the element pointed to by `q`.
`a.erase(q1,q2)`	`iterator`	*Preconditions*: For `vector` and `deque`, `T` is *Cpp17MoveAssignable*. *Effects*: Erases the elements in the range `[q1, q2)`.
`a.clear()`	`void`	*Effects*: Destroys all elements in `a`. Invalidates all references, pointers, and iterators referring to the elements of `a` and may invalidate the past-the-end iterator. *Postconditions*: `a.empty()` is `true`. *Complexity*: Linear.
`a.assign(i,j)`	`void`	*Preconditions*: `T` is *Cpp17EmplaceConstructible* into `X` from `*i` and assignable from `*i`. For `vector`, if the iterator does not meet the forward iterator requirements (23.3.5.5), `T` is also *Cpp17MoveInsertable* into `X`. Neither `i` nor `j` are iterators into `a`. *Effects*: Replaces elements in `a` with a copy of `[i, j)`. Invalidates all references, pointers and iterators referring to the elements of `a`. For `vector` and `deque`, also invalidates the past-the-end iterator. Each iterator in the range `[i, j)` shall be dereferenced exactly once.
`a.assign(il)`	`void`	`a.assign(il.begin(), il.end())`.
`a.assign(n,t)`	`void`	*Preconditions*: `T` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*. `t` is not a reference into `a`. *Effects*: Replaces elements in `a` with `n` copies of `t`. Invalidates all references, pointers and iterators referring to the elements of `a`. For `vector` and `deque`, also invalidates the past-the-end iterator.

5 The iterator returned from `a.insert(p, t)` points to the copy of `t` inserted into `a`.

6 The iterator returned from `a.insert(p, rv)` points to the copy of `rv` inserted into `a`.

7 The iterator returned from `a.insert(p, n, t)` points to the copy of the first element inserted into `a`, or `p` if `n == 0`.

8 The iterator returned from `a.insert(p, i, j)` points to the copy of the first element inserted into `a`, or `p` if `i == j`.

9 The iterator returned from `a.insert(p, il)` points to the copy of the first element inserted into `a`, or `p` if `il` is empty.

10 The iterator returned from `a.emplace(p, args)` points to the new element constructed from `args` into `a`.

11 The iterator returned from `a.erase(q)` points to the element immediately following `q` prior to the element being erased. If no such element exists, `a.end()` is returned.

12 The iterator returned by `a.erase(q1, q2)` points to the element pointed to by `q2` prior to any elements being erased. If no such element exists, `a.end()` is returned.

13 For every sequence container defined in this Clause and in Clause 21:

(13.1) — If the constructor

```
template<class InputIterator>
  X(InputIterator first, InputIterator last,
    const allocator_type& alloc = allocator_type());
```

is called with a type `InputIterator` that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.

(13.2) — If the member functions of the forms:

```
template<class InputIterator>
  return-type F(const_iterator p,
                InputIterator first, InputIterator last);       // such as insert

template<class InputIterator>
  return-type F(InputIterator first, InputIterator last);       // such as append, assign

template<class InputIterator>
  return-type F(const_iterator i1, const_iterator i2,
                InputIterator first, InputIterator last);       // such as replace
```

are called with a type `InputIterator` that does not qualify as an input iterator, then these functions shall not participate in overload resolution.

(13.3) — A deduction guide for a sequence container shall not participate in overload resolution if it has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter, or if it has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

14 Table 78 lists operations that are provided for some types of sequence containers but not others. An implementation shall provide these operations for all container types shown in the "container" column, and shall implement them so as to take amortized constant time.

Table 78: Optional sequence container operations [tab:container.seq.opt]

Expression	Return type	Operational semantics	Container
`a.front()`	`reference`; `const_reference` for constant `a`	`*a.begin()`	`basic_string`, `array`, `deque`, `forward_list`, `list`, `vector`

`a.back()`	`reference`; `const_reference` for constant `a`	`{ auto tmp = a.end();`
		`--tmp;`
		`return *tmp; }`
			`basic_string`, `array`, `deque`, `list`, `vector`

Table 78: Optional sequence container operations (continued)

Expression	Return type	Operational semantics	Container
a.emplace_-front(args)	reference	*Effects*: Prepends an object of type T constructed with std::forward<Args>(args).... *Preconditions*: T is *Cpp17EmplaceConstructible* into X from args. *Returns*: a.front().	deque, forward_list, list
a.emplace_-back(args)	reference	*Effects*: Appends an object of type T constructed with std::forward<Args>(args).... *Preconditions*: T is *Cpp17EmplaceConstructible* into X from args. For vector, T is also *Cpp17MoveInsertable* into X. *Returns*: a.back().	deque, list, vector
a.push_-front(t)	void	*Effects*: Prepends a copy of t. *Preconditions*: T is *Cpp17CopyInsertable* into X.	deque, forward_list, list
a.push_-front(rv)	void	*Effects*: Prepends a copy of rv. *Preconditions*: T is *Cpp17MoveInsertable* into X.	deque, forward_list, list
a.push_-back(t)	void	*Effects*: Appends a copy of t. *Preconditions*: T is *Cpp17CopyInsertable* into X.	basic_string, deque, list, vector
a.push_-back(rv)	void	*Effects*: Appends a copy of rv. *Preconditions*: T is *Cpp17MoveInsertable* into X.	basic_string, deque, list, vector
a.pop_-front()	void	*Effects*: Destroys the first element. *Preconditions*: a.empty() is false.	deque, forward_list, list
a.pop_back()	void	*Effects*: Destroys the last element. *Preconditions*: a.empty() is false.	basic_string, deque, list, vector
a[n]	reference; const_reference for constant a	*(a.begin() + n)	basic_string, array, deque, vector
a.at(n)	reference; const_reference for constant a	*(a.begin() + n)	basic_string, array, deque, vector

15 The member function at() provides bounds-checked access to container elements. at() throws out_of_range if n >= a.size().

22.2.4 Node handles [container.node]

22.2.4.1 Overview [container.node.overview]

1 A *node handle* is an object that accepts ownership of a single element from an associative container (22.2.6) or an unordered associative container (22.2.7). It may be used to transfer that ownership to another container with compatible nodes. Containers with compatible nodes have the same node handle type. Elements may be transferred in either direction between container types in the same row of Table 79.

2 If a node handle is not empty, then it contains an allocator that is equal to the allocator of the container when the element was extracted. If a node handle is empty, it contains no allocator.

Table 79: Container types with compatible nodes [tab:container.node.compat]

`map<K, T, C1, A>`	`map<K, T, C2, A>`
`map<K, T, C1, A>`	`multimap<K, T, C2, A>`
`set<K, C1, A>`	`set<K, C2, A>`
`set<K, C1, A>`	`multiset<K, C2, A>`
`unordered_map<K, T, H1, E1, A>`	`unordered_map<K, T, H2, E2, A>`
`unordered_map<K, T, H1, E1, A>`	`unordered_multimap<K, T, H2, E2, A>`
`unordered_set<K, H1, E1, A>`	`unordered_set<K, H2, E2, A>`
`unordered_set<K, H1, E1, A>`	`unordered_multiset<K, H2, E2, A>`

3 Class *`node-handle`* is for exposition only.

4 If a user-defined specialization of `pair` exists for `pair<const Key, T>` or `pair<Key, T>`, where `Key` is the container's `key_type` and `T` is the container's `mapped_type`, the behavior of operations involving node handles is undefined.

```
template<unspecified>
class node-handle {
public:
  // These type declarations are described in Tables 80 and 81.
  using value_type     = see below;      // not present for map containers
  using key_type       = see below;      // not present for set containers
  using mapped_type    = see below;      // not present for set containers
  using allocator_type = see below;

private:
  using container_node_type = unspecified;
  using ator_traits = allocator_traits<allocator_type>;

  typename ator_traits::template rebind_traits<container_node_type>::pointer ptr_;
  optional<allocator_type> alloc_;

public:
  // 22.2.4.2, constructors, copy, and assignment
  constexpr node-handle() noexcept : ptr_(), alloc_() {}
  node-handle(node-handle&&) noexcept;
  node-handle& operator=(node-handle&&);

  // 22.2.4.3, destructor
  ~node-handle();

  // 22.2.4.4, observers
  value_type& value() const;              // not present for map containers
  key_type& key() const;                  // not present for set containers
  mapped_type& mapped() const;            // not present for set containers

  allocator_type get_allocator() const;
  explicit operator bool() const noexcept;
  [[nodiscard]] bool empty() const noexcept;

  // 22.2.4.5, modifiers
  void swap(node-handle&)
    noexcept(ator_traits::propagate_on_container_swap::value ||
             ator_traits::is_always_equal::value);

  friend void swap(node-handle& x, node-handle& y) noexcept(noexcept(x.swap(y))) {
    x.swap(y);
  }
};
```

22.2.4.2 Constructors, copy, and assignment [container.node.cons]

`node-handle(node-handle&& nh) noexcept;`

1 *Effects*: Constructs a `node-handle` object initializing `ptr_` with `nh.ptr_`. Move constructs `alloc_` with `nh.alloc_`. Assigns `nullptr` to `nh.ptr_` and assigns `nullopt` to `nh.alloc_`.

`node-handle& operator=(node-handle&& nh);`

2 *Preconditions*: Either `!alloc_`, or `ator_traits::propagate_on_container_move_assignment::value` is `true`, or `alloc_ == nh.alloc_`.

3 *Effects*:

(3.1) — If `ptr_ != nullptr`, destroys the `value_type` subobject in the `container_node_type` object pointed to by `ptr_` by calling `ator_traits::destroy`, then deallocates `ptr_` by calling `ator_traits::template rebind_traits<container_node_type>::deallocate`.

(3.2) — Assigns `nh.ptr_` to `ptr_`.

(3.3) — If `!alloc_` or `ator_traits::propagate_on_container_move_assignment::value` is `true`, move assigns `nh.alloc_` to `alloc_`.

(3.4) — Assigns `nullptr` to `nh.ptr_` and assigns `nullopt` to `nh.alloc_`.

4 *Returns*: `*this`.

5 *Throws*: Nothing.

22.2.4.3 Destructor [container.node.dtor]

`~node-handle();`

1 *Effects*: If `ptr_ != nullptr`, destroys the `value_type` subobject in the `container_node_type` object pointed to by `ptr_` by calling `ator_traits::destroy`, then deallocates `ptr_` by calling `ator_traits::template rebind_traits<container_node_type>::deallocate`.

22.2.4.4 Observers [container.node.observers]

`value_type& value() const;`

1 *Preconditions*: `empty() == false`.

2 *Returns*: A reference to the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

3 *Throws*: Nothing.

`key_type& key() const;`

4 *Preconditions*: `empty() == false`.

5 *Returns*: A non-const reference to the `key_type` member of the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

6 *Throws*: Nothing.

7 *Remarks*: Modifying the key through the returned reference is permitted.

`mapped_type& mapped() const;`

8 *Preconditions*: `empty() == false`.

9 *Returns*: A reference to the `mapped_type` member of the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

10 *Throws*: Nothing.

`allocator_type get_allocator() const;`

11 *Preconditions*: `empty() == false`.

12 *Returns*: `*alloc_`.

13 *Throws*: Nothing.

```
explicit operator bool() const noexcept;
```

14 *Returns*: `ptr_ != nullptr`.

```
[[nodiscard]] bool empty() const noexcept;
```

15 *Returns*: `ptr_ == nullptr`.

22.2.4.5 Modifiers [container.node.modifiers]

```
void swap(node-handle& nh)
  noexcept(ator_traits::propagate_on_container_swap::value ||
           ator_traits::is_always_equal::value);
```

1 *Preconditions*: `!alloc_`, or `!nh.alloc_`, or `ator_traits::propagate_on_container_swap::value` is `true`, or `alloc_ == nh.alloc_`.

2 *Effects*: Calls `swap(ptr_, nh.ptr_)`. If `!alloc_`, or `!nh.alloc_`, or `ator_traits::propagate_on_container_swap::value` is `true` calls `swap(alloc_, nh.alloc_)`.

22.2.5 Insert return type [container.insert.return]

1 The associative containers with unique keys and the unordered containers with unique keys have a member function `insert` that returns a nested type `insert_return_type`. That return type is a specialization of the template specified in this subclause.

```
template<class Iterator, class NodeType>
struct insert-return-type
{
  Iterator position;
  bool     inserted;
  NodeType node;
};
```

2 The name *`insert-return-type`* is exposition only. *`insert-return-type`* has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

22.2.6 Associative containers [associative.reqmts]

22.2.6.1 General [associative.reqmts.general]

1 Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of associative containers: `set`, `multiset`, `map` and `multimap`.

2 Each associative container is parameterized on `Key` and an ordering relation `Compare` that induces a strict weak ordering (25.8) on elements of `Key`. In addition, `map` and `multimap` associate an arbitrary *mapped type* `T` with the `Key`. The object of type `Compare` is called the *comparison object* of a container.

3 The phrase "equivalence of keys" means the equivalence relation imposed by the comparison object. That is, two keys `k1` and `k2` are considered to be equivalent if for the comparison object `comp`, `comp(k1, k2) == false && comp(k2, k1) == false`.

[*Note 1*: This is not necessarily the same as the result of `k1 == k2`. — *end note*]

For any two keys `k1` and `k2` in the same container, calling `comp(k1, k2)` shall always return the same value.

4 An associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. The `set` and `map` classes support unique keys; the `multiset` and `multimap` classes support equivalent keys. For `multiset` and `multimap`, `insert`, `emplace`, and `erase` preserve the relative ordering of equivalent elements.

5 For `set` and `multiset` the value type is the same as the key type. For `map` and `multimap` it is equal to `pair<const Key, T>`.

6 `iterator` of an associative container is of the bidirectional iterator category. For associative containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.

[*Note 2*: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — *end note*]

7 The associative containers meet all the requirements of Allocator-aware containers (22.2.1), except that for `map` and `multimap`, the requirements placed on `value_type` in Table 76 apply instead to `key_type` and `mapped_type`.

[*Note 3*: For example, in some cases `key_type` and `mapped_type` are required to be *Cpp17CopyAssignable* even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not *Cpp17CopyAssignable*. — *end note*]

8 In Table 80, `X` denotes an associative container class, `a` denotes a value of type `X`, `a2` denotes a value of a type with nodes compatible with type `X` (Table 79), `b` denotes a possibly `const` value of type `X`, `u` denotes the name of a variable being declared, `a_uniq` denotes a value of type `X` when `X` supports unique keys, `a_eq` denotes a value of type `X` when `X` supports multiple keys, `a_tran` denotes a possibly `const` value of type `X` when the *qualified-id* `X::key_compare::is_transparent` is valid and denotes a type (13.10.3), `i` and `j` meet the *Cpp17InputIterator* requirements and refer to elements implicitly convertible to `value_type`, `[i, j)` denotes a valid range, `p` denotes a valid constant iterator to `a`, `q` denotes a valid dereferenceable constant iterator to `a`, `r` denotes a valid dereferenceable iterator to `a`, `[q1, q2)` denotes a valid range of constant iterators in `a`, `il` designates an object of type `initializer_list<value_type>`, `t` denotes a value of type `X::value_type`, `k` denotes a value of type `X::key_type` and `c` denotes a possibly `const` value of type `X::key_compare`; `kl` is a value such that `a` is partitioned (25.8) with respect to `c(r, kl)`, with `r` the key value of `e` and `e` in `a`; `ku` is a value such that `a` is partitioned with respect to `!c(ku, r)`; `ke` is a value such that `a` is partitioned with respect to `c(r, ke)` and `!c(ke, r)`, with `c(r, ke)` implying `!c(ke, r)`. `A` denotes the storage allocator used by `X`, if any, or `allocator<X::value_type>` otherwise, `m` denotes an allocator of a type convertible to `A`, and `nh` denotes a non-const rvalue of type `X::node_type`.

Table 80: Associative container requirements (in addition to container) [tab:container.assoc.req]

Expression	**Return type**	**Assertion/note pre-/post-condition**	**Complexity**
`X::key_type`	`Key`		compile time
`X::mapped_type` (`map` and `multimap` only)	`T`		compile time
`X::value_type` (`set` and `multiset` only)	`Key`	*Preconditions*: `value_type` is *Cpp17Erasable* from `X`	compile time
`X::value_type` (`map` and `multimap` only)	`pair<const Key, T>`	*Preconditions*: `value_type` is *Cpp17Erasable* from `X`	compile time
`X::key_compare`	`Compare`	*Preconditions*: `key_compare` is *Cpp17CopyConstructible*.	compile time
`X::value_compare`	a binary predicate type	is the same as `key_compare` for `set` and `multiset`; is an ordering relation on pairs induced by the first component (i.e., `Key`) for `map` and `multimap`.	compile time
`X::node_type`	A specialization of a *`node-handle`* class template, such that the public nested types are the same types as the corresponding types in `X`.	see 22.2.4	compile time

Table 80: Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X(c)` `X u(c);`		*Effects*: Constructs an empty container. Uses a copy of `c` as a comparison object.	constant
`X()` `X u;`		*Preconditions*: `key_compare` meets the *Cpp17DefaultConstructible* requirements. *Effects*: Constructs an empty container. Uses `Compare()` as a comparison object	constant
`X(i,j,c)` `X u(i,j,c);`		*Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. *Effects*: Constructs an empty container and inserts elements from the range `[i, j)` into it; uses `c` as a comparison object.	$N \log N$ in general, where N has the value `distance(i, j)`; linear if `[i, j)` is sorted with `value_comp()`
`X(i,j)` `X u(i,j);`		*Preconditions*: `key_compare` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. *Effects*: Same as above, but uses `Compare()` as a comparison object.	same as above
`X(il)`		same as `X(il.begin(), il.end())`	same as `X(il.begin(), il.end())`
`X(il,c)`		same as `X(il.begin(), il.end(), c)`	same as `X(il.begin(), il.end(), c)`
`a = il`	`X&`	*Preconditions*: `value_type` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*. *Effects*: Assigns the range `[il.begin(), il.end())` into `a`. All existing elements of `a` are either assigned to or destroyed.	$N \log N$ in general, where N has the value `il.size() + a.size()`; linear if `[il.begin(), il.end())` is sorted with `value_comp()`
`b.key_-comp()`	`X::key_-compare`	*Returns*: the comparison object out of which `b` was constructed.	constant
`b.value_-comp()`	`X::value_-compare`	*Returns*: an object of `value_compare` constructed out of the comparison object	constant

Table 80: Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a_uniq.emplace(args)`	`pair<iterator, bool>`	*Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`. *Effects*: Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` if and only if there is no element in the container with key equivalent to the key of `t`. The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of `t`.	logarithmic
`a_eq.emplace(args)`	`iterator`	*Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`. *Effects*: Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` and returns the iterator pointing to the newly inserted element. If a range containing elements equivalent to `t` exists in `a_eq`, `t` is inserted at the end of that range.	logarithmic
`a.emplace_hint(p, args)`	`iterator`	*Effects*: Equivalent to `a.emplace( std::forward<Args>(args)...)`. Return value is an iterator pointing to the element with the key equivalent to the newly inserted element. The element is inserted as close as possible to the position just prior to `p`.	logarithmic in general, but amortized constant if the element is inserted right before `p`
`a_uniq.insert(t)`	`pair<iterator, bool>`	*Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`. *Effects*: Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`. The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the `iterator` component of the pair points to the element with key equivalent to the key of `t`.	logarithmic

Table 80: Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a_eq.insert(t)`	`iterator`	*Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`. *Effects*: Inserts `t` and returns the iterator pointing to the newly inserted element. If a range containing elements equivalent to `t` exists in `a_eq`, `t` is inserted at the end of that range.	logarithmic
`a.insert(p, t)`	`iterator`	*Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`. *Effects*: Inserts `t` if and only if there is no element with key equivalent to the key of `t` in containers with unique keys; always inserts `t` in containers with equivalent keys. Always returns the iterator pointing to the element with key equivalent to the key of `t`. `t` is inserted as close as possible to the position just prior to `p`.	logarithmic in general, but amortized constant if `t` is inserted right before `p`.
`a.insert(i, j)`	`void`	*Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. Neither `i` nor `j` are iterators into `a`. *Effects*: Inserts each element from the range `[i, j)` if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.	$N \log(\texttt{a.size()} + N)$, where N has the value `distance(i, j)`
`a.insert(il)`	`void`	*Effects*: Equivalent to `a.insert(il.begin(), il.end())`	

Table 80: Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a_uniq.insert(nh)`	`insert_return_type`	*Preconditions*: `nh` is empty or `a_uniq.get_allocator() == nh.get_allocator()`. *Effects*: If `nh` is empty, has no effect. Otherwise, inserts the element owned by `nh` if and only if there is no element in the container with a key equivalent to `nh.key()`. *Postconditions*: If `nh` is empty, `inserted` is `false`, `position` is `end()`, and `node` is empty. Otherwise if the insertion took place, `inserted` is `true`, `position` points to the inserted element, and `node` is empty; if the insertion failed, `inserted` is `false`, `node` has the previous value of `nh`, and `position` points to an element with a key equivalent to `nh.key()`.	logarithmic
`a_eq.insert(nh)`	`iterator`	*Preconditions*: `nh` is empty or `a_eq.get_allocator() == nh.get_allocator()`. *Effects*: If `nh` is empty, has no effect and returns `a_eq.end()`. Otherwise, inserts the element owned by `nh` and returns an iterator pointing to the newly inserted element. If a range containing elements with keys equivalent to `nh.key()` exists in `a_eq`, the element is inserted at the end of that range. *Postconditions*: `nh` is empty.	logarithmic

Table 80: Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a.insert(p, nh)`	`iterator`	*Preconditions*: `nh` is empty or `a.get_allocator() == nh.get_allocator()`. *Effects*: If `nh` is empty, has no effect and returns `a.end()`. Otherwise, inserts the element owned by `nh` if and only if there is no element with key equivalent to `nh.key()` in containers with unique keys; always inserts the element owned by `nh` in containers with equivalent keys. Always returns the iterator pointing to the element with key equivalent to `nh.key()`. The element is inserted as close as possible to the position just prior to `p`. *Postconditions*: `nh` is empty if insertion succeeds, unchanged if insertion fails.	logarithmic in general, but amortized constant if the element is inserted right before `p`.
`a.extract(k)`	`node_type`	*Effects*: Removes the first element in the container with key equivalent to `k`. *Returns*: A `node_type` owning the element if found, otherwise an empty `node_type`.	log(`a.size()`)
`a.extract(q)`	`node_type`	*Effects*: Removes the element pointed to by `q`. *Returns*: A `node_type` owning that element.	amortized constant
`a.merge(a2)`	`void`	*Preconditions*: `a.get_allocator() == a2.get_allocator()`. *Effects*: Attempts to extract each element in `a2` and insert it into `a` using the comparison object of `a`. In containers with unique keys, if there is an element in `a` with key equivalent to the key of an element from `a2`, then that element is not extracted from `a2`. *Postconditions*: Pointers and references to the transferred elements of `a2` refer to those same elements but as members of `a`. Iterators referring to the transferred elements will continue to refer to their elements, but they now behave as iterators into `a`, not into `a2`. *Throws*: Nothing unless the comparison object throws.	N log(`a.size()`+N), where N has the value `a2.size()`.

Table 80: Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a.erase(k)`	`size_type`	*Effects*: Erases all elements in the container with key equivalent to `k`. *Returns*: The number of erased elements.	log(`a.size()`) + `a.count(k)`
`a.erase(q)`	`iterator`	*Effects*: Erases the element pointed to by `q`. *Returns*: An iterator pointing to the element immediately following `q` prior to the element being erased. If no such element exists, returns `a.end()`.	amortized constant
`a.erase(r)`	`iterator`	*Effects*: Erases the element pointed to by `r`. *Returns*: An iterator pointing to the element immediately following `r` prior to the element being erased. If no such element exists, returns `a.end()`.	amortized constant
`a.erase( q1, q2)`	`iterator`	*Effects*: Erases all the elements in the range `[q1, q2)`. *Returns*: An iterator pointing to the element pointed to by `q2` prior to any elements being erased. If no such element exists, `a.end()` is returned.	log(`a.size()`) + N, where N has the value `distance(q1, q2)`.
`a.clear()`	`void`	*Effects*: Equivalent to `a.erase(a.begin(), a.end())`. *Postconditions*: `a.empty()` is `true`.	linear in `a.size()`.
`b.find(k)`	`iterator`; `const_iterator` for constant `b`.	*Returns*: An iterator pointing to an element with the key equivalent to `k`, or `b.end()` if such an element is not found.	logarithmic
`a_tran. find(ke)`	`iterator`; `const_iterator` for constant `a_tran`.	*Returns*: An iterator pointing to an element with key `r` such that `!c(r, ke) && !c(ke, r)`, or `a_tran.end()` if such an element is not found.	logarithmic
`b.count(k)`	`size_type`	*Returns*: The number of elements with key equivalent to `k`.	log(`b.size()`) + `b.count(k)`
`a_tran. count(ke)`	`size_type`	*Returns*: The number of elements with key `r` such that `!c(r, ke) && !c(ke, r)`	log(`a_tran.size()`) + `a_tran.count(ke)`
`b. contains(k)`	`bool`	*Effects*: Equivalent to: `return b.find(k) != b.end();`	logarithmic
`a_tran. contains(ke)`	`bool`	*Effects*: Equivalent to: `return a_tran.find(ke) != a_tran.end();`	logarithmic

Table 80: Associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`b.lower_bound(k)`	`iterator`; `const_iterator` for constant `b`.	*Returns*: An iterator pointing to the first element with key not less than `k`, or `b.end()` if such an element is not found.	logarithmic
`a_tran.lower_bound(kl)`	`iterator`; `const_iterator` for constant `a_tran`.	*Returns*: An iterator pointing to the first element with key `r` such that `!c(r, kl)`, or `a_tran.end()` if such an element is not found.	logarithmic
`b.upper_bound(k)`	`iterator`; `const_iterator` for constant `b`.	*Returns*: An iterator pointing to the first element with key greater than `k`, or `b.end()` if such an element is not found.	logarithmic
`a_tran.upper_bound(ku)`	`iterator`; `const_iterator` for constant `a_tran`.	*Returns*: An iterator pointing to the first element with key `r` such that `c(ku, r)`, or `a_tran.end()` if such an element is not found.	logarithmic
`b.equal_range(k)`	`pair<iterator, iterator>`; `pair<const_iterator, const_iterator>` for constant `b`.	*Effects*: Equivalent to: `return make_pair(b.lower_bound(k), b.upper_bound(k));`	logarithmic
`a_tran.equal_range(ke)`	`pair<iterator, iterator>`; `pair<const_iterator, const_iterator>` for constant `a_tran`.	*Effects*: Equivalent to: `return make_pair(a_tran.lower_bound(ke), a_tran.upper_bound(ke));`	logarithmic

9 The `insert` and `emplace` members shall not affect the validity of iterators and references to the container, and the `erase` members shall invalidate only iterators and references to the erased elements.

10 The `extract` members invalidate only iterators to the removed element; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a `node_type` is undefined behavior. References and pointers to an element obtained while it is owned by a `node_type` are invalidated if the element is successfully inserted.

11 The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to construct them. For any two dereferenceable iterators `i` and `j` such that distance from `i` to `j` is positive, the following condition holds:

```
value_comp(*j, *i) == false
```

12 For associative containers with unique keys the stronger condition holds:

```
value_comp(*i, *j) != false
```

13 When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, through either a copy constructor or an assignment operator, the target container shall

then use the comparison object from the container being copied, as if that comparison object had been passed to the target container in its constructor.

14 The member function templates `find`, `count`, `contains`, `lower_bound`, `upper_bound`, and `equal_range` shall not participate in overload resolution unless the *qualified-id* `Compare::is_transparent` is valid and denotes a type (13.10.3).

15 A deduction guide for an associative container shall not participate in overload resolution if any of the following are true:

(15.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(15.2) — It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

(15.3) — It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

22.2.6.2 Exception safety guarantees [associative.reqmts.except]

1 For associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's `Compare` object (if any).

2 For associative containers, if an exception is thrown by any operation from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.

3 For associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's `Compare` object (if any).

22.2.7 Unordered associative containers [unord.req]

22.2.7.1 General [unord.req.general]

1 Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: `unordered_set`, `unordered_map`, `unordered_multiset`, and `unordered_multimap`.

2 Unordered associative containers conform to the requirements for Containers (22.2), except that the expressions `a == b` and `a != b` have different semantics than for the other container types.

3 Each unordered associative container is parameterized by `Key`, by a function object type `Hash` that meets the *Cpp17Hash* requirements (16.4.4.5) and acts as a hash function for argument values of type `Key`, and by a binary predicate `Pred` that induces an equivalence relation on values of type `Key`. Additionally, `unordered_map` and `unordered_multimap` associate an arbitrary *mapped type* `T` with the `Key`.

4 The container's object of type `Hash` — denoted by `hash` — is called the *hash function* of the container. The container's object of type `Pred` — denoted by `pred` — is called the *key equality predicate* of the container.

5 Two values `k1` and `k2` are considered equivalent if the container's key equality predicate `pred(k1, k2)` is valid and returns `true` when passed those values. If `k1` and `k2` are equivalent, the container's hash function shall return the same value for both.

[*Note 1*: Thus, when an unordered associative container is instantiated with a non-default `Pred` parameter it usually needs a non-default `Hash` parameter as well. — *end note*]

For any two keys `k1` and `k2` in the same container, calling `pred(k1, k2)` shall always return the same value. For any key `k` in a container, calling `hash(k)` shall always return the same value.

6 An unordered associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. `unordered_set` and `unordered_map` support unique keys. `unordered_multiset` and `unordered_multimap` support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into *equivalent-key groups* such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.

7 For `unordered_set` and `unordered_multiset` the value type is the same as the key type. For `unordered_map` and `unordered_multimap` it is `pair<const Key, T>`.

8 For unordered containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.

[*Note 2*: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — *end note*]

9 The elements of an unordered associative container are organized into *buckets*. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For `unordered_multiset` and `unordered_multimap`, rehashing preserves the relative ordering of equivalent elements.

10 The unordered associative containers meet all the requirements of Allocator-aware containers (22.2.1), except that for `unordered_map` and `unordered_multimap`, the requirements placed on `value_type` in Table 76 apply instead to `key_type` and `mapped_type`.

[*Note 3*: For example, `key_type` and `mapped_type` are sometimes required to be *Cpp17CopyAssignable* even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not *Cpp17CopyAssignable*. — *end note*]

11 In Table 81:

(11.1) — `X` denotes an unordered associative container class,

(11.2) — `a` denotes a value of type `X`,

(11.3) — `a2` denotes a value of a type with nodes compatible with type `X` (Table 79),

(11.4) — `b` denotes a possibly const value of type `X`,

(11.5) — `a_uniq` denotes a value of type `X` when `X` supports unique keys,

(11.6) — `a_eq` denotes a value of type `X` when `X` supports equivalent keys,

(11.7) — `a_tran` denotes a possibly const value of type `X` when the *qualified-ids* `X::key_equal::is_transparent` and `X::hasher::is_transparent` are both valid and denote types (13.10.3),

(11.8) — `i` and `j` denote input iterators that refer to `value_type`,

(11.9) — `[i, j)` denotes a valid range,

(11.10) — `p` and `q2` denote valid constant iterators to `a`,

(11.11) — `q` and `q1` denote valid dereferenceable constant iterators to `a`,

(11.12) — `r` denotes a valid dereferenceable iterator to `a`,

(11.13) — `[q1, q2)` denotes a valid range in `a`,

(11.14) — `il` denotes a value of type `initializer_list<value_type>`,

(11.15) — `t` denotes a value of type `X::value_type`,

(11.16) — `k` denotes a value of type `key_type`,

(11.17) — `hf` denotes a possibly const value of type `hasher`,

(11.18) — `eq` denotes a possibly const value of type `key_equal`,

(11.19) — `ke` is a value such that

(11.19.1) — `eq(r1, ke) == eq(ke, r1)`

(11.19.2) — `hf(r1) == hf(ke)` if `eq(r1, ke)` is `true`, and

(11.19.3) — `(eq(r1, ke) && eq(r1, r2)) == eq(r2, ke)`

where `r1` and `r2` are keys of elements in `a_tran`,

(11.20) — `n` denotes a value of type `size_type`,

(11.21) — `z` denotes a value of type `float`, and

(11.22) — `nh` denotes a non-const rvalue of type `X::node_type`.

Table 81: Unordered associative container requirements (in addition to container) [tab:container.hash.req]

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::key_type`	`Key`		compile time
`X::mapped_type` (`unordered_map` and `unordered_multimap` only)	`T`		compile time
`X::value_type` (`unordered_set` and `unordered_multiset` only)	`Key`	*Preconditions*: `value_type` is *Cpp17Erasable* from `X`	compile time
`X::value_type` (`unordered_map` and `unordered_multimap` only)	`pair<const Key, T>`	*Preconditions*: `value_type` is *Cpp17Erasable* from `X`	compile time
`X::hasher`	`Hash`	*Preconditions*: `Hash` is a unary function object type such that the expression `hf(k)` has type `size_t`.	compile time
`X::key_equal`	`Pred`	*Preconditions*: `Pred` meets the *Cpp17CopyConstructible* requirements. `Pred` is a binary predicate that takes two arguments of type `Key`. `Pred` is an equivalence relation.	compile time
`X::local_iterator`	An iterator type whose category, value type, difference type, and pointer and reference types are the same as `X::iterator`'s.	A `local_iterator` object may be used to iterate through a single bucket, but may not be used to iterate across buckets.	compile time
`X::const_local_-iterator`	An iterator type whose category, value type, difference type, and pointer and reference types are the same as `X::const_iterator`'s.	A `const_local_iterator` object may be used to iterate through a single bucket, but may not be used to iterate across buckets.	compile time
`X::node_type`	a specialization of a *`node-handle`* class template, such that the public nested types are the same types as the corresponding types in `X`.	see 22.2.4	compile time
`X(n, hf, eq)` `X a(n, hf, eq);`	`X`	*Effects*: Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `eq` as the key equality predicate.	$\mathcal{O}$(`n`)

Table 81: Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X(n, hf)` `X a(n, hf);`	`X`	*Preconditions*: `key_equal` meets the *Cpp17DefaultConstructible* requirements. *Effects*: Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `key_equal()` as the key equality predicate.	$\mathcal{O}$(`n`)
`X(n)` `X a(n);`	`X`	*Preconditions*: `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. *Effects*: Constructs an empty container with at least `n` buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate.	$\mathcal{O}$(`n`)
`X()` `X a;`	`X`	*Preconditions*: `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. *Effects*: Constructs an empty container with an unspecified number of buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate.	constant
`X(i, j, n, hf, eq)` `X a(i, j, n, hf, eq);`	`X`	*Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. *Effects*: Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `eq` as the key equality predicate, and inserts elements from `[i, j)` into it.	Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$
`X(i, j, n, hf)` `X a(i, j, n, hf);`	`X`	*Preconditions*: `key_equal` meets the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. *Effects*: Constructs an empty container with at least `n` buckets, using `hf` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `[i, j)` into it.	Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$

Table 81: Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X(i, j, n)` `X a(i, j, n);`	`X`	*Preconditions*: `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. *Effects*: Constructs an empty container with at least `n` buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `[i, j)` into it.	Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$
`X(i, j)` `X a(i, j);`	`X`	*Preconditions*: `hasher` and `key_equal` meet the *Cpp17DefaultConstructible* requirements. `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. *Effects*: Constructs an empty container with an unspecified number of buckets, using `hasher()` as the hash function and `key_equal()` as the key equality predicate, and inserts elements from `[i, j)` into it.	Average case $\mathcal{O}(N)$ (N is `distance(i, j)`), worst case $\mathcal{O}(N^2)$
`X(il)`	`X`	Same as `X(il.begin(), il.end())`.	Same as `X(il.begin(), il.end())`.
`X(il, n)`	`X`	Same as `X(il.begin(), il.end(), n)`.	Same as `X(il.begin(), il.end(), n)`.
`X(il, n, hf)`	`X`	Same as `X(il.begin(), il.end(), n, hf)`.	Same as `X(il.begin(), il.end(), n, hf)`.
`X(il, n, hf, eq)`	`X`	Same as `X(il.begin(), il.end(), n, hf, eq)`.	Same as `X(il.begin(), il.end(), n, hf, eq)`.
`X(b)` `X a(b);`	`X`	Copy constructor. In addition to the requirements of Table 73, copies the hash function, predicate, and maximum load factor.	Average case linear in `b.size()`, worst case quadratic.
`a = b`	`X&`	Copy assignment operator. In addition to the requirements of Table 73, copies the hash function, predicate, and maximum load factor.	Average case linear in `b.size()`, worst case quadratic.

Table 81: Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a = il`	`X&`	*Preconditions*: `value_type` is *Cpp17CopyInsertable* into `X` and *Cpp17CopyAssignable*. *Effects*: Assigns the range `[il.begin(), il.end())` into `a`. All existing elements of `a` are either assigned to or destroyed.	Same as `a = X(il)`.
`b.hash_function()`	`hasher`	*Returns*: `b`'s hash function.	constant
`b.key_eq()`	`key_equal`	*Returns*: `b`'s key equality predicate.	constant
`a_uniq.emplace(args)`	`pair<iterator, bool>`	*Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`. *Effects*: Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` if and only if there is no element in the container with key equivalent to the key of `t`. The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of `t`.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a_uniq.size()`$)$.
`a_eq.emplace(args)`	`iterator`	*Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`. *Effects*: Inserts a `value_type` object `t` constructed with `std::forward<Args>(args)...` and returns the iterator pointing to the newly inserted element.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a_eq.size()`$)$.
`a.emplace_hint(p, args)`	`iterator`	*Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `args`. *Effects*: Equivalent to `a.emplace( std::forward< Args>(args)...)`. Return value is an iterator pointing to the element with the key equivalent to the newly inserted element. The `const_iterator p` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.

Table 81: Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a_uniq.insert(t)`	`pair<iterator, bool>`	*Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`. *Effects*: Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`. The `bool` component of the returned pair indicates whether the insertion takes place, and the `iterator` component points to the element with key equivalent to the key of `t`.	Average case $\mathscr{O}(1)$, worst case $\mathscr{O}($`a_uniq.size()`$)$.
`a_eq.insert(t)`	`iterator`	*Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`. *Effects*: Inserts `t`, and returns an iterator pointing to the newly inserted element.	Average case $\mathscr{O}(1)$, worst case $\mathscr{O}($`a_eq.size()`$)$.
`a.insert(p, t)`	`iterator`	*Preconditions*: If `t` is a non-const rvalue, `value_type` is *Cpp17MoveInsertable* into `X`; otherwise, `value_type` is *Cpp17CopyInsertable* into `X`. *Effects*: Equivalent to `a.insert(t)`. Return value is an iterator pointing to the element with the key equivalent to that of `t`. The iterator `p` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.	Average case $\mathscr{O}(1)$, worst case $\mathscr{O}($`a.size()`$)$.
`a.insert(i, j)`	`void`	*Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `X` from `*i`. Neither `i` nor `j` are iterators into `a`. *Effects*: Equivalent to `a.insert(t)` for each element in `[i,j)`.	Average case $\mathscr{O}(N)$, where N is `distance(i, j)`, worst case $\mathscr{O}(N($`a.size()`$+1))$.
`a.insert(il)`	`void`	Same as `a.insert(il.begin(), il.end())`.	Same as `a.insert( il.begin(), il.end())`.

Table 81: Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a_uniq.insert(nh)`	`insert_return_type`	*Preconditions*: `nh` is empty or `a_uniq.get_allocator() == nh.get_allocator()`. *Effects*: If `nh` is empty, has no effect. Otherwise, inserts the element owned by `nh` if and only if there is no element in the container with a key equivalent to `nh.key()`. *Postconditions*: If `nh` is empty, `inserted` is `false`, `position` is `end()`, and `node` is empty. Otherwise if the insertion took place, `inserted` is `true`, `position` points to the inserted element, and `node` is empty; if the insertion failed, `inserted` is `false`, `node` has the previous value of `nh`, and `position` points to an element with a key equivalent to `nh.key()`.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a_uniq.size()`$)$.
`a_eq.insert(nh)`	`iterator`	*Preconditions*: `nh` is empty or `a_eq.get_allocator() == nh.get_allocator()`. *Effects*: If `nh` is empty, has no effect and returns `a_eq.end()`. Otherwise, inserts the element owned by `nh` and returns an iterator pointing to the newly inserted element. *Postconditions*: `nh` is empty.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a_eq.size()`$)$.
`a.insert(q, nh)`	`iterator`	*Preconditions*: `nh` is empty or `a.get_allocator() == nh.get_allocator()`. *Effects*: If `nh` is empty, has no effect and returns `a.end()`. Otherwise, inserts the element owned by `nh` if and only if there is no element with key equivalent to `nh.key()` in containers with unique keys; always inserts the element owned by `nh` in containers with equivalent keys. Always returns the iterator pointing to the element with key equivalent to `nh.key()`. The iterator `q` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint. *Postconditions*: `nh` is empty if insertion succeeds, unchanged if insertion fails.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.

Table 81: Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a.extract(k)`	`node_type`	*Effects*: Removes an element in the container with key equivalent to `k`. *Returns*: A `node_type` owning the element if found, otherwise an empty `node_type`.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.
`a.extract(q)`	`node_type`	*Effects*: Removes the element pointed to by `q`. *Returns*: A `node_type` owning that element.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.
`a.merge(a2)`	`void`	*Preconditions*: `a.get_allocator() == a2.get_allocator()`. Attempts to extract each element in `a2` and insert it into `a` using the hash function and key equality predicate of `a`. In containers with unique keys, if there is an element in `a` with key equivalent to the key of an element from `a2`, then that element is not extracted from `a2`. *Postconditions*: Pointers and references to the transferred elements of `a2` refer to those same elements but as members of `a`. Iterators referring to the transferred elements and all iterators referring to `a` will be invalidated, but iterators to elements remaining in `a2` will remain valid.	Average case $\mathcal{O}(N)$, where N is `a2.size()`, worst case $\mathcal{O}(N$`*a.size()`$+N)$.
`a.erase(k)`	`size_type`	*Effects*: Erases all elements with key equivalent to `k`. *Returns*: The number of elements erased.	Average case $\mathcal{O}($`a.count(k)`$)$, worst case $\mathcal{O}($`a.size()`$)$.
`a.erase(q)`	`iterator`	*Effects*: Erases the element pointed to by `q`. *Returns*: The iterator immediately following `q` prior to the erasure.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.
`a.erase(r)`	`iterator`	*Effects*: Erases the element pointed to by `r`. *Returns*: The iterator immediately following `r` prior to the erasure.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}($`a.size()`$)$.
`a.erase(q1, q2)`	`iterator`	*Effects*: Erases all elements in the range `[q1, q2)`. *Returns*: The iterator immediately following the erased elements prior to the erasure.	Average case linear in `distance(q1, q2)`, worst case $\mathcal{O}($`a.size()`$)$.

Table 81: Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a.clear()`	`void`	*Effects*: Erases all elements in the container. *Postconditions*: `a.empty()` is `true`	Linear in `a.size()`.
`b.find(k)`	`iterator`; `const_iterator` for const `b`.	*Returns*: An iterator pointing to an element with key equivalent to `k`, or `b.end()` if no such element exists.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(\texttt{b.size()})$.
`a_tran.find(ke)`	`iterator`; `const_iterator` for const `a_tran`.	*Returns*: An iterator pointing to an element with key equivalent to `ke`, or `a_tran.end()` if no such element exists.	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(\texttt{a\_tran.size()})$.
`b.count(k)`	`size_type`	*Returns*: The number of elements with key equivalent to `k`.	Average case $\mathcal{O}(\texttt{b.count(k)})$, worst case $\mathcal{O}(\texttt{b.size()})$.
`a_tran.count(ke)`	`size_type`	*Returns*: The number of elements with key equivalent to `ke`.	Average case $\mathcal{O}(\texttt{a\_tran.count(ke)})$, worst case $\mathcal{O}(\texttt{a\_tran.size()})$.
`b.contains(k)`	`bool`	*Effects*: Equivalent to `b.find(k) != b.end()`	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(\texttt{b.size()})$.
`a_tran.contains(ke)`	`bool`	*Effects*: Equivalent to `a_tran.find(ke) != a_tran.end()`	Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(\texttt{a\_tran.size()})$.
`b.equal_range(k)`	pair<iterator, iterator>; pair<const_iterator, const_iterator> for const `b`.	*Returns*: A range containing all elements with keys equivalent to `k`. Returns `make_pair(b.end(), b.end())` if no such elements exist.	Average case $\mathcal{O}(\texttt{b.count(k)})$, worst case $\mathcal{O}(\texttt{b.size()})$.
`a_tran.equal_range(ke)`	pair<iterator, iterator>; pair<const_iterator, const_iterator> for const `a_tran`.	*Returns*: A range containing all elements with keys equivalent to `ke`. Returns `make_pair(a_tran.end(), a_tran.end())` if no such elements exist.	Average case $\mathcal{O}(\texttt{a\_tran.count(ke)})$, worst case $\mathcal{O}(\texttt{a\_tran.size()})$.
`b.bucket_count()`	`size_type`	*Returns*: The number of buckets that `b` contains.	Constant
`b.max_bucket_count()`	`size_type`	*Returns*: An upper bound on the number of buckets that `b` can ever contain.	Constant

Table 81: Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`b.bucket(k)`	`size_type`	*Preconditions*: `b.bucket_count() > 0`. *Returns*: The index of the bucket in which elements with keys equivalent to `k` would be found, if any such element existed. *Postconditions*: The return value shall be in the range `[0, b.bucket_count())`.	Constant
`b.bucket_size(n)`	`size_type`	*Preconditions*: `n` shall be in the range `[0, b.bucket_count())`. *Returns*: The number of elements in the $\texttt{n}^{\text{th}}$ bucket.	$\mathcal{O}$(`b.bucket_size(n)`)
`b.begin(n)`	`local_iterator`; `const_local_iterator` for const `b`.	*Preconditions*: `n` is in the range `[0, b.bucket_count())`. *Returns*: An iterator referring to the first element in the bucket. If the bucket is empty, then `b.begin(n) == b.end(n)`.	Constant
`b.end(n)`	`local_iterator`; `const_local_iterator` for const `b`.	*Preconditions*: `n` is in the range `[0, b.bucket_count())`. *Returns*: An iterator which is the past-the-end value for the bucket.	Constant
`b.cbegin(n)`	`const_local_iterator`	*Preconditions*: `n` shall be in the range `[0, b.bucket_count())`. *Returns*: An iterator referring to the first element in the bucket. If the bucket is empty, then `b.cbegin(n) == b.cend(n)`.	Constant
`b.cend(n)`	`const_local_iterator`	*Preconditions*: `n` is in the range `[0, b.bucket_count())`. *Returns*: An iterator which is the past-the-end value for the bucket.	Constant
`b.load_factor()`	`float`	*Returns*: The average number of elements per bucket.	Constant
`b.max_load_factor()`	`float`	*Returns*: A positive number that the container attempts to keep the load factor less than or equal to. The container automatically increases the number of buckets as necessary to keep the load factor below this number.	Constant
`a.max_load_factor(z)`	`void`	*Preconditions*: `z` is positive. May change the container's maximum load factor, using `z` as a hint.	Constant
`a.rehash(n)`	`void`	*Postconditions*: `a.bucket_count() >= a.size() / a.max_load_factor()` and `a.bucket_count() >= n`.	Average case linear in `a.size()`, worst case quadratic.

Table 81: Unordered associative container requirements (in addition to container) (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`a.reserve(n)`	`void`	Same as `a.rehash(ceil(n / a.max_load_factor()))`.	Average case linear in `a.size()`, worst case quadratic.

12 Two unordered containers `a` and `b` compare equal if `a.size() == b.size()` and, for every equivalent-key group `[Ea1, Ea2)` obtained from `a.equal_range(Ea1)`, there exists an equivalent-key group `[Eb1, Eb2)` obtained from `b.equal_range(Ea1)`, such that `is_permutation(Ea1, Ea2, Eb1, Eb2)` returns `true`. For `unordered_set` and `unordered_map`, the complexity of `operator==` (i.e., the number of calls to the `==` operator of the `value_type`, to the predicate returned by `key_eq()`, and to the hasher returned by `hash_function()`) is proportional to N in the average case and to N^2 in the worst case, where N is `a.size()`. For `unordered_multiset` and `unordered_multimap`, the complexity of `operator==` is proportional to $\sum E_i^2$ in the average case and to N^2 in the worst case, where N is `a.size()`, and E_i is the size of the i^{th} equivalent-key group in `a`. However, if the respective elements of each corresponding pair of equivalent-key groups Ea_i and Eb_i are arranged in the same order (as is commonly the case, e.g., if `a` and `b` are unmodified copies of the same container), then the average-case complexity for `unordered_multiset` and `unordered_multimap` becomes proportional to N (but worst-case complexity remains $\mathcal{O}(N^2)$, e.g., for a pathologically bad hash function). The behavior of a program that uses `operator==` or `operator!=` on unordered containers is undefined unless the `Pred` function object has the same behavior for both containers and the equality comparison function for `Key` is a refinement[230] of the partition into equivalent-key groups produced by `Pred`.

13 The iterator types `iterator` and `const_iterator` of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the key type and value type are the same, both `iterator` and `const_iterator` are constant iterators.

14 The `insert` and `emplace` members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The `erase` members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.

15 The `insert` and `emplace` members shall not affect the validity of iterators if `(N+n) <= z * B`, where `N` is the number of elements in the container prior to the insert operation, `n` is the number of elements inserted, `B` is the container's bucket count, and `z` is the container's maximum load factor.

16 The `extract` members invalidate only iterators to the removed element, and preserve the relative order of the elements that are not erased; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a `node_type` is undefined behavior. References and pointers to an element obtained while it is owned by a `node_type` are invalidated if the element is successfully inserted.

17 The member function templates `find`, `count`, `equal_range`, and `contains` shall not participate in overload resolution unless the *qualified-id*s `Pred::is_transparent` and `Hash::is_transparent` are both valid and denote types (13.10.3).

18 A deduction guide for an unordered associative container shall not participate in overload resolution if any of the following are true:

(18.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(18.2) — It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

(18.3) — It has a `Hash` template parameter and an integral type or a type that qualifies as an allocator is deduced for that parameter.

(18.4) — It has a `Pred` template parameter and a type that qualifies as an allocator is deduced for that parameter.

230) Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.

22.2.7.2 Exception safety guarantees [unord.req.except]

1 For unordered associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's `Hash` or `Pred` object (if any).

2 For unordered associative containers, if an exception is thrown by any operation other than the container's hash function from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.

3 For unordered associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's `Hash` or `Pred` object (if any).

4 For unordered associative containers, if an exception is thrown from within a `rehash()` function other than by the container's hash function or comparison function, the `rehash()` function has no effect.

22.3 Sequence containers [sequences]

22.3.1 In general [sequences.general]

1 The headers `<array>` (22.3.2), `<deque>` (22.3.3), `<forward_list>` (22.3.4), `<list>` (22.3.5), and `<vector>` (22.3.6) define class templates that meet the requirements for sequence containers.

2 The following exposition-only alias template may appear in deduction guides for sequence containers:

```
template<class InputIterator>
  using iter-value-type = typename iterator_traits<InputIterator>::value_type;   // exposition only
```

22.3.2 Header `<array>` synopsis [array.syn]

```
#include <compare>              // see 17.11.1
#include <initializer_list>     // see 17.10.2

namespace std {
  // 22.3.7, class template array
  template<class T, size_t N> struct array;

  template<class T, size_t N>
    constexpr bool operator==(const array<T, N>& x, const array<T, N>& y);
  template<class T, size_t N>
    constexpr synth-three-way-result<T>
      operator<=>(const array<T, N>& x, const array<T, N>& y);

  // 22.3.7.4, specialized algorithms
  template<class T, size_t N>
    constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));

  // 22.3.7.6, array creation functions
  template<class T, size_t N>
    constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
  template<class T, size_t N>
    constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);

  // 22.3.7.7, tuple interface
  template<class T> struct tuple_size;
  template<size_t I, class T> struct tuple_element;
  template<class T, size_t N>
    struct tuple_size<array<T, N>>;
  template<size_t I, class T, size_t N>
    struct tuple_element<I, array<T, N>>;
  template<size_t I, class T, size_t N>
    constexpr T& get(array<T, N>&) noexcept;
  template<size_t I, class T, size_t N>
    constexpr T&& get(array<T, N>&&) noexcept;
  template<size_t I, class T, size_t N>
    constexpr const T& get(const array<T, N>&) noexcept;
  template<size_t I, class T, size_t N>
    constexpr const T&& get(const array<T, N>&&) noexcept;
}
```

22.3.3 Header <deque> synopsis [deque.syn]

```
#include <compare>              // see 17.11.1
#include <initializer_list>     // see 17.10.2

namespace std {
  // 22.3.8, class template deque
  template<class T, class Allocator = allocator<T>> class deque;

  template<class T, class Allocator>
    bool operator==(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
  template<class T, class Allocator>
    synth-three-way-result<T> operator<=>(const deque<T, Allocator>& x,
                                          const deque<T, Allocator>& y);

  template<class T, class Allocator>
    void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
      noexcept(noexcept(x.swap(y)));

  template<class T, class Allocator, class U>
    typename deque<T, Allocator>::size_type
      erase(deque<T, Allocator>& c, const U& value);
  template<class T, class Allocator, class Predicate>
    typename deque<T, Allocator>::size_type
      erase_if(deque<T, Allocator>& c, Predicate pred);

  namespace pmr {
    template<class T>
      using deque = std::deque<T, polymorphic_allocator<T>>;
  }
}
```

22.3.4 Header <forward_list> synopsis [forward.list.syn]

```
#include <compare>              // see 17.11.1
#include <initializer_list>     // see 17.10.2

namespace std {
  // 22.3.9, class template forward_list
  template<class T, class Allocator = allocator<T>> class forward_list;

  template<class T, class Allocator>
    bool operator==(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
  template<class T, class Allocator>
    synth-three-way-result<T> operator<=>(const forward_list<T, Allocator>& x,
                                          const forward_list<T, Allocator>& y);

  template<class T, class Allocator>
    void swap(forward_list<T, Allocator>& x, forward_list<T, Allocator>& y)
      noexcept(noexcept(x.swap(y)));

  template<class T, class Allocator, class U>
    typename forward_list<T, Allocator>::size_type
      erase(forward_list<T, Allocator>& c, const U& value);
  template<class T, class Allocator, class Predicate>
    typename forward_list<T, Allocator>::size_type
      erase_if(forward_list<T, Allocator>& c, Predicate pred);

  namespace pmr {

    }
  }
```

22.3.7 Class template array [array]

22.3.7.1 Overview [array.overview]

1 The header `<array>` defines a class template for storing fixed-size sequences of objects. An `array` is a contiguous container (22.2.1). An instance of `array<T, N>` stores `N` elements of type `T`, so that `size() == N` is an invariant.

2 An `array` is an aggregate (9.4.2) that can be list-initialized with up to `N` elements whose types are convertible to `T`.

3 An `array` meets all of the requirements of a container and of a reversible container (22.2), except that a default constructed `array` object is not empty and that `swap` does not have constant complexity. An `array` meets some of the requirements of a sequence container (22.2.3). Descriptions are provided here only for operations on `array` that are not described in one of these tables and for operations where there is additional semantic information.

4 `array<T, N>` is a structural type (13.2) if `T` is a structural type. Two values `a1` and `a2` of type `array<T, N>` are template-argument-equivalent (13.6) if and only if each pair of corresponding elements in `a1` and `a2` are template-argument-equivalent.

5 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (23.3.1).

```
namespace std {
  template<class T, size_t N>
  struct array {
    // types
    using value_type             = T;
    using pointer                = T*;
    using const_pointer          = const T*;
    using reference              = T&;
    using const_reference        = const T&;
    using size_type              = size_t;
    using difference_type        = ptrdiff_t;
    using iterator               = implementation-defined; // see 22.2
    using const_iterator         = implementation-defined; // see 22.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // no explicit construct/copy/destroy for aggregate type

    constexpr void fill(const T& u);
    constexpr void swap(array&) noexcept(is_nothrow_swappable_v<T>);

    // iterators
    constexpr iterator               begin() noexcept;
    constexpr const_iterator         begin() const noexcept;
    constexpr iterator               end() noexcept;
    constexpr const_iterator         end() const noexcept;

    constexpr reverse_iterator       rbegin() noexcept;
    constexpr const_reverse_iterator rbegin() const noexcept;
    constexpr reverse_iterator       rend() noexcept;
    constexpr const_reverse_iterator rend() const noexcept;

    constexpr const_iterator         cbegin() const noexcept;
    constexpr const_iterator         cend() const noexcept;
    constexpr const_reverse_iterator crbegin() const noexcept;
    constexpr const_reverse_iterator crend() const noexcept;
```

```
    // capacity
    [[nodiscard]] constexpr bool empty() const noexcept;
    constexpr size_type size() const noexcept;
    constexpr size_type max_size() const noexcept;

    // element access
    constexpr reference       operator[](size_type n);
    constexpr const_reference operator[](size_type n) const;
    constexpr reference       at(size_type n);
    constexpr const_reference at(size_type n) const;
    constexpr reference       front();
    constexpr const_reference front() const;
    constexpr reference       back();
    constexpr const_reference back() const;

    constexpr T *       data() noexcept;
    constexpr const T * data() const noexcept;
  };

  template<class T, class... U>
    array(T, U...) -> array<T, 1 + sizeof...(U)>;
}
```

22.3.7.2 Constructors, copy, and assignment [array.cons]

1 The conditions for an aggregate (9.4.2) shall be met. Class `array` relies on the implicitly-declared special member functions (11.4.5.2, 11.4.7, and 11.4.5.3) to conform to the container requirements table in 22.2. In addition to the requirements specified in the container requirements table, the implicit move constructor and move assignment operator for `array` require that `T` be *Cpp17MoveConstructible* or *Cpp17MoveAssignable*, respectively.

```
template<class T, class... U>
  array(T, U...) -> array<T, 1 + sizeof...(U)>;
```

2 *Mandates*: `(is_same_v<T, U> && ...)` is `true`.

22.3.7.3 Member functions [array.members]

```
constexpr size_type size() const noexcept;
```

1 *Returns*: `N`.

```
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

2 *Returns*: A pointer such that `[data(), data() + size())` is a valid range. For a non-empty array, `data() == addressof(front())`.

```
constexpr void fill(const T& u);
```

3 *Effects*: As if by `fill_n(begin(), N, u)`.

```
constexpr void swap(array& y) noexcept(is_nothrow_swappable_v<T>);
```

4 *Effects*: Equivalent to `swap_ranges(begin(), end(), y.begin())`.

5 [*Note 1*: Unlike the `swap` function for other containers, `array::swap` takes linear time, can exit via an exception, and does not cause iterators to become associated with the other container. — *end note*]

22.3.7.4 Specialized algorithms [array.special]

```
template<class T, size_t N>
  constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints*: `N == 0` or `is_swappable_v<T>` is `true`.

2 *Effects*: As if by `x.swap(y)`.

3 *Complexity*: Linear in `N`.

22.3.7.5 Zero-sized arrays [array.zero]

1 `array` shall provide support for the special case `N == 0`.

2 In the case that `N == 0`, `begin() == end() ==` unique value. The return value of `data()` is unspecified.

3 The effect of calling `front()` or `back()` for a zero-sized array is undefined.

4 Member function `swap()` shall have a non-throwing exception specification.

22.3.7.6 Array creation functions [array.creation]

```
template<class T, size_t N>
  constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
```

1 *Mandates*: `is_array_v<T>` is `false` and `is_constructible_v<T, T&>` is `true`.

2 *Preconditions*: `T` meets the *Cpp17CopyConstructible* requirements.

3 *Returns*: `{{ a[0], ..., a[N - 1] }}`.

```
template<class T, size_t N>
  constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);
```

4 *Mandates*: `is_array_v<T>` is `false` and `is_move_constructible_v<T>` is `true`.

5 *Preconditions*: `T` meets the *Cpp17MoveConstructible* requirements.

6 *Returns*: `{{ std::move(a[0]), ..., std::move(a[N - 1]) }}`.

22.3.7.7 Tuple interface [array.tuple]

```
template<class T, size_t N>
  struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };

template<size_t I, class T, size_t N>
  struct tuple_element<I, array<T, N>> {
    using type = T;
  };
```

1 *Mandates*: `I < N` is `true`.

```
template<size_t I, class T, size_t N>
  constexpr T& get(array<T, N>& a) noexcept;
template<size_t I, class T, size_t N>
  constexpr T&& get(array<T, N>&& a) noexcept;
template<size_t I, class T, size_t N>
  constexpr const T& get(const array<T, N>& a) noexcept;
template<size_t I, class T, size_t N>
  constexpr const T&& get(const array<T, N>&& a) noexcept;
```

2 *Mandates*: `I < N` is `true`.

3 *Returns*: A reference to the $\texttt{I}^{\text{th}}$ element of `a`, where indexing is zero-based.

22.3.8 Class template deque [deque]

22.3.8.1 Overview [deque.overview]

1 A `deque` is a sequence container that supports random access iterators (23.3.5.7). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a deque is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.

2 A `deque` meets all of the requirements of a container, of a reversible container (given in tables in 22.2), of a sequence container, including the optional sequence container requirements (22.2.3), and of an allocator-aware container (Table 76). Descriptions are provided here only for operations on `deque` that are not described in one of these tables or for operations where there is additional semantic information.

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class deque {
  public:
    // types
```

```
    using value_type             = T;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 22.2
    using difference_type        = implementation-defined; // see 22.2
    using iterator               = implementation-defined; // see 22.2
    using const_iterator         = implementation-defined; // see 22.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // 22.3.8.2, construct/copy/destroy
    deque() : deque(Allocator()) { }
    explicit deque(const Allocator&);
    explicit deque(size_type n, const Allocator& = Allocator());
    deque(size_type n, const T& value, const Allocator& = Allocator());
    template<class InputIterator>
      deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
    deque(const deque& x);
    deque(deque&&);
    deque(const deque&, const Allocator&);
    deque(deque&&, const Allocator&);
    deque(initializer_list<T>, const Allocator& = Allocator());

    ~deque();
    deque& operator=(const deque& x);
    deque& operator=(deque&& x)
      noexcept(allocator_traits<Allocator>::is_always_equal::value);
    deque& operator=(initializer_list<T>);
    template<class InputIterator>
      void assign(InputIterator first, InputIterator last);
    void assign(size_type n, const T& t);
    void assign(initializer_list<T>);
    allocator_type get_allocator() const noexcept;

    // iterators
    iterator               begin() noexcept;
    const_iterator         begin() const noexcept;
    iterator               end() noexcept;
    const_iterator         end() const noexcept;
    reverse_iterator       rbegin() noexcept;
    const_reverse_iterator rbegin() const noexcept;
    reverse_iterator       rend() noexcept;
    const_reverse_iterator rend() const noexcept;

    const_iterator         cbegin() const noexcept;
    const_iterator         cend() const noexcept;
    const_reverse_iterator crbegin() const noexcept;
    const_reverse_iterator crend() const noexcept;

    // 22.3.8.3, capacity
    [[nodiscard]] bool empty() const noexcept;
    size_type size() const noexcept;
    size_type max_size() const noexcept;
    void      resize(size_type sz);
    void      resize(size_type sz, const T& c);
    void      shrink_to_fit();

    // element access
    reference       operator[](size_type n);
    const_reference operator[](size_type n) const;
    reference       at(size_type n);
```

```
    const_reference at(size_type n) const;
    reference       front();
    const_reference front() const;
    reference       back();
    const_reference back() const;

    // 22.3.8.4, modifiers
    template<class... Args> reference emplace_front(Args&&... args);
    template<class... Args> reference emplace_back(Args&&... args);
    template<class... Args> iterator emplace(const_iterator position, Args&&... args);

    void push_front(const T& x);
    void push_front(T&& x);
    void push_back(const T& x);
    void push_back(T&& x);

    iterator insert(const_iterator position, const T& x);
    iterator insert(const_iterator position, T&& x);
    iterator insert(const_iterator position, size_type n, const T& x);
    template<class InputIterator>
      iterator insert(const_iterator position, InputIterator first, InputIterator last);
    iterator insert(const_iterator position, initializer_list<T>);

    void pop_front();
    void pop_back();

    iterator erase(const_iterator position);
    iterator erase(const_iterator first, const_iterator last);
    void     swap(deque&)
      noexcept(allocator_traits<Allocator>::is_always_equal::value);
    void     clear() noexcept;
  };

  template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
    deque(InputIterator, InputIterator, Allocator = Allocator())
      -> deque<iter-value-type<InputIterator>, Allocator>;

  // swap
  template<class T, class Allocator>
    void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
      noexcept(noexcept(x.swap(y)));
}
```

22.3.8.2 Constructors, copy, and assignment [deque.cons]

`explicit deque(const Allocator&);`

1 *Effects*: Constructs an empty `deque`, using the specified allocator.

2 *Complexity*: Constant.

`explicit deque(size_type n, const Allocator& = Allocator());`

3 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `*this`.

4 *Effects*: Constructs a `deque` with `n` default-inserted elements using the specified allocator.

5 *Complexity*: Linear in `n`.

`deque(size_type n, const T& value, const Allocator& = Allocator());`

6 *Preconditions*: `T` is *Cpp17CopyInsertable* into `*this`.

7 *Effects*: Constructs a `deque` with `n` copies of `value`, using the specified allocator.

8 *Complexity*: Linear in `n`.

```
template<class InputIterator>
  deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects*: Constructs a `deque` equal to the range `[first, last)`, using the specified allocator.

10 *Complexity*: Linear in `distance(first, last)`.

22.3.8.3 Capacity [deque.capacity]

```
void resize(size_type sz);
```

1 *Preconditions*: `T` is *Cpp17MoveInsertable* and *Cpp17DefaultInsertable* into `*this`.

2 *Effects*: If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` default-inserted elements to the sequence.

```
void resize(size_type sz, const T& c);
```

3 *Preconditions*: `T` is *Cpp17CopyInsertable* into `*this`.

4 *Effects*: If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` copies of `c` to the sequence.

```
void shrink_to_fit();
```

5 *Preconditions*: `T` is *Cpp17MoveInsertable* into `*this`.

6 *Effects*: `shrink_to_fit` is a non-binding request to reduce memory use but does not change the size of the sequence.

[*Note 1*: The request is non-binding to allow latitude for implementation-specific optimizations. — *end note*]

If the size is equal to the old capacity, or if an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* `T`, then there are no effects.

7 *Complexity*: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

8 *Remarks*: If the size is not equal to the old capacity, then invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

22.3.8.4 Modifiers [deque.modifiers]

```
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  iterator insert(const_iterator position,
                  InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);
```

1 *Effects*: An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.

2 *Complexity*: The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element at either the beginning or end of a deque always takes constant time and causes a single call to a constructor of `T`.

3 *Remarks*: If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of `T` there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-*Cpp17CopyInsertable* `T`, the effects are unspecified.

```
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();
```

4 *Effects*: An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque.

[*Note 1*: `pop_front` and `pop_back` are erase operations. — *end note*]

5 *Throws*: Nothing unless an exception is thrown by the assignment operator of `T`.

6 *Complexity*: The number of calls to the destructor of `T` is the same as the number of elements erased, but the number of calls to the assignment operator of `T` is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.

22.3.8.5 Erasure [deque.erasure]

```
template<class T, class Allocator, class U>
  typename deque<T, Allocator>::size_type
    erase(deque<T, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class T, class Allocator, class Predicate>
  typename deque<T, Allocator>::size_type
    erase_if(deque<T, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

22.3.9 Class template `forward_list` [forwardlist]

22.3.9.1 Overview [forwardlist.overview]

1 A `forward_list` is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported.

[*Note 1*: It is intended that `forward_list` have zero space or time overhead relative to a hand-written C-style singly linked list. Features that would conflict with that goal have been omitted. — *end note*]

2 A `forward_list` meets all of the requirements of a container (Table 73), except that the `size()` member function is not provided and `operator==` has linear complexity. A `forward_list` also meets all of the requirements for an allocator-aware container (Table 76). In addition, a `forward_list` provides the `assign` member functions (Table 77) and several of the optional container requirements (Table 78). Descriptions are provided here only for operations on `forward_list` that are not described in that table or for operations where there is additional semantic information.

3 [*Note 2*: Modifying any list requires access to the element preceding the first element of interest, but in a `forward_list` there is no constant-time way to access a preceding element. For this reason, `erase_after` and `splice_after` take fully-open ranges, not semi-open ranges. — *end note*]

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class forward_list {
  public:
    // types
    using value_type      = T;
```

```
using allocator_type  = Allocator;
using pointer         = typename allocator_traits<Allocator>::pointer;
using const_pointer   = typename allocator_traits<Allocator>::const_pointer;
using reference       = value_type&;
using const_reference = const value_type&;
using size_type       = implementation-defined; // see 22.2
using difference_type = implementation-defined; // see 22.2
using iterator        = implementation-defined; // see 22.2
using const_iterator  = implementation-defined; // see 22.2

// 22.3.9.2, construct/copy/destroy
forward_list() : forward_list(Allocator()) { }
explicit forward_list(const Allocator&);
explicit forward_list(size_type n, const Allocator& = Allocator());
forward_list(size_type n, const T& value, const Allocator& = Allocator());
template<class InputIterator>
  forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
forward_list(const forward_list& x);
forward_list(forward_list&& x);
forward_list(const forward_list& x, const Allocator&);
forward_list(forward_list&& x, const Allocator&);
forward_list(initializer_list<T>, const Allocator& = Allocator());
~forward_list();
forward_list& operator=(const forward_list& x);
forward_list& operator=(forward_list&& x)
  noexcept(allocator_traits<Allocator>::is_always_equal::value);
forward_list& operator=(initializer_list<T>);
template<class InputIterator>
  void assign(InputIterator first, InputIterator last);
void assign(size_type n, const T& t);
void assign(initializer_list<T>);
allocator_type get_allocator() const noexcept;

// 22.3.9.3, iterators
iterator before_begin() noexcept;
const_iterator before_begin() const noexcept;
iterator begin() noexcept;
const_iterator begin() const noexcept;
iterator end() noexcept;
const_iterator end() const noexcept;

const_iterator cbegin() const noexcept;
const_iterator cbefore_begin() const noexcept;
const_iterator cend() const noexcept;

// capacity
[[nodiscard]] bool empty() const noexcept;
size_type max_size() const noexcept;

// 22.3.9.4, element access
reference front();
const_reference front() const;

// 22.3.9.5, modifiers
template<class... Args> reference emplace_front(Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void pop_front();

template<class... Args> iterator emplace_after(const_iterator position, Args&&... args);
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);
```

```
    iterator insert_after(const_iterator position, size_type n, const T& x);
    template<class InputIterator>
      iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
    iterator insert_after(const_iterator position, initializer_list<T> il);

    iterator erase_after(const_iterator position);
    iterator erase_after(const_iterator position, const_iterator last);
    void swap(forward_list&)
      noexcept(allocator_traits<Allocator>::is_always_equal::value);

    void resize(size_type sz);
    void resize(size_type sz, const value_type& c);
    void clear() noexcept;

    // 22.3.9.6, forward_list operations
    void splice_after(const_iterator position, forward_list& x);
    void splice_after(const_iterator position, forward_list&& x);
    void splice_after(const_iterator position, forward_list& x, const_iterator i);
    void splice_after(const_iterator position, forward_list&& x, const_iterator i);
    void splice_after(const_iterator position, forward_list& x,
                      const_iterator first, const_iterator last);
    void splice_after(const_iterator position, forward_list&& x,
                      const_iterator first, const_iterator last);

    size_type remove(const T& value);
    template<class Predicate> size_type remove_if(Predicate pred);

    size_type unique();
    template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);

    void merge(forward_list& x);
    void merge(forward_list&& x);
    template<class Compare> void merge(forward_list& x, Compare comp);
    template<class Compare> void merge(forward_list&& x, Compare comp);

    void sort();
    template<class Compare> void sort(Compare comp);

    void reverse() noexcept;
  };

  template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
    forward_list(InputIterator, InputIterator, Allocator = Allocator())
      -> forward_list<iter-value-type<InputIterator>, Allocator>;

  // swap
  template<class T, class Allocator>
    void swap(forward_list<T, Allocator>& x, forward_list<T, Allocator>& y)
      noexcept(noexcept(x.swap(y)));
}
```

4 An incomplete type `T` may be used when instantiating `forward_list` if the allocator meets the allocator completeness requirements (16.4.4.6.2). `T` shall be complete before any member of the resulting specialization of `forward_list` is referenced.

22.3.9.2 Constructors, copy, and assignment [forwardlist.cons]

```
explicit forward_list(const Allocator&);
```

1 *Effects*: Constructs an empty `forward_list` object using the specified allocator.

2 *Complexity*: Constant.

```
explicit forward_list(size_type n, const Allocator& = Allocator());
```

3 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `*this`.

4 *Effects*: Constructs a `forward_list` object with `n` default-inserted elements using the specified allocator.

5 *Complexity*: Linear in `n`.

```
forward_list(size_type n, const T& value, const Allocator& = Allocator());
```

6 *Preconditions*: `T` is *Cpp17CopyInsertable* into `*this`.

7 *Effects*: Constructs a `forward_list` object with `n` copies of `value` using the specified allocator.

8 *Complexity*: Linear in `n`.

```
template<class InputIterator>
  forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects*: Constructs a `forward_list` object equal to the range `[first, last)`.

10 *Complexity*: Linear in `distance(first, last)`.

22.3.9.3 Iterators [forwardlist.iter]

```
iterator before_begin() noexcept;
const_iterator before_begin() const noexcept;
const_iterator cbefore_begin() const noexcept;
```

1 *Effects*: `cbefore_begin()` is equivalent to `const_cast<forward_list const&>(*this).before_begin()`.

2 *Returns*: A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by `begin()`.

3 *Remarks*: `before_begin() == end()` shall equal `false`.

22.3.9.4 Element access [forwardlist.access]

```
reference front();
const_reference front() const;
```

1 *Returns*: `*begin()`

22.3.9.5 Modifiers [forwardlist.modifiers]

1 None of the overloads of `insert_after` shall affect the validity of iterators and references, and `erase_after` shall invalidate only iterators and references to the erased elements. If an exception is thrown during `insert_after` there shall be no effect. Inserting `n` elements into a `forward_list` is linear in `n`, and the number of calls to the copy or move constructor of `T` is exactly equal to `n`. Erasing `n` elements from a `forward_list` is linear in `n` and the number of calls to the destructor of type `T` is exactly equal to `n`.

```
template<class... Args> reference emplace_front(Args&&... args);
```

2 *Effects*: Inserts an object of type `value_type` constructed with `value_type(std::forward<Args>(args)...)` at the beginning of the list.

```
void push_front(const T& x);
void push_front(T&& x);
```

3 *Effects*: Inserts a copy of `x` at the beginning of the list.

```
void pop_front();
```

4 *Effects*: As if by `erase_after(before_begin())`.

```
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);
```

5 *Preconditions*: `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

6 *Effects*: Inserts a copy of `x` after `position`.

7 *Returns*: An iterator pointing to the copy of `x`.

```
iterator insert_after(const_iterator position, size_type n, const T& x);
```

8 *Preconditions*: `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

9 *Effects*: Inserts `n` copies of `x` after `position`.

10 *Returns*: An iterator pointing to the last inserted copy of `x` or `position` if `n == 0`.

```
template<class InputIterator>
  iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
```

11 *Preconditions*: `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. Neither `first` nor `last` are iterators in `*this`.

12 *Effects*: Inserts copies of elements in `[first, last)` after `position`.

13 *Returns*: An iterator pointing to the last inserted element or `position` if `first == last`.

```
iterator insert_after(const_iterator position, initializer_list<T> il);
```

14 *Effects*: `insert_after(p, il.begin(), il.end())`.

15 *Returns*: An iterator pointing to the last inserted element or `position` if `il` is empty.

```
template<class... Args>
  iterator emplace_after(const_iterator position, Args&&... args);
```

16 *Preconditions*: `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

17 *Effects*: Inserts an object of type `value_type` constructed with value_type(std::forward<Args>(args)...) after `position`.

18 *Returns*: An iterator pointing to the new object.

```
iterator erase_after(const_iterator position);
```

19 *Preconditions*: The iterator following `position` is dereferenceable.

20 *Effects*: Erases the element pointed to by the iterator following `position`.

21 *Returns*: An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

22 *Throws*: Nothing.

```
iterator erase_after(const_iterator position, const_iterator last);
```

23 *Preconditions*: All iterators in the range `(position, last)` are dereferenceable.

24 *Effects*: Erases the elements in the range `(position, last)`.

25 *Returns*: `last`.

26 *Throws*: Nothing.

```
void resize(size_type sz);
```

27 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `*this`.

28 *Effects*: If `sz < distance(begin(), end())`, erases the last `distance(begin(), end()) - sz` elements from the list. Otherwise, inserts `sz - distance(begin(), end())` default-inserted elements at the end of the list.

```
void resize(size_type sz, const value_type& c);
```

29 *Preconditions*: `T` is *Cpp17CopyInsertable* into `*this`.

30 *Effects*: If `sz < distance(begin(), end())`, erases the last `distance(begin(), end()) - sz` elements from the list. Otherwise, inserts `sz - distance(begin(), end())` copies of `c` at the end of the list.

```
void clear() noexcept;
```

31 *Effects*: Erases all elements in the range `[begin(), end())`.

32 *Remarks*: Does not invalidate past-the-end iterators.

22.3.9.6 Operations [forwardlist.ops]

1 In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall meet the corresponding requirements in 25.2. For `merge` and `sort`, the definitions and requirements in 25.8 apply.

```
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);
```

2 *Preconditions*: `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. `get_allocator() == x.get_allocator()` is `true`. `addressof(x) != this` is `true`.

3 *Effects*: Inserts the contents of `x` after `position`, and `x` becomes empty. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

4 *Throws*: Nothing.

5 *Complexity*: $\mathcal{O}$(`distance(x.begin(), x.end())`)

```
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);
```

6 *Preconditions*: `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. The iterator following `i` is a dereferenceable iterator in `x`. `get_allocator() == x.get_allocator()` is `true`.

7 *Effects*: Inserts the element following `i` into `*this`, following `position`, and removes it from `x`. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `*++i` continue to refer to the same element but as a member of `*this`. Iterators to `*++i` continue to refer to the same element, but now behave as iterators into `*this`, not into `x`.

8 *Throws*: Nothing.

9 *Complexity*: $\mathcal{O}(1)$

```
void splice_after(const_iterator position, forward_list& x,
                  const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
                  const_iterator first, const_iterator last);
```

10 *Preconditions*: `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. `(first, last)` is a valid range in `x`, and all iterators in the range `(first, last)` are dereferenceable. `position` is not an iterator in the range `(first, last)`. `get_allocator() == x.get_allocator()` is `true`.

11 *Effects*: Inserts elements in the range `(first, last)` after `position` and removes the elements from `x`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

12 *Complexity*: $\mathcal{O}$(`distance(first, last)`)

```
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
```

13 *Effects*: Erases all the elements in the list referred to by a list iterator `i` for which the following conditions hold: `*i == value` (for `remove()`), `pred(*i)` is `true` (for `remove_if()`). Invalidates only the iterators and references to the erased elements.

14 *Returns*: The number of elements erased.

15 *Throws*: Nothing unless an exception is thrown by the equality comparison or the predicate.

16 *Complexity*: Exactly `distance(begin(), end())` applications of the corresponding predicate.

17 *Remarks*: Stable (16.4.6.8).

```
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate pred);
```

18 *Effects*: Erases all but the first element from every consecutive group of equal elements referred to by the iterator `i` in the range `[first + 1, last)` for which `*i == *(i-1)` (for the version with no

arguments) or `pred(*i, *(i - 1))` (for the version with a predicate argument) holds. Invalidates only the iterators and references to the erased elements.

19 *Returns*: The number of elements erased.

20 *Throws*: Nothing unless an exception is thrown by the equality comparison or the predicate.

21 *Complexity*: If the range `[first, last)` is not empty, exactly `(last - first) - 1` applications of the corresponding predicate, otherwise no applications of the predicate.

```
void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);
```

22 *Preconditions*: `*this` and `x` are both sorted with respect to the comparator `operator<` (for the first two overloads) or `comp` (for the last two overloads), and `get_allocator() == x.get_allocator()` is `true`.

23 *Effects*: Merges the two sorted ranges `[begin(), end())` and `[x.begin(), x.end())`. `x` is empty after the merge. If an exception is thrown other than by a comparison there are no effects. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

24 *Complexity*: At most `distance(begin(), end()) + distance(x.begin(), x.end()) - 1` comparisons.

25 *Remarks*: Stable (16.4.6.8).

```
void sort();
template<class Compare> void sort(Compare comp);
```

26 *Effects*: Sorts the list according to the `operator<` or the `comp` function object. If an exception is thrown, the order of the elements in `*this` is unspecified. Does not affect the validity of iterators and references.

27 *Complexity*: Approximately $N \log N$ comparisons, where N is `distance(begin(), end())`.

28 *Remarks*: Stable (16.4.6.8).

```
void reverse() noexcept;
```

29 *Effects*: Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

30 *Complexity*: Linear time.

22.3.9.7 Erasure [forward.list.erasure]

```
template<class T, class Allocator, class U>
  typename forward_list<T, Allocator>::size_type
    erase(forward_list<T, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to: `return erase_if(c, [&](auto& elem) { return elem == value; });`

```
template<class T, class Allocator, class Predicate>
  typename forward_list<T, Allocator>::size_type
    erase_if(forward_list<T, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to: `return c.remove_if(pred);`

22.3.10 Class template `list` [list]

22.3.10.1 Overview [list.overview]

1 A `list` is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (22.3.11) and deques (22.3.8), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.

2 A `list` meets all of the requirements of a container, of a reversible container (given in two tables in 22.2), of a sequence container, including most of the optional sequence container requirements (22.2.3), and of an

allocator-aware container (Table 76). The exceptions are the `operator[]` and `at` member functions, which are not provided.[231] Descriptions are provided here only for operations on `list` that are not described in one of these tables or for operations where there is additional semantic information.

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class list {
  public:
    // types
    using value_type             = T;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 22.2
    using difference_type        = implementation-defined; // see 22.2
    using iterator               = implementation-defined; // see 22.2
    using const_iterator         = implementation-defined; // see 22.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // 22.3.10.2, construct/copy/destroy
    list() : list(Allocator()) { }
    explicit list(const Allocator&);
    explicit list(size_type n, const Allocator& = Allocator());
    list(size_type n, const T& value, const Allocator& = Allocator());
    template<class InputIterator>
      list(InputIterator first, InputIterator last, const Allocator& = Allocator());
    list(const list& x);
    list(list&& x);
    list(const list&, const Allocator&);
    list(list&&, const Allocator&);
    list(initializer_list<T>, const Allocator& = Allocator());
    ~list();
    list& operator=(const list& x);
    list& operator=(list&& x)
      noexcept(allocator_traits<Allocator>::is_always_equal::value);
    list& operator=(initializer_list<T>);
    template<class InputIterator>
      void assign(InputIterator first, InputIterator last);
    void assign(size_type n, const T& t);
    void assign(initializer_list<T>);
    allocator_type get_allocator() const noexcept;

    // iterators
    iterator               begin() noexcept;
    const_iterator         begin() const noexcept;
    iterator               end() noexcept;
    const_iterator         end() const noexcept;
    reverse_iterator       rbegin() noexcept;
    const_reverse_iterator rbegin() const noexcept;
    reverse_iterator       rend() noexcept;
    const_reverse_iterator rend() const noexcept;

    const_iterator         cbegin() const noexcept;
    const_iterator         cend() const noexcept;
    const_reverse_iterator crbegin() const noexcept;
    const_reverse_iterator crend() const noexcept;

    // 22.3.10.3, capacity
    [[nodiscard]] bool empty() const noexcept;
```

231) These member functions are only provided by containers whose iterators are random access iterators.

```
    size_type size() const noexcept;
    size_type max_size() const noexcept;
    void      resize(size_type sz);
    void      resize(size_type sz, const T& c);

    // element access
    reference       front();
    const_reference front() const;
    reference       back();
    const_reference back() const;

    // 22.3.10.4, modifiers
    template<class... Args> reference emplace_front(Args&&... args);
    template<class... Args> reference emplace_back(Args&&... args);
    void push_front(const T& x);
    void push_front(T&& x);
    void pop_front();
    void push_back(const T& x);
    void push_back(T&& x);
    void pop_back();

    template<class... Args> iterator emplace(const_iterator position, Args&&... args);
    iterator insert(const_iterator position, const T& x);
    iterator insert(const_iterator position, T&& x);
    iterator insert(const_iterator position, size_type n, const T& x);
    template<class InputIterator>
      iterator insert(const_iterator position, InputIterator first, InputIterator last);
    iterator insert(const_iterator position, initializer_list<T> il);

    iterator erase(const_iterator position);
    iterator erase(const_iterator position, const_iterator last);
    void     swap(list&) noexcept(allocator_traits<Allocator>::is_always_equal::value);
    void     clear() noexcept;

    // 22.3.10.5, list operations
    void splice(const_iterator position, list& x);
    void splice(const_iterator position, list&& x);
    void splice(const_iterator position, list& x, const_iterator i);
    void splice(const_iterator position, list&& x, const_iterator i);
    void splice(const_iterator position, list& x, const_iterator first, const_iterator last);
    void splice(const_iterator position, list&& x, const_iterator first, const_iterator last);

    size_type remove(const T& value);
    template<class Predicate> size_type remove_if(Predicate pred);

    size_type unique();
    template<class BinaryPredicate>
      size_type unique(BinaryPredicate binary_pred);

    void merge(list& x);
    void merge(list&& x);
    template<class Compare> void merge(list& x, Compare comp);
    template<class Compare> void merge(list&& x, Compare comp);

    void sort();
    template<class Compare> void sort(Compare comp);

    void reverse() noexcept;
  };

  template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
    list(InputIterator, InputIterator, Allocator = Allocator())
      -> list<iter-value-type<InputIterator>, Allocator>;
```

```
    // swap
    template<class T, class Allocator>
      void swap(list<T, Allocator>& x, list<T, Allocator>& y)
        noexcept(noexcept(x.swap(y)));
}
```

3 An incomplete type T may be used when instantiating `list` if the allocator meets the allocator completeness requirements (16.4.4.6.2). T shall be complete before any member of the resulting specialization of `list` is referenced.

22.3.10.2 Constructors, copy, and assignment [list.cons]

```
explicit list(const Allocator&);
```

1 *Effects*: Constructs an empty list, using the specified allocator.

2 *Complexity*: Constant.

```
explicit list(size_type n, const Allocator& = Allocator());
```

3 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `*this`.

4 *Effects*: Constructs a `list` with `n` default-inserted elements using the specified allocator.

5 *Complexity*: Linear in `n`.

```
list(size_type n, const T& value, const Allocator& = Allocator());
```

6 *Preconditions*: `T` is *Cpp17CopyInsertable* into `*this`.

7 *Effects*: Constructs a `list` with `n` copies of `value`, using the specified allocator.

8 *Complexity*: Linear in `n`.

```
template<class InputIterator>
  list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9 *Effects*: Constructs a `list` equal to the range `[first, last)`.

10 *Complexity*: Linear in `distance(first, last)`.

22.3.10.3 Capacity [list.capacity]

```
void resize(size_type sz);
```

1 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `*this`.

2 *Effects*: If `size() < sz`, appends `sz - size()` default-inserted elements to the sequence. If `sz <= size()`, equivalent to:

```
list<T>::iterator it = begin();
advance(it, sz);
erase(it, end());
```

```
void resize(size_type sz, const T& c);
```

3 *Preconditions*: `T` is *Cpp17CopyInsertable* into `*this`.

4 *Effects*: As if by:

```
if (sz > size())
  insert(end(), sz-size(), c);
else if (sz < size()) {
  iterator i = begin();
  advance(i, sz);
  erase(i, end());
}
else
  ;                 // do nothing
```

22.3.10.4 Modifiers [list.modifiers]

```
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
```

```
template<class InputIterator>
  iterator insert(const_iterator position, InputIterator first,
                  InputIterator last);
iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);
```

1 *Complexity*: Insertion of a single element into a list takes constant time and exactly one call to a constructor of `T`. Insertion of multiple elements into a list is linear in the number of elements inserted, and the number of calls to the copy constructor or move constructor of `T` is exactly equal to the number of elements inserted.

2 *Remarks*: Does not affect the validity of iterators and references. If an exception is thrown there are no effects.

```
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);

void pop_front();
void pop_back();
void clear() noexcept;
```

3 *Effects*: Invalidates only the iterators and references to the erased elements.

4 *Throws*: Nothing.

5 *Complexity*: Erasing a single element is a constant time operation with a single call to the destructor of `T`. Erasing a range in a list is linear time in the size of the range and the number of calls to the destructor of type `T` is exactly equal to the size of the range.

22.3.10.5 Operations [list.ops]

1 Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically for them.[232] In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall meet the corresponding requirements in 25.2. For `merge` and `sort`, the definitions and requirements in 25.8 apply.

2 `list` provides three splice operations that destructively move elements from one list to another. The behavior of splice operations is undefined if `get_allocator() != x.get_allocator()`.

```
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);
```

3 *Preconditions*: `addressof(x) != this` is `true`.

4 *Effects*: Inserts the contents of `x` before `position` and `x` becomes empty. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

5 *Throws*: Nothing.

6 *Complexity*: Constant time.

```
void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);
```

7 *Preconditions*: `i` is a valid dereferenceable iterator of `x`.

8 *Effects*: Inserts an element pointed to by `i` from list `x` before `position` and removes the element from `x`. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `*i`

232) As specified in 16.4.4.6, the requirements in this Clause apply only to lists whose allocators compare equal.

continue to refer to this same element but as a member of `*this`. Iterators to `*i` (including `i` itself) continue to refer to the same element, but now behave as iterators into `*this`, not into `x`.

9 *Throws*: Nothing.

10 *Complexity*: Constant time.

```
void splice(const_iterator position, list& x, const_iterator first,
            const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first,
            const_iterator last);
```

11 *Preconditions*: `[first, last)` is a valid range in `x`. `position` is not an iterator in the range `[first, last)`.

12 *Effects*: Inserts elements in the range `[first, last)` before `position` and removes the elements from `x`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

13 *Throws*: Nothing.

14 *Complexity*: Constant time if `addressof(x) == this`; otherwise, linear time.

```
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
```

15 *Effects*: Erases all the elements in the list referred to by a list iterator `i` for which the following conditions hold: `*i == value`, `pred(*i) != false`. Invalidates only the iterators and references to the erased elements.

16 *Returns*: The number of elements erased.

17 *Throws*: Nothing unless an exception is thrown by `*i == value` or `pred(*i) != false`.

18 *Complexity*: Exactly `size()` applications of the corresponding predicate.

19 *Remarks*: Stable (16.4.6.8).

```
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);
```

20 *Effects*: Erases all but the first element from every consecutive group of equal elements referred to by the iterator `i` in the range `[first + 1, last)` for which `*i == *(i-1)` (for the version of `unique` with no arguments) or `pred(*i, *(i - 1))` (for the version of `unique` with a predicate argument) holds. Invalidates only the iterators and references to the erased elements.

21 *Returns*: The number of elements erased.

22 *Throws*: Nothing unless an exception is thrown by `*i == *(i-1)` or `pred(*i, *(i - 1))`.

23 *Complexity*: If the range `[first, last)` is not empty, exactly `(last - first) - 1` applications of the corresponding predicate, otherwise no applications of the predicate.

```
void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);
```

24 *Preconditions*: Both the list and the argument list shall be sorted with respect to the comparator `operator<` (for the first two overloads) or `comp` (for the last two overloads), and `get_allocator() == x.get_allocator()` is `true`.

25 *Effects*: If `addressof(x) == this`, does nothing; otherwise, merges the two sorted ranges `[begin(), end())` and `[x.begin(), x.end())`. The result is a range in which the elements will be sorted in non-decreasing order according to the ordering defined by `comp`; that is, for every iterator `i`, in the range other than the first, the condition `comp(*i, *(i - 1))` will be `false`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

26 *Complexity*: At most `size() + x.size() - 1` applications of `comp` if `addressof(x) != this`; otherwise, no applications of `comp` are performed. If an exception is thrown other than by a comparison there are no effects.

27 *Remarks*: Stable (16.4.6.8). If `addressof(x) != this`, the range `[x.begin(), x.end())` is empty after the merge. No elements are copied by this operation.

```
void reverse() noexcept;
```

28 *Effects*: Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

29 *Complexity*: Linear time.

```
void sort();
template<class Compare> void sort(Compare comp);
```

30 *Effects*: Sorts the list according to the `operator<` or a `Compare` function object. If an exception is thrown, the order of the elements in `*this` is unspecified. Does not affect the validity of iterators and references.

31 *Complexity*: Approximately $N \log N$ comparisons, where `N == size()`.

32 *Remarks*: Stable (16.4.6.8).

22.3.10.6 Erasure [list.erasure]

```
template<class T, class Allocator, class U>
  typename list<T, Allocator>::size_type
    erase(list<T, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to: `return erase_if(c, [&](auto& elem) { return elem == value; });`

```
template<class T, class Allocator, class Predicate>
  typename list<T, Allocator>::size_type
    erase_if(list<T, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to: `return c.remove_if(pred);`

22.3.11 Class template `vector` [vector]

22.3.11.1 Overview [vector.overview]

1 A `vector` is a sequence container that supports (amortized) constant time insert and erase operations at the end; insert and erase in the middle take linear time. Storage management is handled automatically, though hints can be given to improve efficiency.

2 A `vector` meets all of the requirements of a container and of a reversible container (given in two tables in 22.2), of a sequence container, including most of the optional sequence container requirements (22.2.3), of an allocator-aware container (Table 76), and, for an element type other than `bool`, of a contiguous container (22.2.1). The exceptions are the `push_front`, `pop_front`, and `emplace_front` member functions, which are not provided. Descriptions are provided here only for operations on `vector` that are not described in one of these tables or for operations where there is additional semantic information.

3 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (23.3.1).

```
namespace std {
  template<class T, class Allocator = allocator<T>>
  class vector {
  public:
    // types
    using value_type             = T;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 22.2
    using difference_type        = implementation-defined; // see 22.2
    using iterator               = implementation-defined; // see 22.2
    using const_iterator         = implementation-defined; // see 22.2
```

```
using reverse_iterator       = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// 22.3.11.2, construct/copy/destroy
constexpr vector() noexcept(noexcept(Allocator())) : vector(Allocator()) { }
constexpr explicit vector(const Allocator&) noexcept;
constexpr explicit vector(size_type n, const Allocator& = Allocator());

constexpr reference       at(size_type n);
constexpr reference       front();
constexpr const_reference front() const;
constexpr reference       back();
constexpr const_reference back() const;

// 22.3.11.4, data access
constexpr T*       data() noexcept;
```

```
    constexpr const T* data() const noexcept;

    // 22.3.11.5, modifiers
    template<class... Args> constexpr reference emplace_back(Args&&... args);
    constexpr void push_back(const T& x);
    constexpr void push_back(T&& x);
    constexpr void pop_back();

    template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
    constexpr iterator insert(const_iterator position, const T& x);
    constexpr iterator insert(const_iterator position, T&& x);
    constexpr iterator insert(const_iterator position, size_type n, const T& x);
    template<class InputIterator>
      constexpr iterator insert(const_iterator position,
                                InputIterator first, InputIterator last);
    constexpr iterator insert(const_iterator position, initializer_list<T> il);
    constexpr iterator erase(const_iterator position);
    constexpr iterator erase(const_iterator first, const_iterator last);
    constexpr void     swap(vector&)
      noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
               allocator_traits<Allocator>::is_always_equal::value);
    constexpr void     clear() noexcept;
  };

  template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
    vector(InputIterator, InputIterator, Allocator = Allocator())
      -> vector<iter-value-type<InputIterator>, Allocator>;

  // swap
  template<class T, class Allocator>
    constexpr void swap(vector<T, Allocator>& x, vector<T, Allocator>& y)
      noexcept(noexcept(x.swap(y)));
}
```

4 An incomplete type `T` may be used when instantiating `vector` if the allocator meets the allocator completeness requirements (16.4.4.6.2). `T` shall be complete before any member of the resulting specialization of `vector` is referenced.

22.3.11.2 Constructors [vector.cons]

```
constexpr explicit vector(const Allocator&) noexcept;
```

1 *Effects*: Constructs an empty `vector`, using the specified allocator.

2 *Complexity*: Constant.

```
constexpr explicit vector(size_type n, const Allocator& = Allocator());
```

3 *Preconditions*: `T` is *Cpp17DefaultInsertable* into `*this`.

4 *Effects*: Constructs a `vector` with `n` default-inserted elements using the specified allocator.

5 *Complexity*: Linear in `n`.

```
constexpr vector(size_type n, const T& value,
                 const Allocator& = Allocator());
```

6 *Preconditions*: `T` is *Cpp17CopyInsertable* into `*this`.

7 *Effects*: Constructs a `vector` with `n` copies of `value`, using the specified allocator.

8 *Complexity*: Linear in `n`.

```
template<class InputIterator>
  constexpr vector(InputIterator first, InputIterator last,
                   const Allocator& = Allocator());
```

9 *Effects*: Constructs a `vector` equal to the range `[first, last)`, using the specified allocator.

10 *Complexity*: Makes only N calls to the copy constructor of `T` (where N is the distance between `first` and `last`) and no reallocations if iterators `first` and `last` are of forward, bidirectional, or random access categories. It makes order `N` calls to the copy constructor of `T` and order $\log N$ reallocations if they are just input iterators.

22.3.11.3 Capacity [vector.capacity]

```
constexpr size_type capacity() const noexcept;
```

1 *Returns*: The total number of elements that the vector can hold without requiring reallocation.

2 *Complexity*: Constant time.

```
constexpr void reserve(size_type n);
```

3 *Preconditions*: `T` is *Cpp17MoveInsertable* into `*this`.

4 *Effects*: A directive that informs a `vector` of a planned change in size, so that it can manage the storage allocation accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`. If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* type, there are no effects.

5 *Throws*: `length_error` if `n > max_size()`.[233]

6 *Complexity*: It does not change the size of the sequence and takes at most linear time in the size of the sequence.

7 *Remarks*: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[*Note 1*: If no reallocation happens, they remain valid. — *end note*]

No reallocation shall take place during insertions that happen after a call to `reserve()` until an insertion would make the size of the vector greater than the value of `capacity()`.

```
constexpr void shrink_to_fit();
```

8 *Preconditions*: `T` is *Cpp17MoveInsertable* into `*this`.

9 *Effects*: `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[*Note 2*: The request is non-binding to allow latitude for implementation-specific optimizations. — *end note*]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation. If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* `T` there are no effects.

10 *Complexity*: If reallocation happens, linear in the size of the sequence.

11 *Remarks*: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator.

[*Note 3*: If no reallocation happens, they remain valid. — *end note*]

```
constexpr void swap(vector& x)
  noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

12 *Effects*: Exchanges the contents and `capacity()` of `*this` with that of `x`.

13 *Complexity*: Constant time.

```
constexpr void resize(size_type sz);
```

14 *Preconditions*: `T` is *Cpp17MoveInsertable* and *Cpp17DefaultInsertable* into `*this`.

15 *Effects*: If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` default-inserted elements to the sequence.

16 *Remarks*: If an exception is thrown other than by the move constructor of a non-*Cpp17CopyInsertable* `T` there are no effects.

233) `reserve()` uses `Allocator::allocate()` which can throw an appropriate exception.

```
constexpr void resize(size_type sz, const T& c);
```

17 *Preconditions*: `T` is *Cpp17CopyInsertable* into `*this`.

18 *Effects*: If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` copies of `c` to the sequence.

19 *Remarks*: If an exception is thrown there are no effects.

22.3.11.4 Data [vector.data]

```
constexpr T*         data() noexcept;
constexpr const T*   data() const noexcept;
```

1 *Returns*: A pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == addressof(front())`.

2 *Complexity*: Constant time.

22.3.11.5 Modifiers [vector.modifiers]

```
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
constexpr iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> constexpr reference emplace_back(Args&&... args);
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
```

1 *Complexity*: If reallocation happens, linear in the number of elements of the resulting vector; otherwise, linear in the number of elements inserted plus the distance to the end of the vector.

2 *Remarks*: Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator. If no reallocation happens, then references, pointers, and iterators before the insertion point remain valid but those at or after the insertion point, including the past-the-end iterator, are invalidated. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of `T` or by any `InputIterator` operation there are no effects. If an exception is thrown while inserting a single element at the end and `T` is *Cpp17CopyInsertable* or `is_nothrow_move_constructible_v<T>` is `true`, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-*Cpp17CopyInsertable* `T`, the effects are unspecified.

```
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_back();
```

3 *Effects*: Invalidates iterators and references at or after the point of the erase.

4 *Throws*: Nothing unless an exception is thrown by the assignment operator or move assignment operator of `T`.

5 *Complexity*: The destructor of `T` is called the number of times equal to the number of the elements erased, but the assignment operator of `T` is called the number of times equal to the number of elements in the vector after the erased elements.

22.3.11.6 Erasure [vector.erasure]

```
template<class T, class Allocator, class U>
  constexpr typename vector<T, Allocator>::size_type
    erase(vector<T, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
```

```
    return r;
```

```
template<class T, class Allocator, class Predicate>
  constexpr typename vector<T, Allocator>::size_type
    erase_if(vector<T, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

22.3.12 Class vector<bool> [vector.bool]

1 To optimize space allocation, a specialization of vector for `bool` elements is provided:

```
namespace std {
  template<class Allocator>
  class vector<bool, Allocator> {
  public:
    // types
    using value_type             = bool;
    using allocator_type         = Allocator;
    using pointer                = implementation-defined;
    using const_pointer          = implementation-defined;
    using const_reference        = bool;
    using size_type              = implementation-defined; // see 22.2
    using difference_type        = implementation-defined; // see 22.2
    using iterator               = implementation-defined; // see 22.2
    using const_iterator         = implementation-defined; // see 22.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // bit reference
    class reference {
      friend class vector;
      constexpr reference() noexcept;
    public:
      constexpr reference(const reference&) = default;
      constexpr ~reference();
      constexpr operator bool() const noexcept;
      constexpr reference& operator=(const bool x) noexcept;
      constexpr reference& operator=(const reference& x) noexcept;
      constexpr void flip() noexcept;    // flips the bit
    };

    // construct/copy/destroy
    constexpr vector() : vector(Allocator()) { }
    constexpr explicit vector(const Allocator&);
    constexpr explicit vector(size_type n, const Allocator& = Allocator());
    constexpr vector(size_type n, const bool& value, const Allocator& = Allocator());
    template<class InputIterator>
      constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
    constexpr vector(const vector& x);
    constexpr vector(vector&& x);
    constexpr vector(const vector&, const Allocator&);
    constexpr vector(vector&&, const Allocator&);
    constexpr vector(initializer_list<bool>, const Allocator& = Allocator()));
    constexpr ~vector();
    constexpr vector& operator=(const vector& x);
    constexpr vector& operator=(vector&& x);
    constexpr vector& operator=(initializer_list<bool>);
    template<class InputIterator>
      constexpr void assign(InputIterator first, InputIterator last);
    constexpr void assign(size_type n, const bool& t);
```

```
    constexpr void assign(initializer_list<bool>);
    constexpr allocator_type get_allocator() const noexcept;

    // iterators
    constexpr iterator               begin() noexcept;
    constexpr const_iterator         begin() const noexcept;
    constexpr iterator               end() noexcept;
    constexpr const_iterator         end() const noexcept;
    constexpr reverse_iterator       rbegin() noexcept;
    constexpr const_reverse_iterator rbegin() const noexcept;
    constexpr reverse_iterator       rend() noexcept;
    constexpr const_reverse_iterator rend() const noexcept;

    constexpr const_iterator         cbegin() const noexcept;
    constexpr const_iterator         cend() const noexcept;
    constexpr const_reverse_iterator crbegin() const noexcept;
    constexpr const_reverse_iterator crend() const noexcept;

    // capacity
    [[nodiscard]] constexpr bool empty() const noexcept;
    constexpr size_type size() const noexcept;
    constexpr size_type max_size() const noexcept;
    constexpr size_type capacity() const noexcept;
    constexpr void      resize(size_type sz, bool c = false);
    constexpr void      reserve(size_type n);
    constexpr void      shrink_to_fit();

    // element access
    constexpr reference       operator[](size_type n);
    constexpr const_reference operator[](size_type n) const;
    constexpr const_reference at(size_type n) const;
    constexpr reference       at(size_type n);
    constexpr reference       front();
    constexpr const_reference front() const;
    constexpr reference       back();
    constexpr const_reference back() const;

    // modifiers
    template<class... Args> constexpr reference emplace_back(Args&&... args);
    constexpr void push_back(const bool& x);
    constexpr void pop_back();
    template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
    constexpr iterator insert(const_iterator position, const bool& x);
    constexpr iterator insert(const_iterator position, size_type n, const bool& x);
    template<class InputIterator>
      constexpr iterator insert(const_iterator position,
                                InputIterator first, InputIterator last);
    constexpr iterator insert(const_iterator position, initializer_list<bool> il);

    constexpr iterator erase(const_iterator position);
    constexpr iterator erase(const_iterator first, const_iterator last);
    constexpr void swap(vector&);
    constexpr static void swap(reference x, reference y) noexcept;
    constexpr void flip() noexcept;     // flips all bits
    constexpr void clear() noexcept;
  };
}
```

2 Unless described below, all operations have the same requirements and semantics as the primary `vector` template, except that operations dealing with the `bool` value type map to bit values in the container storage and `allocator_traits::construct` (20.10.9.3) is not used to construct these values.

3 There is no requirement that the data be stored as a contiguous allocation of `bool` values. A space-optimized representation of bits is recommended instead.

4 `reference` is a class that simulates the behavior of references of a single bit in `vector<bool>`. The conversion function returns `true` when the bit is set, and `false` otherwise. The assignment operator sets the bit when the argument is (convertible to) `true` and clears it otherwise. `flip` reverses the state of the bit.

```
constexpr void flip() noexcept;
```

5 *Effects*: Replaces each element in the container with its complement.

```
constexpr static void swap(reference x, reference y) noexcept;
```

6 *Effects*: Exchanges the contents of `x` and `y` as if by:

```
bool b = x;
x = y;
y = b;
```

```
template<class Allocator> struct hash<vector<bool, Allocator>>;
```

7 The specialization is enabled (20.14.19).

22.4 Associative containers [associative]

22.4.1 In general [associative.general]

1 The header `<map>` defines the class templates `map` and `multimap`; the header `<set>` defines the class templates `set` and `multiset`.

2 The following exposition-only alias templates may appear in deduction guides for associative containers:

```
template<class InputIterator>
  using iter-value-type =
    typename iterator_traits<InputIterator>::value_type;                // exposition only
template<class InputIterator>
  using iter-key-type = remove_const_t<
    typename iterator_traits<InputIterator>::value_type::first_type>;   // exposition only
template<class InputIterator>
  using iter-mapped-type =
    typename iterator_traits<InputIterator>::value_type::second_type;   // exposition only
template<class InputIterator>
  using iter-to-alloc-type = pair<
    add_const_t<typename iterator_traits<InputIterator>::value_type::first_type>,
    typename iterator_traits<InputIterator>::value_type::second_type>;  // exposition only
```

22.4.2 Header `<map>` synopsis [associative.map.syn]

```
#include <compare>              // see 17.11.1
#include <initializer_list>     // see 17.10.2

namespace std {
  // 22.4.4, class template map
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>
    class map;

  template<class Key, class T, class Compare, class Allocator>
    bool operator==(const map<Key, T, Compare, Allocator>& x,
                    const map<Key, T, Compare, Allocator>& y);
  template<class Key, class T, class Compare, class Allocator>
    synth-three-way-result<pair<const Key, T>>
      operator<=>(const map<Key, T, Compare, Allocator>& x,
                  const map<Key, T, Compare, Allocator>& y);

  template<class Key, class T, class Compare, class Allocator>
    void swap(map<Key, T, Compare, Allocator>& x,
              map<Key, T, Compare, Allocator>& y)
      noexcept(noexcept(x.swap(y)));
```

```
  template<class Key, class T, class Compare, class Allocator, class Predicate>
    typename map<Key, T, Compare, Allocator>::size_type
      erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);

  // 22.4.5, class template multimap
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>
    class multimap;

  template<class Key, class T, class Compare, class Allocator>
    bool operator==(const multimap<Key, T, Compare, Allocator>& x,
                    const multimap<Key, T, Compare, Allocator>& y);
  template<class Key, class T, class Compare, class Allocator>
    synth-three-way-result<pair<const Key, T>>
      operator<=>(const multimap<Key, T, Compare, Allocator>& x,
                  const multimap<Key, T, Compare, Allocator>& y);

  template<class Key, class T, class Compare, class Allocator>
    void swap(multimap<Key, T, Compare, Allocator>& x,
              multimap<Key, T, Compare, Allocator>& y)
      noexcept(noexcept(x.swap(y)));

  template<class Key, class T, class Compare, class Allocator, class Predicate>
    typename multimap<Key, T, Compare, Allocator>::size_type
      erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);

  namespace pmr {
    template<class Key, class T, class Compare = less<Key>>
      using map = std::map<Key, T, Compare,
                           polymorphic_allocator<pair<const Key, T>>>;

    template<class Key, class T, class Compare = less<Key>>
      using multimap = std::multimap<Key, T, Compare,
                                     polymorphic_allocator<pair<const Key, T>>>;
  }
}
```

22.4.3 Header <set> synopsis [associative.set.syn]

```
#include <compare>              // see 17.11.1
#include <initializer_list>     // see 17.10.2

namespace std {
  // 22.4.6, class template set
  template<class Key, class Compare = less<Key>, class Allocator = allocator<Key>>
    class set;

  template<class Key, class Compare, class Allocator>
    bool operator==(const set<Key, Compare, Allocator>& x,
                    const set<Key, Compare, Allocator>& y);
  template<class Key, class Compare, class Allocator>
    synth-three-way-result<Key> operator<=>(const set<Key, Compare, Allocator>& x,
                                            const set<Key, Compare, Allocator>& y);

  template<class Key, class Compare, class Allocator>
    void swap(set<Key, Compare, Allocator>& x,
              set<Key, Compare, Allocator>& y)
      noexcept(noexcept(x.swap(y)));

  template<class Key, class Compare, class Allocator, class Predicate>
    typename set<Key, Compare, Allocator>::size_type
      erase_if(set<Key, Compare, Allocator>& c, Predicate pred);
```

```
  // 22.4.7, class template multiset
  template<class Key, class Compare = less<Key>, class Allocator = allocator<Key>>
    class multiset;

  template<class Key, class Compare, class Allocator>
    bool operator==(const multiset<Key, Compare, Allocator>& x,
                    const multiset<Key, Compare, Allocator>& y);
  template<class Key, class Compare, class Allocator>
    synth-three-way-result<Key> operator<=>(const multiset<Key, Compare, Allocator>& x,
                                            const multiset<Key, Compare, Allocator>& y);

  template<class Key, class Compare, class Allocator>
    void swap(multiset<Key, Compare, Allocator>& x,
              multiset<Key, Compare, Allocator>& y)
      noexcept(noexcept(x.swap(y)));

  template<class Key, class Compare, class Allocator, class Predicate>
    typename multiset<Key, Compare, Allocator>::size_type
      erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);

  namespace pmr {
    template<class Key, class Compare = less<Key>>
      using set = std::set<Key, Compare, polymorphic_allocator<Key>>;

    template<class Key, class Compare = less<Key>>
      using multiset = std::multiset<Key, Compare, polymorphic_allocator<Key>>;
  }
}
```

22.4.4 Class template map [map]

22.4.4.1 Overview [map.overview]

1 A `map` is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of values of another type `T` based on the keys. The `map` class supports bidirectional iterators.

2 A `map` meets all of the requirements of a container, of a reversible container (22.2), of an associative container (22.2.6), and of an allocator-aware container (Table 76). A `map` also provides most operations described in 22.2.6 for unique keys. This means that a `map` supports the `a_uniq` operations in 22.2.6 but not the `a_eq` operations. For a `map<Key,T>` the `key_type` is `Key` and the `value_type` is `pair<const Key,T>`. Descriptions are provided here only for operations on `map` that are not described in one of those tables or for operations where there is additional semantic information.

```
namespace std {
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>
  class map {
  public:
    // types
    using key_type               = Key;
    using mapped_type            = T;
    using value_type             = pair<const Key, T>;
    using key_compare            = Compare;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 22.2
    using difference_type        = implementation-defined; // see 22.2
    using iterator               = implementation-defined; // see 22.2
    using const_iterator         = implementation-defined; // see 22.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;
```

```
using node_type              = unspecified;
using insert_return_type     = insert-return-type<iterator, node_type>;

      noexcept(noexcept(x.swap(y)));
}
```

22.4.4.2 Constructors, copy, and assignment [map.cons]

```
explicit map(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `map` using the specified comparison object and allocator.

2 *Complexity*: Constant.

```
template<class InputIterator>
  map(InputIterator first, InputIterator last,
```

```
     const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects*: Constructs an empty `map` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

4 *Complexity*: Linear in N if the range `[first, last)` is already sorted using `comp` and otherwise $N \log N$, where N is `last - first`.

22.4.4.3 Element access [map.access]

```
mapped_type& operator[](const key_type& x);
```

1 *Effects*: Equivalent to: `return try_emplace(x).first->second;`

```
mapped_type& operator[](key_type&& x);
```

2 *Effects*: Equivalent to: `return try_emplace(move(x)).first->second;`

```
mapped_type&       at(const key_type& x);
const mapped_type& at(const key_type& x) const;
```

3 *Returns*: A reference to the `mapped_type` corresponding to `x` in `*this`.

4 *Throws*: An exception object of type `out_of_range` if no such element is present.

5 *Complexity*: Logarithmic.

22.4.4.4 Modifiers [map.modifiers]

```
template<class P>
  pair<iterator, bool> insert(P&& x);
template<class P>
  iterator insert(const_iterator position, P&& x);
```

1 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

2 *Effects*: The first form is equivalent to `return emplace(std::forward<P>(x))`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x))`.

```
template<class... Args>
  pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template<class... Args>
  iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

3 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `map` from `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

4 *Effects*: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

5 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

6 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class... Args>
  pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
  iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

7 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `map` from `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

8 *Effects*: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

9 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

10 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
  pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
  iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
```

11 *Mandates*: `is_assignable_v<mapped_type&, M&&>` is `true`.

12 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `map` from `k`, `forward<M>(obj)`.

13 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k`, `std::forward<M>(obj)`.

14 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

15 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
  pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
  iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

16 *Mandates*: `is_assignable_v<mapped_type&, M&&>` is `true`.

17 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `map` from `move(k)`, `forward<M>(obj)`.

18 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k)`, `std::forward<M>(obj)`.

19 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

20 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

22.4.4.5 Erasure [map.erasure]

```
template<class Key, class T, class Compare, class Allocator, class Predicate>
  typename map<Key, T, Compare, Allocator>::size_type
    erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

22.4.5 Class template `multimap` [multimap]

22.4.5.1 Overview [multimap.overview]

1 A `multimap` is an associative container that supports equivalent keys (possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type `T` based on the keys. The `multimap` class supports bidirectional iterators.

2 A `multimap` meets all of the requirements of a container and of a reversible container (22.2), of an associative container (22.2.6), and of an allocator-aware container (Table 76). A `multimap` also provides most operations described in 22.2.6 for equal keys. This means that a `multimap` supports the `a_eq` operations in 22.2.6 but not the `a_uniq` operations. For a `multimap<Key,T>` the `key_type` is `Key` and the `value_type` is `pair<const Key,T>`. Descriptions are provided here only for operations on `multimap` that are not described in one of those tables or for operations where there is additional semantic information.

```
namespace std {
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>
  class multimap {
  public:
    // types
    using key_type               = Key;
    using mapped_type            = T;
    using value_type             = pair<const Key, T>;
    using key_compare            = Compare;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;

  template<class Key, class T, class Allocator>
    multimap(initializer_list<pair<Key, T>>, Allocator)
      -> multimap<Key, T, less<Key>, Allocator>;

  // swap
  template<class Key, class T, class Compare, class Allocator>
    void swap(multimap<Key, T, Compare, Allocator>& x,
              multimap<Key, T, Compare, Allocator>& y)
      noexcept(noexcept(x.swap(y)));
}
```

22.4.5.2 Constructors [multimap.cons]

```
explicit multimap(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `multimap` using the specified comparison object and allocator.

2 *Complexity*: Constant.

```
template<class InputIterator>
  multimap(InputIterator first, InputIterator last,
           const Compare& comp = Compare(),
           const Allocator& = Allocator());
```

3 *Effects*: Constructs an empty `multimap` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

4 *Complexity*: Linear in N if the range `[first, last)` is already sorted using `comp` and otherwise $N \log N$, where N is `last - first`.

22.4.5.3 Modifiers [multimap.modifiers]

```
template<class P> iterator insert(P&& x);
template<class P> iterator insert(const_iterator position, P&& x);
```

1 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

2 *Effects*: The first form is equivalent to `return emplace(std::forward<P>(x))`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x))`.

22.4.5.4 Erasure [multimap.erasure]

```
template<class Key, class T, class Compare, class Allocator, class Predicate>
  typename multimap<Key, T, Compare, Allocator>::size_type
    erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

22.4.6 Class template set [set]

22.4.6.1 Overview [set.overview]

1 A `set` is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of the keys themselves. The `set` class supports bidirectional iterators.

2 A `set` meets all of the requirements of a container, of a reversible container (22.2), of an associative container (22.2.6), and of an allocator-aware container (Table 76). A `set` also provides most operations described in 22.2.6 for unique keys. This means that a `set` supports the `a_uniq` operations in 22.2.6 but not the `a_eq` operations. For a `set<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on `set` that are not described in one of these tables and for operations where there is additional semantic information.

```
namespace std {
  template<class Key, class Compare = less<Key>,
           class Allocator = allocator<Key>>
  class set {
  public:
    // types
    using key_type               = Key;
    using key_compare            = Compare;
    using value_type             = Key;
    using value_compare          = Compare;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 22.2
    using difference_type        = implementation-defined; // see 22.2
    using iterator               = implementation-defined; // see 22.2
    using const_iterator         = implementation-defined; // see 22.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;
    using node_type              = unspecified;
    using insert_return_type     = insert-return-type<iterator, node_type>;
```

```

22.4.6.2 Constructors, copy, and assignment [set.cons]

```
explicit set(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `set` using the specified comparison objects and allocator.

2 *Complexity*: Constant.

```
template<class InputIterator>
  set(InputIterator first, InputIterator last,
      const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects*: Constructs an empty `set` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

4 *Complexity*: Linear in N if the range `[first, last)` is already sorted using `comp` and otherwise $N \log N$, where N is `last - first`.

22.4.6.3 Erasure [set.erasure]

```
template<class Key, class Compare, class Allocator, class Predicate>
  typename set<Key, Compare, Allocator>::size_type
    erase_if(set<Key, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

22.4.7 Class template `multiset` [multiset]

22.4.7.1 Overview [multiset.overview]

1 A `multiset` is an associative container that supports equivalent keys (possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The `multiset` class supports bidirectional iterators.

2 A `multiset` meets all of the requirements of a container, of a reversible container (22.2), of an associative container (22.2.6), and of an allocator-aware container (Table 76). `multiset` also provides most operations described in 22.2.6 for duplicate keys. This means that a `multiset` supports the `a_eq` operations in 22.2.6 but not the `a_uniq` operations. For a `multiset<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on `multiset` that are not described in one of these tables and for operations where there is additional semantic information.

```
namespace std {
  template<class Key, class Compare = less<Key>,
           class Allocator = allocator<Key>>
  class multiset {
  public:
    // types
    using key_type               = Key;
    using key_compare            = Compare;
    using value_type             = Key;
    using value_compare          = Compare;
    using allocator_type         = Allocator;
    using pointer                = typename allocator_traits<Allocator>::pointer;
    using const_pointer          = typename allocator_traits<Allocator>::const_pointer;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using size_type              = implementation-defined; // see 22.2
    using difference_type        = implementation-defined; // see 22.2
    using iterator               = implementation-defined; // see 22.2
    using const_iterator         = implementation-defined; // see 22.2
    using reverse_iterator       = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;
    using node_type              = unspecified;

    // 22.4.7.2, construct/copy/destroy
    multiset() : multiset(Compare()) { }

22.4.7.2 Constructors [multiset.cons]

```
explicit multiset(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects*: Constructs an empty `multiset` using the specified comparison object and allocator.

2 *Complexity*: Constant.

```
template<class InputIterator>
  multiset(InputIterator first, InputIterator last,
           const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects*: Constructs an empty `multiset` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

4 *Complexity*: Linear in N if the range `[first, last)` is already sorted using `comp` and otherwise $N \log N$, where N is `last - first`.

22.4.7.3 Erasure [multiset.erasure]

```
template<class Key, class Compare, class Allocator, class Predicate>
  typename multiset<Key, Compare, Allocator>::size_type
    erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
```

```
return original_size - c.size();
```

22.5 Unordered associative containers [unord]

22.5.1 In general [unord.general]

1 The header `<unordered_map>` defines the class templates `unordered_map` and `unordered_multimap`; the header `<unordered_set>` defines the class templates `unordered_set` and `unordered_multiset`.

2 The exposition-only alias templates *`iter-value-type`*, *`iter-key-type`*, *`iter-mapped-type`*, and *`iter-to-alloc-type`* defined in 22.4.1 may appear in deduction guides for unordered containers.

22.5.2 Header `<unordered_map>` synopsis [unord.map.syn]

```
#include <compare>              // see 17.11.1
#include <initializer_list>     // see 17.10.2

namespace std {
  // 22.5.4, class template unordered_map
  template<class Key,
           class T,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Alloc = allocator<pair<const Key, T>>>
    class unordered_map;

  // 22.5.5, class template unordered_multimap
  template<class Key,
           class T,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Alloc = allocator<pair<const Key, T>>>
    class unordered_multimap;

  template<class Key, class T, class Hash, class Pred, class Alloc>
    bool operator==(const unordered_map<Key, T, Hash, Pred, Alloc>& a,

}
```

22.5.4 Class template unordered_map [unord.map]

22.5.4.1 Overview [unord.map.overview]

1 An `unordered_map` is an unordered associative container that supports unique keys (an `unordered_map` contains at most one of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_map` class supports forward iterators.

2 An `unordered_map` meets all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 76). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_map` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_map<Key, T>` the `key type` is `Key`, the mapped type is `T`, and the value type is `pair<const Key, T>`.

3 Subclause 22.5.4 only describes operations on `unordered_map` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
  template<class Key,
           class T,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Allocator = allocator<pair<const Key, T>>>
  class unordered_map {
  public:
    // types
    using key_type             = Key;
    using mapped_type          = T;
    using value_type           = pair<const Key, T>;
    using hasher               = Hash;
    using key_equal            = Pred;
    using allocator_type       = Allocator;
    using pointer              = typename allocator_traits<Allocator>::pointer;
    using const_pointer        = typename allocator_traits<Allocator>::const_pointer;

        -> unordered_map<Key, T, Hash, equal_to<Key>, Allocator>;

    // swap
    template<class Key, class T, class Hash, class Pred, class Alloc>
      void swap(unordered_map<Key, T, Hash, Pred, Alloc>& x,
                unordered_map<Key, T, Hash, Pred, Alloc>& y)
        noexcept(noexcept(x.swap(y)));
  }
```

4 A `size_type` parameter type in an `unordered_map` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

22.5.4.2 Constructors [unord.map.cnstr]

```
unordered_map() : unordered_map(size_type(see below)) { }
explicit unordered_map(size_type n,
                       const hasher& hf = hasher(),
                       const key_equal& eql = key_equal(),
                       const allocator_type& a = allocator_type());
```

1 *Effects*: Constructs an empty `unordered_map` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns `1.0`.

2 *Complexity*: Constant.

```
template<class InputIterator>
  unordered_map(InputIterator f, InputIterator l,
                size_type n = see below,
                const hasher& hf = hasher(),
                const key_equal& eql = key_equal(),
                const allocator_type& a = allocator_type());
unordered_map(initializer_list<value_type> il,
              size_type n = see below,
              const hasher& hf = hasher(),
              const key_equal& eql = key_equal(),
              const allocator_type& a = allocator_type());
```

3 *Effects*: Constructs an empty `unordered_map` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns `1.0`.

4 *Complexity*: Average case linear, worst case quadratic.

22.5.4.3 Element access [unord.map.elem]

```
mapped_type& operator[](const key_type& k);
```

1 *Effects*: Equivalent to: `return try_emplace(k).first->second;`

```
mapped_type& operator[](key_type&& k);
```

2 *Effects*: Equivalent to: `return try_emplace(move(k)).first->second;`

```
mapped_type& at(const key_type& k);
const mapped_type& at(const key_type& k) const;
```

3 *Returns*: A reference to `x.second`, where `x` is the (unique) element whose key is equivalent to `k`.

4 *Throws*: An exception object of type `out_of_range` if no such element is present.

22.5.4.4 Modifiers [unord.map.modifiers]

```
template<class P>
  pair<iterator, bool> insert(P&& obj);
```

1 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

2 *Effects*: Equivalent to: `return emplace(std::forward<P>(obj));`

```
template<class P>
  iterator insert(const_iterator hint, P&& obj);
```

3 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

4 *Effects*: Equivalent to: `return emplace_hint(hint, std::forward<P>(obj));`

```
template<class... Args>
  pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template<class... Args>
  iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

5 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

6 *Effects*: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

7 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

8 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class... Args>
  pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
  iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

9 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

10 *Effects*: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

11 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

12 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
  pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
  iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
```

13 *Mandates*: `is_assignable_v<mapped_type&, M&&>` is `true`.

14 *Preconditions*: `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `k`, `std::forward<M>(obj)`.

15 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k`, `std::forward<M>(obj)`.

16 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

17 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
  pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
  iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

18 *Mandates*: `is_assignable_v<mapped_type&, M&&>` is `true`.

Preconditions: `value_type` is *Cpp17EmplaceConstructible* into `unordered_map` from `std::move(k)`, `std::forward<M>(obj)`.

19 *Effects*: If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k)`, `std::forward<M>(obj)`.

20 *Returns*: In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

21 *Complexity*: The same as `emplace` and `emplace_hint`, respectively.

22.5.4.5 Erasure [unord.map.erasure]

```
template<class K, class T, class H, class P, class A, class Predicate>
  typename unordered_map<K, T, H, P, A>::size_type
    erase_if(unordered_map<K, T, H, P, A>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

22.5.5 Class template `unordered_multimap` [unord.multimap]

22.5.5.1 Overview [unord.multimap.overview]

1 An `unordered_multimap` is an unordered associative container that supports equivalent keys (an instance of `unordered_multimap` may contain multiple copies of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_multimap` class supports forward iterators.

2 An `unordered_multimap` meets all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 76). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multimap` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multimap<Key, T>` the `key type` is `Key`, the mapped type is `T`, and the value type is `pair<const Key, T>`.

3 Subclause 22.5.5 only describes operations on `unordered_multimap` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
  template<class Key,
           class T,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Allocator = allocator<pair<const Key, T>>>
  class unordered_multimap {
  public:
    // types
    using key_type             = Key;
    using mapped_type          = T;
    using value_type           = pair<const Key, T>;
    using hasher               = Hash;
    using key_equal            = Pred;
    using allocator_type       = Allocator;
    using pointer              = typename allocator_traits<Allocator>::pointer;
    using const_pointer        = typename allocator_traits<Allocator>::const_pointer;
    using reference            = value_type&;
    using const_reference      = const value_type&;
    using size_type            = implementation-defined; // see 22.2
    using difference_type      = implementation-defined; // see 22.2

    using iterator             = implementation-defined; // see 22.2
    using const_iterator       = implementation-defined; // see 22.2
```

```
using local_iterator       = implementation-defined; // see 22.2
using const_local_iterator = implementation-defined; // see 22.2
using node_type            = unspecified;

                            hash<iter-key-type<InputIterator>>,
                            equal_to<iter-key-type<InputIterator>>, Allocator>;

  template<class InputIterator, class Hash, class Allocator>
    unordered_multimap(InputIterator, InputIterator, typename see below::size_type, Hash,
                       Allocator)
      -> unordered_multimap<iter-key-type<InputIterator>, iter-mapped-type<InputIterator>, Hash,
                            equal_to<iter-key-type<InputIterator>>, Allocator>;

  template<class Key, class T, class Allocator>
    unordered_multimap(initializer_list<pair<Key, T>>, typename see below::size_type,
                       Allocator)
      -> unordered_multimap<Key, T, hash<Key>, equal_to<Key>, Allocator>;

  template<class Key, class T, class Allocator>
    unordered_multimap(initializer_list<pair<Key, T>>, Allocator)
      -> unordered_multimap<Key, T, hash<Key>, equal_to<Key>, Allocator>;

  template<class Key, class T, class Hash, class Allocator>
    unordered_multimap(initializer_list<pair<Key, T>>, typename see below::size_type,
                       Hash, Allocator)
      -> unordered_multimap<Key, T, Hash, equal_to<Key>, Allocator>;
```

```
    // swap
    template<class Key, class T, class Hash, class Pred, class Alloc>
      void swap(unordered_multimap<Key, T, Hash, Pred, Alloc>& x,
                unordered_multimap<Key, T, Hash, Pred, Alloc>& y)
        noexcept(noexcept(x.swap(y)));
  }
```

4 A `size_type` parameter type in an `unordered_multimap` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

22.5.5.2 Constructors [unord.multimap.cnstr]

```
unordered_multimap() : unordered_multimap(size_type(see below)) { }
explicit unordered_multimap(size_type n,
                            const hasher& hf = hasher(),
                            const key_equal& eql = key_equal(),
                            const allocator_type& a = allocator_type());
```

1 *Effects*: Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns `1.0`.

2 *Complexity*: Constant.

```
template<class InputIterator>
  unordered_multimap(InputIterator f, InputIterator l,
                     size_type n = see below,
                     const hasher& hf = hasher(),
                     const key_equal& eql = key_equal(),
                     const allocator_type& a = allocator_type());
unordered_multimap(initializer_list<value_type> il,
                   size_type n = see below,
                   const hasher& hf = hasher(),
                   const key_equal& eql = key_equal(),
                   const allocator_type& a = allocator_type());
```

3 *Effects*: Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns `1.0`.

4 *Complexity*: Average case linear, worst case quadratic.

22.5.5.3 Modifiers [unord.multimap.modifiers]

```
template<class P>
  iterator insert(P&& obj);
```

1 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

2 *Effects*: Equivalent to: `return emplace(std::forward<P>(obj));`

```
template<class P>
  iterator insert(const_iterator hint, P&& obj);
```

3 *Constraints*: `is_constructible_v<value_type, P&&>` is `true`.

4 *Effects*: Equivalent to: `return emplace_hint(hint, std::forward<P>(obj));`

22.5.5.4 Erasure [unord.multimap.erasure]

```
template<class K, class T, class H, class P, class A, class Predicate>
  typename unordered_multimap<K, T, H, P, A>::size_type
    erase_if(unordered_multimap<K, T, H, P, A>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
```

```
    } else {
      ++i;
    }
  }
  return original_size - c.size();
```

22.5.6 Class template unordered_set [unord.set]

22.5.6.1 Overview [unord.set.overview]

1 An `unordered_set` is an unordered associative container that supports unique keys (an `unordered_set` contains at most one of each key value) and in which the elements' keys are the elements themselves. The `unordered_set` class supports forward iterators.

2 An `unordered_set` meets all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 76). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_set` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_set<Key>` the `key type` and the value type are both `Key`. The `iterator` and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.

3 Subclause 22.5.6 only describes operations on `unordered_set` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
  template<class Key,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Allocator = allocator<Key>>
  class unordered_set {
  public:
    // types
    using key_type              = Key;
    using value_type            = Key;
    using hasher                = Hash;
    using key_equal             = Pred;
    using allocator_type        = Allocator;
    using pointer               = typename allocator_traits<Allocator>::pointer;
    using const_pointer         = typename allocator_traits<Allocator>::const_pointer;
    using reference             = value_type&;
    using const_reference       = const value_type&;

  // swap
  template<class Key, class Hash, class Pred, class Alloc>
    void swap(unordered_set<Key, Hash, Pred, Alloc>& x,
              unordered_set<Key, Hash, Pred, Alloc>& y)
      noexcept(noexcept(x.swap(y)));
}
```

4 A `size_type` parameter type in an `unordered_set` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

22.5.6.2 Constructors [unord.set.cnstr]

```
unordered_set() : unordered_set(size_type(see below)) { }
explicit unordered_set(size_type n,
                       const hasher& hf = hasher(),
                       const key_equal& eql = key_equal(),
                       const allocator_type& a = allocator_type());
```

1 *Effects*: Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns `1.0`.

2 *Complexity*: Constant.

```
template<class InputIterator>
  unordered_set(InputIterator f, InputIterator l,
                size_type n = see below,
                const hasher& hf = hasher(),
                const key_equal& eql = key_equal(),
                const allocator_type& a = allocator_type());
unordered_set(initializer_list<value_type> il,
              size_type n = see below,
              const hasher& hf = hasher(),
              const key_equal& eql = key_equal(),
```

```
      const allocator_type& a = allocator_type());
```

3 *Effects*: Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns `1.0`.

4 *Complexity*: Average case linear, worst case quadratic.

22.5.6.3 Erasure [unord.set.erasure]

```
template<class K, class H, class P, class A, class Predicate>
  typename unordered_set<K, H, P, A>::size_type
    erase_if(unordered_set<K, H, P, A>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

22.5.7 Class template `unordered_multiset` [unord.multiset]

22.5.7.1 Overview [unord.multiset.overview]

1 An `unordered_multiset` is an unordered associative container that supports equivalent keys (an instance of `unordered_multiset` may contain multiple copies of the same key value) and in which each element's key is the element itself. The `unordered_multiset` class supports forward iterators.

2 An `unordered_multiset` meets all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 76). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multiset` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multiset<Key>` the `key type` and the value type are both `Key`. The `iterator` and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.

3 Subclause 22.5.7 only describes operations on `unordered_multiset` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
  template<class Key,
           class Hash = hash<Key>,
           class Pred = equal_to<Key>,
           class Allocator = allocator<Key>>
  class unordered_multiset {
  public:
    // types
    using key_type             = Key;
    using value_type           = Key;
    using hasher               = Hash;
    using key_equal            = Pred;
    using allocator_type       = Allocator;
    using pointer              = typename allocator_traits<Allocator>::pointer;
    using const_pointer        = typename allocator_traits<Allocator>::const_pointer;
    using reference            = value_type&;
    using const_reference      = const value_type&;
    using size_type            = implementation-defined; // see 22.2
    using difference_type      = implementation-defined; // see 22.2

  // swap
  template<class Key, class Hash, class Pred, class Alloc>
    void swap(unordered_multiset<Key, Hash, Pred, Alloc>& x,
              unordered_multiset<Key, Hash, Pred, Alloc>& y)
      noexcept(noexcept(x.swap(y)));
}
```

4 A `size_type` parameter type in an `unordered_multiset` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

22.5.7.2 Constructors [unord.multiset.cnstr]

```
unordered_multiset() : unordered_multiset(size_type(see below)) { }
```

```
explicit unordered_multiset(size_type n,
                            const hasher& hf = hasher(),
                            const key_equal& eql = key_equal(),
                            const allocator_type& a = allocator_type());
```

1 *Effects*: Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns `1.0`.

2 *Complexity*: Constant.

```
template<class InputIterator>
  unordered_multiset(InputIterator f, InputIterator l,
                     size_type n = see below,
                     const hasher& hf = hasher(),
                     const key_equal& eql = key_equal(),
                     const allocator_type& a = allocator_type());
unordered_multiset(initializer_list<value_type> il,
                   size_type n = see below,
                   const hasher& hf = hasher(),
                   const key_equal& eql = key_equal(),
                   const allocator_type& a = allocator_type());
```

3 *Effects*: Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns `1.0`.

4 *Complexity*: Average case linear, worst case quadratic.

22.5.7.3 Erasure [unord.multiset.erasure]

```
template<class K, class H, class P, class A, class Predicate>
  typename unordered_multiset<K, H, P, A>::size_type
    erase_if(unordered_multiset<K, H, P, A>& c, Predicate pred);
```

1 *Effects*: Equivalent to:

```
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

22.6 Container adaptors [container.adaptors]

22.6.1 In general [container.adaptors.general]

1 The headers `<queue>` and `<stack>` define the container adaptors `queue`, `priority_queue`, and `stack`.

2 The container adaptors each take a `Container` template parameter, and each constructor takes a `Container` reference argument. This container is copied into the `Container` member of each adaptor. If the container takes an allocator, then a compatible allocator may be passed in to the adaptor's constructor. Otherwise, normal copy or move construction is used for the container argument. The first template parameter `T` of the container adaptors shall denote the same type as `Container::value_type`.

3 For container adaptors, no `swap` function throws an exception unless that exception is thrown by the swap of the adaptor's `Container` or `Compare` object (if any).

4 A deduction guide for a container adaptor shall not participate in overload resolution if any of the following are true:

(4.1) — It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(4.2) — It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

(4.3) — It has a `Container` template parameter and a type that qualifies as an allocator is deduced for that parameter.

(4.4) — It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

(4.5) — It has both `Container` and `Allocator` template parameters, and `uses_allocator_v<Container, Allocator>` is `false`.

22.6.2 Header <queue> synopsis [queue.syn]

```
#include <compare>              // see 17.11.1
#include <initializer_list>     // see 17.10.2

    void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
  template<class T, class Container, class Alloc>
    struct uses_allocator<stack<T, Container>, Alloc>;
}
```

22.6.4 Class template queue [queue]

22.6.4.1 Definition [queue.defn]

1 Any sequence container supporting operations `front()`, `back()`, `push_back()` and `pop_front()` can be used to instantiate `queue`. In particular, `list` (22.3.10) and `deque` (22.3.8) can be used.

```
namespace std {
  template<class T, class Container = deque<T>>
  class queue {
  public:
    using value_type      = typename Container::value_type;
    using reference       = typename Container::reference;
    using const_reference = typename Container::const_reference;
    using size_type       = typename Container::size_type;
    using container_type  =          Container;

  protected:
    Container c;

  public:
    queue() : queue(Container()) {}
    explicit queue(const Container&);
    explicit queue(Container&&);
    template<class Alloc> explicit queue(const Alloc&);
    template<class Alloc> queue(const Container&, const Alloc&);
    template<class Alloc> queue(Container&&, const Alloc&);
    template<class Alloc> queue(const queue&, const Alloc&);
    template<class Alloc> queue(queue&&, const Alloc&);

    [[nodiscard]] bool empty() const    { return c.empty(); }
    size_type         size()  const     { return c.size(); }
    reference         front()           { return c.front(); }
    const_reference   front() const     { return c.front(); }
    reference         back()            { return c.back(); }
    const_reference   back() const      { return c.back(); }
    void push(const value_type& x)      { c.push_back(x); }
    void push(value_type&& x)           { c.push_back(std::move(x)); }
    template<class... Args>
      decltype(auto) emplace(Args&&... args)
        { return c.emplace_back(std::forward<Args>(args)...); }
    void pop()                          { c.pop_front(); }
    void swap(queue& q) noexcept(is_nothrow_swappable_v<Container>)
      { using std::swap; swap(c, q.c); }
  };

  template<class Container>
    queue(Container) -> queue<typename Container::value_type, Container>;
```

```
  template<class Container, class Allocator>
    queue(Container, Allocator) -> queue<typename Container::value_type, Container>;

  template<class T, class Container>
    void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));

  template<class T, class Container, class Alloc>
    struct uses_allocator<queue<T, Container>, Alloc>
      : uses_allocator<Container, Alloc>::type { };
}
```

22.6.4.2 Constructors [queue.cons]

```
explicit queue(const Container& cont);
```

1 *Effects*: Initializes `c` with `cont`.

```
explicit queue(Container&& cont);
```

2 *Effects*: Initializes `c` with `std::move(cont)`.

22.6.4.3 Constructors with allocators [queue.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is `false` the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit queue(const Alloc& a);
```

2 *Effects*: Initializes `c` with `a`.

```
template<class Alloc> queue(const container_type& cont, const Alloc& a);
```

3 *Effects*: Initializes `c` with `cont` as the first argument and `a` as the second argument.

```
template<class Alloc> queue(container_type&& cont, const Alloc& a);
```

4 *Effects*: Initializes `c` with `std::move(cont)` as the first argument and `a` as the second argument.

```
template<class Alloc> queue(const queue& q, const Alloc& a);
```

5 *Effects*: Initializes `c` with `q.c` as the first argument and `a` as the second argument.

```
template<class Alloc> queue(queue&& q, const Alloc& a);
```

6 *Effects*: Initializes `c` with `std::move(q.c)` as the first argument and `a` as the second argument.

22.6.4.4 Operators [queue.ops]

```
template<class T, class Container>
  bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
```

1 *Returns*: `x.c == y.c`.

```
template<class T, class Container>
  bool operator!=(const queue<T, Container>& x,  const queue<T, Container>& y);
```

2 *Returns*: `x.c != y.c`.

```
template<class T, class Container>
  bool operator< (const queue<T, Container>& x, const queue<T, Container>& y);
```

3 *Returns*: `x.c < y.c`.

```
template<class T, class Container>
  bool operator> (const queue<T, Container>& x, const queue<T, Container>& y);
```

4 *Returns*: `x.c > y.c`.

```
template<class T, class Container>
  bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);
```

5 *Returns*: `x.c <= y.c`.

```
template<class T, class Container>
  bool operator>=(const queue<T, Container>& x,
                  const queue<T, Container>& y);
```

6 *Returns*: `x.c >= y.c`.

```
template<class T, three_way_comparable Container>
 compare_three_way_result_t<Container>
  operator<=>(const queue<T, Container>& x, const queue<T, Container>& y);
```

7 *Returns*: `x.c <=> y.c`.

22.6.4.5 Specialized algorithms [queue.special]

```
template<class T, class Container>
 void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints*: `is_swappable_v<Container>` is `true`.

2 *Effects*: As if by `x.swap(y)`.

22.6.5 Class template `priority_queue` [priority.queue]

22.6.5.1 Overview [priqueue.overview]

1 Any sequence container with random access iterator and supporting operations `front()`, `push_back()` and `pop_back()` can be used to instantiate `priority_queue`. In particular, `vector` (22.3.11) and `deque` (22.3.8) can be used. Instantiating `priority_queue` also involves supplying a function or function object for making priority comparisons; the library assumes that the function or function object defines a strict weak ordering (25.8).

```
namespace std {
  template<class T, class Container = vector<T>,
           class Compare = less<typename Container::value_type>>
  class priority_queue {
  public:
    using value_type      = typename Container::value_type;
    using reference       = typename Container::reference;
    using const_reference = typename Container::const_reference;
    using size_type       = typename Container::size_type;
    using container_type  = Container;
    using value_compare   = Compare;

  protected:
    Container c;
    Compare comp;

  public:
    priority_queue() : priority_queue(Compare()) {}
    explicit priority_queue(const Compare& x) : priority_queue(x, Container()) {}
    priority_queue(const Compare& x, const Container&);
    priority_queue(const Compare& x, Container&&);
    template<class InputIterator>
      priority_queue(InputIterator first, InputIterator last, const Compare& x,
                     const Container&);
    template<class InputIterator>
      priority_queue(InputIterator first, InputIterator last,
                     const Compare& x = Compare(), Container&& = Container());
    template<class Alloc> explicit priority_queue(const Alloc&);
    template<class Alloc> priority_queue(const Compare&, const Alloc&);
    template<class Alloc> priority_queue(const Compare&, const Container&, const Alloc&);
    template<class Alloc> priority_queue(const Compare&, Container&&, const Alloc&);
    template<class Alloc> priority_queue(const priority_queue&, const Alloc&);
    template<class Alloc> priority_queue(priority_queue&&, const Alloc&);

    [[nodiscard]] bool empty() const { return c.empty(); }
    size_type size()  const          { return c.size(); }
    const_reference   top() const    { return c.front(); }
```

```
    void push(const value_type& x);
    void push(value_type&& x);
    template<class... Args> void emplace(Args&&... args);
    void pop();
    void swap(priority_queue& q) noexcept(is_nothrow_swappable_v<Container> &&
                                          is_nothrow_swappable_v<Compare>)
      { using std::swap; swap(c, q.c); swap(comp, q.comp); }
  };

  template<class Compare, class Container>
    priority_queue(Compare, Container)
      -> priority_queue<typename Container::value_type, Container, Compare>;

  template<class InputIterator,
           class Compare = less<typename iterator_traits<InputIterator>::value_type>,
           class Container = vector<typename iterator_traits<InputIterator>::value_type>>
    priority_queue(InputIterator, InputIterator, Compare = Compare(), Container = Container())
      -> priority_queue<typename iterator_traits<InputIterator>::value_type, Container, Compare>;

  template<class Compare, class Container, class Allocator>
    priority_queue(Compare, Container, Allocator)
      -> priority_queue<typename Container::value_type, Container, Compare>;

  // no equality is provided

  template<class T, class Container, class Compare>
    void swap(priority_queue<T, Container, Compare>& x,
              priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));

  template<class T, class Container, class Compare, class Alloc>
    struct uses_allocator<priority_queue<T, Container, Compare>, Alloc>
      : uses_allocator<Container, Alloc>::type { };
}
```

22.6.5.2 Constructors [priqueue.cons]

```
priority_queue(const Compare& x, const Container& y);
priority_queue(const Compare& x, Container&& y);
```

1 *Preconditions*: `x` defines a strict weak ordering (25.8).

2 *Effects*: Initializes `comp` with `x` and `c` with `y` (copy constructing or move constructing as appropriate); calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class InputIterator>
  priority_queue(InputIterator first, InputIterator last, const Compare& x, const Container& y);
template<class InputIterator>
  priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare(),
                 Container&& y = Container());
```

3 *Preconditions*: `x` defines a strict weak ordering (25.8).

4 *Effects*: Initializes `comp` with `x` and `c` with `y` (copy constructing or move constructing as appropriate); calls `c.insert(c.end(), first, last)`; and finally calls `make_heap(c.begin(), c.end(), comp)`.

22.6.5.3 Constructors with allocators [priqueue.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is `false` the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit priority_queue(const Alloc& a);
```

2 *Effects*: Initializes `c` with `a` and value-initializes `comp`.

```
template<class Alloc> priority_queue(const Compare& compare, const Alloc& a);
```

3 *Effects*: Initializes `c` with `a` and initializes `comp` with `compare`.

```
template<class Alloc>
  priority_queue(const Compare& compare, const Container& cont, const Alloc& a);
```

4 *Effects*: Initializes `c` with `cont` as the first argument and `a` as the second argument, and initializes `comp` with `compare`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class Alloc>
  priority_queue(const Compare& compare, Container&& cont, const Alloc& a);
```

5 *Effects*: Initializes `c` with `std::move(cont)` as the first argument and `a` as the second argument, and initializes `comp` with `compare`; calls `make_heap(c.begin(), c.end(), comp)`.

```
template<class Alloc> priority_queue(const priority_queue& q, const Alloc& a);
```

6 *Effects*: Initializes `c` with `q.c` as the first argument and `a` as the second argument, and initializes `comp` with `q.comp`.

```
template<class Alloc> priority_queue(priority_queue&& q, const Alloc& a);
```

7 *Effects*: Initializes `c` with `std::move(q.c)` as the first argument and `a` as the second argument, and initializes `comp` with `std::move(q.comp)`.

22.6.5.4 Members [priqueue.members]

```
void push(const value_type& x);
```

1 *Effects*: As if by:

```
c.push_back(x);
push_heap(c.begin(), c.end(), comp);
```

```
void push(value_type&& x);
```

2 *Effects*: As if by:

```
c.push_back(std::move(x));
push_heap(c.begin(), c.end(), comp);
```

```
template<class... Args> void emplace(Args&&... args);
```

3 *Effects*: As if by:

```
c.emplace_back(std::forward<Args>(args)...);
push_heap(c.begin(), c.end(), comp);
```

```
void pop();
```

4 *Effects*: As if by:

```
pop_heap(c.begin(), c.end(), comp);
c.pop_back();
```

22.6.5.5 Specialized algorithms [priqueue.special]

```
template<class T, class Container, class Compare>
  void swap(priority_queue<T, Container, Compare>& x,
            priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints*: `is_swappable_v<Container>` is `true` and `is_swappable_v<Compare>` is `true`.

2 *Effects*: As if by `x.swap(y)`.

22.6.6 Class template stack [stack]

22.6.6.1 General [stack.general]

1 Any sequence container supporting operations `back()`, `push_back()` and `pop_back()` can be used to instantiate `stack`. In particular, `vector` (22.3.11), `list` (22.3.10) and `deque` (22.3.8) can be used.

22.6.6.2 Definition [stack.defn]

```
namespace std {
  template<class T, class Container = deque<T>>
  class stack {
  public:
```

```
    using value_type      = typename Container::value_type;
    using reference       = typename Container::reference;
    using const_reference = typename Container::const_reference;
    using size_type       = typename Container::size_type;
    using container_type  = Container;

  protected:
    Container c;

  public:
    stack() : stack(Container()) {}
    explicit stack(const Container&);
    explicit stack(Container&&);
    template<class Alloc> explicit stack(const Alloc&);
    template<class Alloc> stack(const Container&, const Alloc&);
    template<class Alloc> stack(Container&&, const Alloc&);
    template<class Alloc> stack(const stack&, const Alloc&);
    template<class Alloc> stack(stack&&, const Alloc&);

    [[nodiscard]] bool empty() const    { return c.empty(); }
    size_type size()  const             { return c.size(); }
    reference         top()             { return c.back(); }
    const_reference   top() const       { return c.back(); }
    void push(const value_type& x)      { c.push_back(x); }
    void push(value_type&& x)           { c.push_back(std::move(x)); }
    template<class... Args>
      decltype(auto) emplace(Args&&... args)
        { return c.emplace_back(std::forward<Args>(args)...); }
    void pop()                          { c.pop_back(); }
    void swap(stack& s) noexcept(is_nothrow_swappable_v<Container>)
      { using std::swap; swap(c, s.c); }
  };

  template<class Container>
    stack(Container) -> stack<typename Container::value_type, Container>;

  template<class Container, class Allocator>
    stack(Container, Allocator) -> stack<typename Container::value_type, Container>;

  template<class T, class Container, class Alloc>
    struct uses_allocator<stack<T, Container>, Alloc>
      : uses_allocator<Container, Alloc>::type { };
}
```

22.6.6.3 Constructors [stack.cons]

```
explicit stack(const Container& cont);
```

1 *Effects*: Initializes `c` with `cont`.

```
explicit stack(Container&& cont);
```

2 *Effects*: Initializes `c` with `std::move(cont)`.

22.6.6.4 Constructors with allocators [stack.cons.alloc]

1 If `uses_allocator_v<container_type, Alloc>` is `false` the constructors in this subclause shall not participate in overload resolution.

```
template<class Alloc> explicit stack(const Alloc& a);
```

2 *Effects*: Initializes `c` with `a`.

```
template<class Alloc> stack(const container_type& cont, const Alloc& a);
```

3 *Effects*: Initializes `c` with `cont` as the first argument and `a` as the second argument.

```
template<class Alloc> stack(container_type&& cont, const Alloc& a);
```

4 *Effects*: Initializes `c` with `std::move(cont)` as the first argument and `a` as the second argument.

```
template<class Alloc> stack(const stack& s, const Alloc& a);
```

5 *Effects*: Initializes `c` with `s.c` as the first argument and `a` as the second argument.

```
template<class Alloc> stack(stack&& s, const Alloc& a);
```

6 *Effects*: Initializes `c` with `std::move(s.c)` as the first argument and `a` as the second argument.

22.6.6.5 Operators [stack.ops]

```
template<class T, class Container>
  bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);
```

1 *Returns*: `x.c == y.c`.

```
template<class T, class Container>
  bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);
```

2 *Returns*: `x.c != y.c`.

```
template<class T, class Container>
  bool operator< (const stack<T, Container>& x, const stack<T, Container>& y);
```

3 *Returns*: `x.c < y.c`.

```
template<class T, class Container>
  bool operator> (const stack<T, Container>& x, const stack<T, Container>& y);
```

4 *Returns*: `x.c > y.c`.

```
template<class T, class Container>
  bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);
```

5 *Returns*: `x.c <= y.c`.

```
template<class T, class Container>
    bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);
```

6 *Returns*: `x.c >= y.c`.

```
template<class T, three_way_comparable Container>
  compare_three_way_result_t<Container>
    operator<=>(const stack<T, Container>& x, const stack<T, Container>& y);
```

7 *Returns*: `x.c <=> y.c`.

22.6.6.6 Specialized algorithms [stack.special]

```
template<class T, class Container>
  void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
```

1 *Constraints*: `is_swappable_v<Container>` is `true`.

2 *Effects*: As if by `x.swap(y)`.

22.7 Views [views]

22.7.1 General [views.general]

1 The header `<span>` defines the view `span`.

22.7.2 Header `<span>` synopsis [span.syn]

```
namespace std {
  // constants
  inline constexpr size_t dynamic_extent = numeric_limits<size_t>::max();

  // 22.7.3, class template span
  template<class ElementType, size_t Extent = dynamic_extent>
    class span;
```

```
  template<class ElementType, size_t Extent>
    inline constexpr bool ranges::enable_view<span<ElementType, Extent>> =
      Extent == 0 || Extent == dynamic_extent;
  template<class ElementType, size_t Extent>
    inline constexpr bool ranges::enable_borrowed_range<span<ElementType, Extent>> = true;

  // 22.7.3.8, views of object representation
  template<class ElementType, size_t Extent>
    span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
      as_bytes(span<ElementType, Extent> s) noexcept;

  template<class ElementType, size_t Extent>
    span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
      as_writable_bytes(span<ElementType, Extent> s) noexcept;
}
```

22.7.3 Class template span [views.span]

22.7.3.1 Overview [span.overview]

1 A span is a view over a contiguous sequence of objects, the storage of which is owned by some other object.

2 All member functions of span have constant time complexity.

```
namespace std {
  template<class ElementType, size_t Extent = dynamic_extent>
  class span {
  public:
    // constants and types
    using element_type = ElementType;
    using value_type = remove_cv_t<ElementType>;
    using size_type = size_t;
    using difference_type = ptrdiff_t;
    using pointer = element_type*;
    using const_pointer = const element_type*;
    using reference = element_type&;
    using const_reference = const element_type&;
    using iterator = implementation-defined;        // see 22.7.3.7
    using reverse_iterator = std::reverse_iterator<iterator>;
    static constexpr size_type extent = Extent;

    // 22.7.3.2, constructors, copy, and assignment
    constexpr span() noexcept;
    template<class It>
      constexpr explicit(extent != dynamic_extent) span(It first, size_type count);
    template<class It, class End>
      constexpr explicit(extent != dynamic_extent) span(It first, End last);
    template<size_t N>
      constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
    template<class T, size_t N>
      constexpr span(array<T, N>& arr) noexcept;
    template<class T, size_t N>
      constexpr span(const array<T, N>& arr) noexcept;
    template<class R>
      constexpr explicit(extent != dynamic_extent) span(R&& r);
    constexpr span(const span& other) noexcept = default;
    template<class OtherElementType, size_t OtherExtent>
      constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;

    ~span() noexcept = default;

    constexpr span& operator=(const span& other) noexcept = default;

    // 22.7.3.4, subviews
    template<size_t Count>
      constexpr span<element_type, Count> first() const;
```

```
    template<size_t Count>
      constexpr span<element_type, Count> last() const;
    template<size_t Offset, size_t Count = dynamic_extent>
      constexpr span<element_type, see below> subspan() const;

    constexpr span<element_type, dynamic_extent> first(size_type count) const;
    constexpr span<element_type, dynamic_extent> last(size_type count) const;
    constexpr span<element_type, dynamic_extent> subspan(
      size_type offset, size_type count = dynamic_extent) const;

    // 22.7.3.5, observers
    constexpr size_type size() const noexcept;
    constexpr size_type size_bytes() const noexcept;
    [[nodiscard]] constexpr bool empty() const noexcept;

    // 22.7.3.6, element access
    constexpr reference operator[](size_type idx) const;
    constexpr reference front() const;
    constexpr reference back() const;
    constexpr pointer data() const noexcept;

    constexpr iterator begin() const noexcept;
    constexpr iterator end() const noexcept;
    constexpr reverse_iterator rbegin() const noexcept;
    constexpr reverse_iterator rend() const noexcept;

  private:
    pointer data_;              // exposition only
    size_type size_;            // exposition only
  };

  template<class It, class EndOrSize>
    span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>>;
  template<class T, size_t N>
    span(T (&)[N]) -> span<T, N>;
  template<class T, size_t N>
    span(array<T, N>&) -> span<T, N>;
  template<class T, size_t N>
    span(const array<T, N>&) -> span<const T, N>;
  template<class R>
    span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;
}
```

3 `ElementType` is required to be a complete object type that is not an abstract class type.

22.7.3.2 Constructors, copy, and assignment [span.cons]

```
constexpr span() noexcept;
```

1 *Constraints*: `Extent == dynamic_extent || Extent == 0` is `true`.

2 *Postconditions*: `size() == 0 && data() == nullptr`.

```
template<class It>
  constexpr explicit(extent != dynamic_extent) span(It first, size_type count);
```

3 *Constraints*: Let `U` be `remove_reference_t<iter_reference_t<It>>`.

(3.1) — `It` satisfies `contiguous_iterator`.

(3.2) — `is_convertible_v<U(*)[], element_type(*)[]>` is `true`.

[*Note 1*: The intent is to allow only qualification conversions of the iterator reference type to `element_type`. — *end note*]

4 *Preconditions*:

(4.1) — `[first, first + count)` is a valid range.

(4.2) — It models contiguous_iterator.

(4.3) — If extent is not equal to dynamic_extent, then count is equal to extent.

5 *Effects*: Initializes data_ with to_address(first) and size_ with count.

6 *Throws*: Nothing.

```
template<class It, class End>
  constexpr explicit(extent != dynamic_extent) span(It first, End last);
```

7 *Constraints*: Let U be remove_reference_t<iter_reference_t<It>>.

(7.1) — is_convertible_v<U(*)[], element_type(*)[]> is true.

[*Note 2*: The intent is to allow only qualification conversions of the iterator reference type to element_type. — *end note*]

(7.2) — It satisfies contiguous_iterator.

(7.3) — End satisfies sized_sentinel_for<It>.

(7.4) — is_convertible_v<End, size_t> is false.

8 *Preconditions*:

(8.1) — If extent is not equal to dynamic_extent, then last - first is equal to extent.

(8.2) — [first, last) is a valid range.

(8.3) — It models contiguous_iterator.

(8.4) — End models sized_sentinel_for<It>.

9 *Effects*: Initializes data_ with to_address(first) and size_ with last - first.

10 *Throws*: When and what last - first throws.

```
template<size_t N> constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
template<class T, size_t N> constexpr span(array<T, N>& arr) noexcept;
template<class T, size_t N> constexpr span(const array<T, N>& arr) noexcept;
```

11 *Constraints*: Let U be remove_pointer_t<decltype(data(arr))>.

(11.1) — extent == dynamic_extent || N == extent is true, and

(11.2) — is_convertible_v<U(*)[], element_type(*)[]> is true.

[*Note 3*: The intent is to allow only qualification conversions of the array element type to element_type. — *end note*]

12 *Effects*: Constructs a span that is a view over the supplied array.

[*Note 4*: type_identity_t affects class template argument deduction. — *end note*]

13 *Postconditions*: size() == N && data() == data(arr) is true.

```
template<class R> constexpr explicit(extent != dynamic_extent) span(R&& r);
```

14 *Constraints*: Let U be remove_reference_t<ranges::range_reference_t<R>>.

(14.1) — R satisfies ranges::contiguous_range and ranges::sized_range.

(14.2) — Either R satisfies ranges::borrowed_range or is_const_v<element_type> is true.

(14.3) — remove_cvref_t<R> is not a specialization of span.

(14.4) — remove_cvref_t<R> is not a specialization of array.

(14.5) — is_array_v<remove_cvref_t<R>> is false.

(14.6) — is_convertible_v<U(*)[], element_type(*)[]> is true.

[*Note 5*: The intent is to allow only qualification conversions of the range reference type to element_type. — *end note*]

15 *Preconditions*:

(15.1) — If extent is not equal to dynamic_extent, then ranges::size(r) is equal to extent.

(15.2) — R models ranges::contiguous_range and ranges::sized_range.

(15.3) — If is_const_v<element_type> is false, R models ranges::borrowed_range.

16 *Effects*: Initializes `data_` with `ranges::data(r)` and `size_` with `ranges::size(r)`.

17 *Throws*: What and when `ranges::data(r)` and `ranges::size(r)` throw.

```
constexpr span(const span& other) noexcept = default;
```

18 *Postconditions*: `other.size() == size() && other.data() == data()`.

```
template<class OtherElementType, size_t OtherExtent>
  constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;
```

19 *Constraints*:

(19.1) — `extent == dynamic_extent || OtherExtent == dynamic_extent || extent == OtherExtent` is `true`, and

(19.2) — `is_convertible_v<OtherElementType(*)[], element_type(*)[]>` is `true`.

[*Note 6*: The intent is to allow only qualification conversions of the `OtherElementType` to `element_type`. — *end note*]

20 *Preconditions*: If `extent` is not equal to `dynamic_extent`, then `s.size()` is equal to `extent`.

21 *Effects*: Constructs a `span` that is a view over the range `[s.data(), s.data() + s.size())`.

22 *Postconditions*: `size() == s.size() && data() == s.data()`.

23 *Remarks*: The expression inside `explicit` is equivalent to:

```
extent != dynamic_extent && OtherExtent == dynamic_extent
```

```
constexpr span& operator=(const span& other) noexcept = default;
```

24 *Postconditions*: `size() == other.size() && data() == other.data()`.

22.7.3.3 Deduction guides [span.deduct]

```
template<class It, class EndOrSize>
  span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>>;
```

1 *Constraints*: `It` satisfies `contiguous_iterator`.

```
template<class R>
  span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;
```

2 *Constraints*: `R` satisfies `ranges::contiguous_range`.

22.7.3.4 Subviews [span.sub]

```
template<size_t Count> constexpr span<element_type, Count> first() const;
```

1 *Mandates*: `Count <= Extent` is `true`.

2 *Preconditions*: `Count <= size()` is `true`.

3 *Effects*: Equivalent to: `return R{data(), Count};` where `R` is the return type.

```
template<size_t Count> constexpr span<element_type, Count> last() const;
```

4 *Mandates*: `Count <= Extent` is `true`.

5 *Preconditions*: `Count <= size()` is `true`.

6 *Effects*: Equivalent to: `return R{data() + (size() - Count), Count};` where `R` is the return type.

```
template<size_t Offset, size_t Count = dynamic_extent>
  constexpr span<element_type, see below> subspan() const;
```

7 *Mandates*:

```
Offset <= Extent && (Count == dynamic_extent || Count <= Extent - Offset)
```

is `true`.

8 *Preconditions*:

```
Offset <= size() && (Count == dynamic_extent || Count <= size() - Offset)
```

is `true`.

9 *Effects*: Equivalent to:

```
return span<ElementType, see below>(
  data() + Offset, Count != dynamic_extent ? Count : size() - Offset);
```

10 *Remarks*: The second template argument of the returned `span` type is:

```
Count != dynamic_extent ? Count
                        : (Extent != dynamic_extent ? Extent - Offset
                                                    : dynamic_extent)
```

```
constexpr span<element_type, dynamic_extent> first(size_type count) const;
```

11 *Preconditions*: `count <= size()` is `true`.

12 *Effects*: Equivalent to: `return {data(), count};`

```
constexpr span<element_type, dynamic_extent> last(size_type count) const;
```

13 *Preconditions*: `count <= size()` is `true`.

14 *Effects*: Equivalent to: `return {data() + (size() - count), count};`

```
constexpr span<element_type, dynamic_extent> subspan(
  size_type offset, size_type count = dynamic_extent) const;
```

15 *Preconditions*:

```
offset <= size() && (count == dynamic_extent || count <= size() - offset)
```

is `true`.

16 *Effects*: Equivalent to:

```
return {data() + offset, count == dynamic_extent ? size() - offset : count};
```

22.7.3.5 Observers [span.obs]

```
constexpr size_type size() const noexcept;
```

1 *Effects*: Equivalent to: `return size_;`

```
constexpr size_type size_bytes() const noexcept;
```

2 *Effects*: Equivalent to: `return size() * sizeof(element_type);`

```
[[nodiscard]] constexpr bool empty() const noexcept;
```

3 *Effects*: Equivalent to: `return size() == 0;`

22.7.3.6 Element access [span.elem]

```
constexpr reference operator[](size_type idx) const;
```

1 *Preconditions*: `idx < size()` is `true`.

2 *Effects*: Equivalent to: `return *(data() + idx);`

```
constexpr reference front() const;
```

3 *Preconditions*: `empty()` is `false`.

4 *Effects*: Equivalent to: `return *data();`

```
constexpr reference back() const;
```

5 *Preconditions*: `empty()` is `false`.

6 *Effects*: Equivalent to: `return *(data() + (size() - 1));`

```
constexpr pointer data() const noexcept;
```

7 *Effects*: Equivalent to: `return data_;`

22.7.3.7 Iterator support [span.iterators]

```
using iterator = implementation-defined;
```

1 The type models `contiguous_iterator` (23.3.4.14), meets the *Cpp17RandomAccessIterator* requirements (23.3.5.7), and meets the requirements for constexpr iterators (23.3.1), whose value type is `value_type` and whose reference type is `reference`.

2 All requirements on container iterators (22.2) apply to `span::iterator` as well.

```
constexpr iterator begin() const noexcept;
```

3 *Returns*: An iterator referring to the first element in the span. If `empty()` is `true`, then it returns the same value as `end()`.

```
constexpr iterator end() const noexcept;
```

4 *Returns*: An iterator which is the past-the-end value.

```
constexpr reverse_iterator rbegin() const noexcept;
```

5 *Effects*: Equivalent to: `return reverse_iterator(end());`

```
constexpr reverse_iterator rend() const noexcept;
```

6 *Effects*: Equivalent to: `return reverse_iterator(begin());`

22.7.3.8 Views of object representation [span.objectrep]

```
template<class ElementType, size_t Extent>
  span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
    as_bytes(span<ElementType, Extent> s) noexcept;
```

1 *Effects*: Equivalent to: `return R{reinterpret_cast<const byte*>(s.data()), s.size_bytes()};` where `R` is the return type.

```
template<class ElementType, size_t Extent>
  span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
    as_writable_bytes(span<ElementType, Extent> s) noexcept;
```

2 *Constraints*: `is_const_v<ElementType>` is `false`.

3 *Effects*: Equivalent to: `return R{reinterpret_cast<byte*>(s.data()), s.size_bytes()};` where `R` is the return type.

23 Iterators library [iterators]

23.1 General [iterators.general]

1 This Clause describes components that C++ programs may use to perform iterations over containers (Clause 22), streams (29.7), stream buffers (29.6), and other ranges (Clause 24).

2 The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 82.

Table 82: Iterators library summary [tab:iterators.summary]

	Subclause	Header
23.3	Iterator requirements	`<iterator>`
23.4	Iterator primitives	
23.5	Iterator adaptors	
23.6	Stream iterators	
23.7	Range access	

23.2 Header `<iterator>` synopsis [iterator.synopsis]

```
#include <compare>              // see 17.11.1
#include <concepts>             // see 18.3

}
```

23.3 Iterator requirements [iterator.requirements]

23.3.1 In general [iterator.requirements.general]

1 Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. An input iterator `i` supports the expression `*i`, resulting in a value of some object type `T`, called the *value type* of the iterator. An output iterator `i` has a non-empty set of types that are `indirectly_writable` to the iterator; for each such type `T`, the expression `*i = o` is valid where `o` is a value of type `T`. For every iterator type `X`, there is a corresponding signed integer-like type (23.3.4.4) called the *difference type* of the iterator.

2 Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines six categories of iterators, according to the operations defined on them: *input iterators*, *output iterators*, *forward iterators*, *bidirectional iterators*, *random access iterators*, and *contiguous iterators*, as shown in Table 83.

Table 83: Relations among iterator categories [tab:iterators.relations]

Contiguous	→ **Random Access**	→ **Bidirectional**	→ **Forward**	→ **Input**
				→ **Output**

3 The six categories of iterators correspond to the iterator concepts

(3.1) — `input_iterator` (23.3.4.9),

(3.2) — `output_iterator` (23.3.4.10),

(3.3) — `forward_iterator` (23.3.4.11),

(3.4) — `bidirectional_iterator` (23.3.4.12),

(3.5) — `random_access_iterator` (23.3.4.13), and

(3.6) — `contiguous_iterator` (23.3.4.14),

respectively. The generic term *iterator* refers to any type that models the `input_or_output_iterator` concept (23.3.4.6).

4 Forward iterators meet all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also meet all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also meet all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified; Contiguous iterators also meet all the requirements of random access iterators and can be used whenever a random access iterator is specified.

5 Iterators that further meet the requirements of output iterators are called *mutable iterators*. Nonmutable iterators are referred to as *constant iterators*.

6 In addition to the requirements in this subclause, the nested *typedef-name*s specified in 23.3.2.3 shall be provided for the iterator type.

[*Note 1*: Either the iterator type must provide the *typedef-name*s directly (in which case `iterator_traits` pick them up automatically), or an `iterator_traits` specialization must provide them. — *end note*]

7 Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. Such a value is called a *past-the-end value*. Values of an iterator `i` for which the expression `*i` is defined are called *dereferenceable*. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that meet the *Cpp17DefaultConstructible* requirements, using a value-initialized iterator as the source of a copy or move operation.

[*Note 2*: This guarantee is not offered for default-initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. — *end note*]

In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.

8 Most of the library's algorithmic templates that operate on data structures have interfaces that use ranges. A *range* is an iterator and a *sentinel* that designate the beginning and end of the computation, or an iterator and a count that designate the beginning and the number of elements to which the computation is to be applied.[234]

9 An iterator and a sentinel denoting a range are comparable. A range `[i, s)` is empty if `i == s`; otherwise, `[i, s)` refers to the elements in the data structure starting with the element pointed to by `i` and up to but not including the element, if any, pointed to by the first iterator `j` such that `j == s`.

10 A sentinel `s` is called *reachable from* an iterator `i` if and only if there is a finite sequence of applications of the expression `++i` that makes `i == s`. If `s` is reachable from `i`, `[i, s)` denotes a valid range.

11 A *counted range* `i` + `[0, n)` is empty if `n == 0`; otherwise, `i` + `[0, n)` refers to the `n` elements in the data structure starting with the element pointed to by `i` and up to but not including the element, if any, pointed to by the result of `n` applications of `++i`. A counted range `i` + `[0, n)` is valid if and only if `n == 0`; or `n` is positive, `i` is dereferenceable, and `++i` + `[0, --n)` is valid.

12 The result of the application of library functions to invalid ranges is undefined.

13 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables and concept definitions for the iterators do not specify complexity.

14 Destruction of a non-forward iterator may invalidate pointers and references previously obtained from that iterator.

15 An *invalid iterator* is an iterator that may be singular.[235]

16 Iterators are called *constexpr iterators* if all operations provided to meet iterator category requirements are constexpr functions.

[*Note 3*: For example, the types "pointer to `int`" and `reverse_iterator<int*>` are constexpr iterators. — *end note*]

23.3.2 Associated types [iterator.assoc.types]

23.3.2.1 Incrementable traits [incrementable.traits]

1 To implement algorithms only in terms of incrementable types, it is often necessary to determine the difference type that corresponds to a particular incrementable type. Accordingly, it is required that if `WI` is the name of a type that models the `weakly_incrementable` concept (23.3.4.4), the type

```
iter_difference_t<WI>
```

be defined as the incrementable type's difference type.

```
namespace std {
  template<class> struct incrementable_traits { };

  template<class T>
    requires is_object_v<T>
  struct incrementable_traits<T*> {
    using difference_type = ptrdiff_t;
  };

  template<class I>
  struct incrementable_traits<const I>
    : incrementable_traits<I> { };

  template<class T>
    requires requires { typename T::difference_type; }
```

234) The sentinel denoting the end of a range can have the same type as the iterator denoting the beginning of the range, or a different type.

235) This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.

```
  struct incrementable_traits<T> {
    using difference_type = typename T::difference_type;
  };

  template<class T>
    requires (!requires { typename T::difference_type; } &&
              requires(const T& a, const T& b) { { a - b } -> integral; })
  struct incrementable_traits<T> {
    using difference_type = make_signed_t<decltype(declval<T>() - declval<T>())>;
  };

  template<class T>
    using iter_difference_t = see below;
}
```

2 Let $R_{\mathtt{I}}$ be `remove_cvref_t<I>`. The type `iter_difference_t<I>` denotes

(2.1) — `incrementable_traits<`$R_{\mathtt{I}}$`>::difference_type` if `iterator_traits<`$R_{\mathtt{I}}$`>` names a specialization generated from the primary template, and

(2.2) — `iterator_traits<`$R_{\mathtt{I}}$`>::difference_type` otherwise.

3 Users may specialize `incrementable_traits` on program-defined types.

23.3.2.2 Indirectly readable traits [readable.traits]

1 To implement algorithms only in terms of indirectly readable types, it is often necessary to determine the value type that corresponds to a particular indirectly readable type. Accordingly, it is required that if `R` is the name of a type that models the `indirectly_readable` concept (23.3.4.2), the type

```
iter_value_t<R>
```

be defined as the indirectly readable type's value type.

```
template<class> struct cond-value-type { };      // exposition only
template<class T>
  requires is_object_v<T>
struct cond-value-type<T> {
  using value_type = remove_cv_t<T>;
};

template<class> struct indirectly_readable_traits { };

template<class T>
struct indirectly_readable_traits<T*>
  : cond-value-type<T> { };

template<class I>
  requires is_array_v<I>
struct indirectly_readable_traits<I> {
  using value_type = remove_cv_t<remove_extent_t<I>>;
};

template<class I>
struct indirectly_readable_traits<const I>
  : indirectly_readable_traits<I> { };

template<class T>
  requires requires { typename T::value_type; }
struct indirectly_readable_traits<T>
  : cond-value-type<typename T::value_type> { };

template<class T>
  requires requires { typename T::element_type; }
struct indirectly_readable_traits<T>
  : cond-value-type<typename T::element_type> { };
```

```
template<class T> using iter_value_t = see below;
```

2 Let R_I be `remove_cvref_t<I>`. The type `iter_value_t<I>` denotes

(2.1) — `indirectly_readable_traits<`R_I`>::value_type` if `iterator_traits<`R_I`>` names a specialization generated from the primary template, and

(2.2) — `iterator_traits<`R_I`>::value_type` otherwise.

3 Class template `indirectly_readable_traits` may be specialized on program-defined types.

4 [*Note 1*: Some legacy output iterators define a nested type named `value_type` that is an alias for `void`. These types are not `indirectly_readable` and have no associated value types. — *end note*]

5 [*Note 2*: Smart pointers like `shared_ptr<int>` are `indirectly_readable` and have an associated value type, but a smart pointer like `shared_ptr<void>` is not `indirectly_readable` and has no associated value type. — *end note*]

23.3.2.3 Iterator traits [iterator.traits]

1 To implement algorithms only in terms of iterators, it is sometimes necessary to determine the iterator category that corresponds to a particular iterator type. Accordingly, it is required that if `I` is the type of an iterator, the type

```
iterator_traits<I>::iterator_category
```

be defined as the iterator's iterator category. In addition, the types

```
iterator_traits<I>::pointer
iterator_traits<I>::reference
```

shall be defined as the iterator's pointer and reference types; that is, for an iterator object `a` of class type, the same type as `decltype(a.operator->())` and `decltype(*a)`, respectively. The type `iterator_traits<I>::pointer` shall be `void` for an iterator of class type `I` that does not support `operator->`. Additionally, in the case of an output iterator, the types

```
iterator_traits<I>::value_type
iterator_traits<I>::difference_type
iterator_traits<I>::reference
```

may be defined as `void`.

2 The definitions in this subclause make use of the following exposition-only concepts:

```
template<class I>
concept cpp17-iterator =
  copyable<I> && requires(I i) {
    {   *i } -> can-reference;
    {  ++i } -> same_as<I&>;
    { *i++ } -> can-reference;
  };

template<class I>
concept cpp17-input-iterator =
  cpp17-iterator<I> && equality_comparable<I> && requires(I i) {
    typename incrementable_traits<I>::difference_type;
    typename indirectly_readable_traits<I>::value_type;
    typename common_reference_t<iter_reference_t<I>&&,
                                typename indirectly_readable_traits<I>::value_type&>;
    typename common_reference_t<decltype(*i++)&&,
                                typename indirectly_readable_traits<I>::value_type&>;
    requires signed_integral<typename incrementable_traits<I>::difference_type>;
  };

template<class I>
concept cpp17-forward-iterator =
  cpp17-input-iterator<I> && constructible_from<I> &&
  is_lvalue_reference_v<iter_reference_t<I>> &&
  same_as<remove_cvref_t<iter_reference_t<I>>,
          typename indirectly_readable_traits<I>::value_type> &&
  requires(I i) {
    {  i++ } -> convertible_to<const I&>;
    { *i++ } -> same_as<iter_reference_t<I>>;
```

```
  };

template<class I>
concept cpp17-bidirectional-iterator =
  cpp17-forward-iterator<I> && requires(I i) {
    {  --i } -> same_as<I&>;
    {  i-- } -> convertible_to<const I&>;
    { *i-- } -> same_as<iter_reference_t<I>>;
  };

template<class I>
concept cpp17-random-access-iterator =
  cpp17-bidirectional-iterator<I> && totally_ordered<I> &&
  requires(I i, typename incrementable_traits<I>::difference_type n) {
    { i += n } -> same_as<I&>;
    { i -= n } -> same_as<I&>;
    { i +  n } -> same_as<I>;
    { n +  i } -> same_as<I>;
    { i -  n } -> same_as<I>;
    { i -  i } -> same_as<decltype(n)>;
    {  i[n]  } -> convertible_to<iter_reference_t<I>>;
  };
```

3 The members of a specialization `iterator_traits<I>` generated from the `iterator_traits` primary template are computed as follows:

(3.1) — If `I` has valid (13.10.3) member types `difference_type`, `value_type`, `reference`, and `iterator_category`, then `iterator_traits<I>` has the following publicly accessible members:

```
using iterator_category = typename I::iterator_category;
using value_type        = typename I::value_type;
using difference_type   = typename I::difference_type;
using pointer           = see below;
using reference         = typename I::reference;
```

If the *qualified-id* `I::pointer` is valid and denotes a type, then `iterator_traits<I>::pointer` names that type; otherwise, it names `void`.

(3.2) — Otherwise, if `I` satisfies the exposition-only concept *`cpp17-input-iterator`*, `iterator_traits<I>` has the following publicly accessible members:

```
using iterator_category = see below;
using value_type        = typename indirectly_readable_traits<I>::value_type;
using difference_type   = typename incrementable_traits<I>::difference_type;
using pointer           = see below;
using reference         = see below;
```

(3.2.1) — If the *qualified-id* `I::pointer` is valid and denotes a type, `pointer` names that type. Otherwise, if `decltype(declval<I&>().operator->())` is well-formed, then `pointer` names that type. Otherwise, `pointer` names `void`.

(3.2.2) — If the *qualified-id* `I::reference` is valid and denotes a type, `reference` names that type. Otherwise, `reference` names `iter_reference_t<I>`.

(3.2.3) — If the *qualified-id* `I::iterator_category` is valid and denotes a type, `iterator_category` names that type. Otherwise, `iterator_category` names:

(3.2.3.1) — `random_access_iterator_tag` if `I` satisfies *`cpp17-random-access-iterator`*, or otherwise

(3.2.3.2) — `bidirectional_iterator_tag` if `I` satisfies *`cpp17-bidirectional-iterator`*, or otherwise

(3.2.3.3) — `forward_iterator_tag` if `I` satisfies *`cpp17-forward-iterator`*, or otherwise

(3.2.3.4) — `input_iterator_tag`.

(3.3) — Otherwise, if `I` satisfies the exposition-only concept *`cpp17-iterator`*, then `iterator_traits<I>` has the following publicly accessible members:

```
using iterator_category = output_iterator_tag;
using value_type        = void;
using difference_type   = see below;
```

```
using pointer           = void;
using reference         = void;
```

If the *qualified-id* `incrementable_traits<I>::difference_type` is valid and denotes a type, then `difference_type` names that type; otherwise, it names `void`.

(3.4) — Otherwise, `iterator_traits<I>` has no members by any of the above names.

4 Explicit or partial specializations of `iterator_traits` may have a member type `iterator_concept` that is used to indicate conformance to the iterator concepts (23.3.4).

5 `iterator_traits` is specialized for pointers as

```
namespace std {
  template<class T>
    requires is_object_v<T>
  struct iterator_traits<T*> {
    using iterator_concept  = contiguous_iterator_tag;
    using iterator_category = random_access_iterator_tag;
    using value_type        = remove_cv_t<T>;
    using difference_type   = ptrdiff_t;
    using pointer           = T*;
    using reference         = T&;
  };
}
```

6 [*Example 1*: To implement a generic `reverse` function, a C++ program can do the following:

```
template<class BI>
void reverse(BI first, BI last) {
  typename iterator_traits<BI>::difference_type n =
    distance(first, last);
  --n;
  while(n > 0) {
    typename iterator_traits<BI>::value_type
     tmp = *first;
    *first++ = *--last;
    *last = tmp;
    n -= 2;
  }
}
```

— *end example*]

23.3.3 Customization point objects [iterator.cust]

23.3.3.1 `ranges::iter_move` [iterator.cust.move]

1 The name `ranges::iter_move` denotes a customization point object (16.3.3.3.6). The expression `ranges::iter_move(E)` for a subexpression `E` is expression-equivalent to:

(1.1) — `iter_move(E)`, if `E` has class or enumeration type and `iter_move(E)` is a well-formed expression when treated as an unevaluated operand, with overload resolution performed in a context that does not include a declaration of `ranges::iter_move` but does include the declaration

```
void iter_move();
```

(1.2) — Otherwise, if the expression `*E` is well-formed:

(1.2.1) — if `*E` is an lvalue, `std::move(*E)`;

(1.2.2) — otherwise, `*E`.

(1.3) — Otherwise, `ranges::iter_move(E)` is ill-formed.

[*Note 1*: This case can result in substitution failure when `ranges::iter_move(E)` appears in the immediate context of a template instantiation. — *end note*]

2 If `ranges::iter_move(E)` is not equal to `*E`, the program is ill-formed, no diagnostic required.

23.3.3.2 `ranges::iter_swap` [iterator.cust.swap]

1 The name `ranges::iter_swap` denotes a customization point object (16.3.3.3.6) that exchanges the values (18.4.9) denoted by its arguments.

2 Let *iter-exchange-move* be the exposition-only function:

```
template<class X, class Y>
  constexpr iter_value_t<X> iter-exchange-move(X&& x, Y&& y)
    noexcept(noexcept(iter_value_t<X>(iter_move(x))) &&
             noexcept(*x = iter_move(y)));
```

3 *Effects*: Equivalent to:

```
iter_value_t<X> old_value(iter_move(x));
*x = iter_move(y);
return old_value;
```

4 The expression `ranges::iter_swap(E1, E2)` for subexpressions `E1` and `E2` is expression-equivalent to:

(4.1) — `(void)iter_swap(E1, E2)`, if either `E1` or `E2` has class or enumeration type and `iter_swap(E1, E2)` is a well-formed expression with overload resolution performed in a context that includes the declaration

```
template<class I1, class I2>
  void iter_swap(I1, I2) = delete;
```

and does not include a declaration of `ranges::iter_swap`. If the function selected by overload resolution does not exchange the values denoted by `E1` and `E2`, the program is ill-formed, no diagnostic required.

(4.2) — Otherwise, if the types of `E1` and `E2` each model `indirectly_readable`, and if the reference types of `E1` and `E2` model `swappable_with` (18.4.9), then `ranges::swap(*E1, *E2)`.

(4.3) — Otherwise, if the types `T1` and `T2` of `E1` and `E2` model `indirectly_movable_storable<T1, T2>` and `indirectly_movable_storable<T2, T1>`, then `(void)(*E1 = `*`iter-exchange-move`*`(E2, E1))`, except that `E1` is evaluated only once.

(4.4) — Otherwise, `ranges::iter_swap(E1, E2)` is ill-formed.

[*Note 1*: This case can result in substitution failure when `ranges::iter_swap(E1, E2)` appears in the immediate context of a template instantiation. — *end note*]

23.3.4 Iterator concepts [iterator.concepts]

23.3.4.1 General [iterator.concepts.general]

1 For a type `I`, let *`ITER_TRAITS`*`(I)` denote the type `I` if `iterator_traits<I>` names a specialization generated from the primary template. Otherwise, *`ITER_TRAITS`*`(I)` denotes `iterator_traits<I>`.

(1.1) — If the *qualified-id* *`ITER_TRAITS`*`(I)::iterator_concept` is valid and names a type, then *`ITER_CONCEPT`*`(I)` denotes that type.

(1.2) — Otherwise, if the *qualified-id* *`ITER_TRAITS`*`(I)::iterator_category` is valid and names a type, then *`ITER_CONCEPT`*`(I)` denotes that type.

(1.3) — Otherwise, if `iterator_traits<I>` names a specialization generated from the primary template, then *`ITER_CONCEPT`*`(I)` denotes `random_access_iterator_tag`.

(1.4) — Otherwise, *`ITER_CONCEPT`*`(I)` does not denote a type.

2 [*Note 1*: *`ITER_TRAITS`* enables independent syntactic determination of an iterator's category and concept. — *end note*]

[*Example 1*:

```
struct I {
  using value_type = int;
  using difference_type = int;

  int operator*() const;
  I& operator++();
  I operator++(int);
  I& operator--();
  I operator--(int);

  bool operator==(I) const;
};
```

`iterator_traits<I>::iterator_category` denotes `input_iterator_tag`, and *`ITER_CONCEPT`*`(I)` denotes `random_access_iterator_tag`. — *end example*]

23.3.4.2 Concept `indirectly_readable` [iterator.concept.readable]

1 Types that are indirectly readable by applying `operator*` model the `indirectly_readable` concept, including pointers, smart pointers, and iterators.

```
template<class In>
  concept indirectly-readable-impl =
    requires(const In in) {
      typename iter_value_t<In>;
      typename iter_reference_t<In>;
      typename iter_rvalue_reference_t<In>;
      { *in } -> same_as<iter_reference_t<In>>;
      { ranges::iter_move(in) } -> same_as<iter_rvalue_reference_t<In>>;
    } &&
    common_reference_with<iter_reference_t<In>&&, iter_value_t<In>&> &&
    common_reference_with<iter_reference_t<In>&&, iter_rvalue_reference_t<In>&&> &&
    common_reference_with<iter_rvalue_reference_t<In>&&, const iter_value_t<In>&>;
```

```
template<class In>
  concept indirectly_readable =
    indirectly-readable-impl<remove_cvref_t<In>>;
```

2 Given a value `i` of type `I`, `I` models `indirectly_readable` only if the expression `*i` is equality-preserving. [*Note 1*: The expression `*i` is indirectly required to be valid via the exposition-only ***`dereferenceable`*** concept (23.2). — *end note*]

23.3.4.3 Concept `indirectly_writable` [iterator.concept.writable]

1 The `indirectly_writable` concept specifies the requirements for writing a value into an iterator's referenced object.

```
template<class Out, class T>
  concept indirectly_writable =
    requires(Out&& o, T&& t) {
      *o = std::forward<T>(t);  // not required to be equality-preserving
      *std::forward<Out>(o) = std::forward<T>(t);   // not required to be equality-preserving
      const_cast<const iter_reference_t<Out>&&>(*o) =
        std::forward<T>(t);      // not required to be equality-preserving
      const_cast<const iter_reference_t<Out>&&>(*std::forward<Out>(o)) =
        std::forward<T>(t);      // not required to be equality-preserving
    };
```

2 Let `E` be an expression such that `decltype((E))` is `T`, and let `o` be a dereferenceable object of type `Out`. `Out` and `T` model `indirectly_writable<Out, T>` only if

(2.1) — If `Out` and `T` model `indirectly_readable<Out> && same_as<iter_value_t<Out>, decay_t<T>>`, then `*o` after any above assignment is equal to the value of `E` before the assignment.

3 After evaluating any above assignment expression, `o` is not required to be dereferenceable.

4 If `E` is an xvalue (7.2.1), the resulting state of the object it denotes is valid but unspecified (16.4.6.16).

5 [*Note 1*: The only valid use of an `operator*` is on the left side of the assignment statement. Assignment through the same value of the indirectly writable type happens only once. — *end note*]

6 [*Note 2*: `indirectly_writable` has the awkward `const_cast` expressions to reject iterators with prvalue non-proxy reference types that permit rvalue assignment but do not also permit `const` rvalue assignment. Consequently, an iterator type `I` that returns `std::string` by value does not model `indirectly_writable<I, std::string>`. — *end note*]

23.3.4.4 Concept `weakly_incrementable` [iterator.concept.winc]

1 The `weakly_incrementable` concept specifies the requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be `equality_comparable`.

```
template<class T>
  inline constexpr bool is-integer-like = see below;            // exposition only

template<class T>
  inline constexpr bool is-signed-integer-like = see below;     // exposition only
```

```
template<class I>
  concept weakly_incrementable =
    default_initializable<I> && movable<I> &&
    requires(I i) {
      typename iter_difference_t<I>;
      requires is-signed-integer-like<iter_difference_t<I>>;
      { ++i } -> same_as<I&>;    // not required to be equality-preserving
      i++;                       // not required to be equality-preserving
    };
```

2 A type `I` is an *integer-class type* if it is in a set of implementation-defined class types that behave as integer types do, as defined in below.

3 The range of representable values of an integer-class type is the continuous set of values over which it is defined. The values 0 and 1 are part of the range of every integer-class type. If any negative numbers are part of the range, the type is a *signed-integer-class type*; otherwise, it is an *unsigned-integer-class type*.

4 For every integer-class type `I`, let `B(I)` be a hypothetical extended integer type of the same signedness with the smallest width (6.8.2) capable of representing the same range of values. The width of `I` is equal to the width of `B(I)`.

5 Let `a` and `b` be objects of integer-class type `I`, let `x` and `y` be objects of type `B(I)` as described above that represent the same values as `a` and `b` respectively, and let `c` be an lvalue of any integral type.

(5.1) — For every unary operator `@` for which the expression `@x` is well-formed, `@a` shall also be well-formed and have the same value, effects, and value category as `@x` provided that value is representable by `I`. If `@x` has type `bool`, so too does `@a`; if `@x` has type `B(I)`, then `@a` has type `I`.

(5.2) — For every assignment operator `@=` for which `c @= x` is well-formed, `c @= a` shall also be well-formed and shall have the same value and effects as `c @= x`. The expression `c @= a` shall be an lvalue referring to `c`.

(5.3) — For every binary operator `@` for which `x @ y` is well-formed, `a @ b` shall also be well-formed and shall have the same value, effects, and value category as `x @ y` provided that value is representable by `I`. If `x @ y` has type `bool`, so too does `a @ b`; if `x @ y` has type `B(I)`, then `a @ b` has type `I`.

6 Expressions of integer-class type are explicitly convertible to any integral type. Expressions of integral type are both implicitly and explicitly convertible to any integer-class type. Conversions between integral and integer-class types do not exit via an exception.

7 An expression `E` of integer-class type `I` is contextually convertible to `bool` as if by `bool(E != I(0))`.

8 All integer-class types model `regular` (18.6) and `totally_ordered` (18.5.4).

9 A value-initialized object of integer-class type has value 0.

10 For every (possibly cv-qualified) integer-class type `I`, `numeric_limits<I>` is specialized such that:

(10.1) — `numeric_limits<I>::is_specialized` is `true`,

(10.2) — `numeric_limits<I>::is_signed` is `true` if and only if `I` is a signed-integer-class type,

(10.3) — `numeric_limits<I>::is_integer` is `true`,

(10.4) — `numeric_limits<I>::is_exact` is `true`,

(10.5) — `numeric_limits<I>::digits` is equal to the width of the integer-class type,

(10.6) — `numeric_limits<I>::digits10` is equal to `static_cast<int>(digits * log10(2))`, and

(10.7) — `numeric_limits<I>::min()` and `numeric_limits<I>::max()` return the lowest and highest representable values of `I`, respectively, and `numeric_limits<I>::lowest()` returns `numeric_limits<I>::min()`.

11 A type `I` is *integer-like* if it models `integral<I>` or if it is an integer-class type. A type `I` is *signed-integer-like* if it models `signed_integral<I>` or if it is a signed-integer-class type. A type `I` is *unsigned-integer-like* if it models `unsigned_integral<I>` or if it is an unsigned-integer-class type.

12 *`is-integer-like`*`<I>` is `true` if and only if `I` is an integer-like type. *`is-signed-integer-like`*`<I>` is `true` if and only if `I` is a signed-integer-like type.

13 Let `i` be an object of type `I`. When `i` is in the domain of both pre- and post-increment, `i` is said to be *incrementable*. `I` models `weakly_incrementable<I>` only if

(13.1) — The expressions `++i` and `i++` have the same domain.

(13.2) — If `i` is incrementable, then both `++i` and `i++` advance `i` to the next element.

(13.3) — If `i` is incrementable, then `addressof(++i)` is equal to `addressof(i)`.

14 *Recommended practice*: The implementaton of an algorithm on a weakly incrementable type should never attempt to pass through the same incrementable value twice; such an algorithm should be a single-pass algorithm.

[*Note 1*: For `weakly_incrementable` types, `a` equals `b` does not imply that `++a` equals `++b`. (Equality does not guarantee the substitution property or referential transparency.) Such algorithms can be used with istreams as the source of the input data through the `istream_iterator` class template. — *end note*]

23.3.4.5 Concept `incrementable` [iterator.concept.inc]

1 The `incrementable` concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be `equality_comparable`.

[*Note 1*: This supersedes the annotations on the increment expressions in the definition of `weakly_incrementable`. — *end note*]

```
template<class I>
  concept incrementable =
    regular<I> &&
    weakly_incrementable<I> &&
    requires(I i) {
      { i++ } -> same_as<I>;
    };
```

2 Let `a` and `b` be incrementable objects of type `I`. `I` models `incrementable` only if

(2.1) — If `bool(a == b)` then `bool(a++ == b)`.

(2.2) — If `bool(a == b)` then `bool(((void)a++, a) == ++b)`.

3 [*Note 2*: The requirement that `a` equals `b` implies `++a` equals `++b` (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model `incrementable`. — *end note*]

23.3.4.6 Concept `input_or_output_iterator` [iterator.concept.iterator]

1 The `input_or_output_iterator` concept forms the basis of the iterator concept taxonomy; every iterator models `input_or_output_iterator`. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (23.3.4.7), to read (23.3.4.9) or write (23.3.4.10) values, or to provide a richer set of iterator movements (23.3.4.11, 23.3.4.12, 23.3.4.13).

```
template<class I>
  concept input_or_output_iterator =
    requires(I i) {
      { *i } -> can-reference;
    } &&
    weakly_incrementable<I>;
```

2 [*Note 1*: Unlike the *Cpp17Iterator* requirements, the `input_or_output_iterator` concept does not require copyability. — *end note*]

23.3.4.7 Concept `sentinel_for` [iterator.concept.sentinel]

1 The `sentinel_for` concept specifies the relationship between an `input_or_output_iterator` type and a `semiregular` type whose values denote a range.

```
template<class S, class I>
  concept sentinel_for =
    semiregular<S> &&
    input_or_output_iterator<I> &&
    weakly-equality-comparable-with<S, I>;       // see 18.5.3
```

2 Let `s` and `i` be values of type `S` and `I` such that `[i, s)` denotes a range. Types `S` and `I` model `sentinel_for<S, I>` only if

(2.1) — `i == s` is well-defined.

(2.2) — If `bool(i != s)` then `i` is dereferenceable and `[++i, s)` denotes a range.

3 The domain of `==` is not static. Given an iterator `i` and sentinel `s` such that `[i, s)` denotes a range and `i != s`, `i` and `s` are not required to continue to denote a range after incrementing any other iterator equal to `i`. Consequently, `i == s` is no longer required to be well-defined.

23.3.4.8 Concept `sized_sentinel_for` [iterator.concept.sizedsentinel]

1 The `sized_sentinel_for` concept specifies requirements on an `input_or_output_iterator` type `I` and a corresponding `sentinel_for<I>` that allow the use of the `-` operator to compute the distance between them in constant time.

```
template<class S, class I>
  concept sized_sentinel_for =
    sentinel_for<S, I> &&
    !disable_sized_sentinel_for<remove_cv_t<S>, remove_cv_t<I>> &&
    requires(const I& i, const S& s) {
      { s - i } -> same_as<iter_difference_t<I>>;
      { i - s } -> same_as<iter_difference_t<I>>;
    };
```

2 Let `i` be an iterator of type `I`, and `s` a sentinel of type `S` such that `[i, s)` denotes a range. Let N be the smallest number of applications of `++i` necessary to make `bool(i == s)` be `true`. `S` and `I` model `sized_sentinel_for<S, I>` only if

(2.1) — If N is representable by `iter_difference_t<I>`, then `s - i` is well-defined and equals N.

(2.2) — If $-N$ is representable by `iter_difference_t<I>`, then `i - s` is well-defined and equals $-N$.

```
template<class S, class I>
  inline constexpr bool disable_sized_sentinel_for = false;
```

3 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `disable_sized_sentinel_for` for cv-unqualified non-array object types `S` and `I` if `S` and/or `I` is a program-defined type. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

4 [*Note 1*: `disable_sized_sentinel_for` allows use of sentinels and iterators with the library that satisfy but do not in fact model `sized_sentinel_for`. — *end note*]

5 [*Example 1*: The `sized_sentinel_for` concept is modeled by pairs of `random_access_iterators` (23.3.4.13) and by counted iterators and their sentinels (23.5.6.1). — *end example*]

23.3.4.9 Concept `input_iterator` [iterator.concept.input]

1 The `input_iterator` concept defines requirements for a type whose referenced values can be read (from the requirement for `indirectly_readable` (23.3.4.2)) and which can be both pre- and post-incremented.

[*Note 1*: Unlike the *Cpp17InputIterator* requirements (23.3.5.3), the `input_iterator` concept does not need equality comparison since iterators are typically compared to sentinels. — *end note*]

```
template<class I>
  concept input_iterator =
    input_or_output_iterator<I> &&
    indirectly_readable<I> &&
    requires { typename ITER_CONCEPT(I); } &&
    derived_from<ITER_CONCEPT(I), input_iterator_tag>;
```

23.3.4.10 Concept `output_iterator` [iterator.concept.output]

1 The `output_iterator` concept defines requirements for a type that can be used to write values (from the requirement for `indirectly_writable` (23.3.4.3)) and which can be both pre- and post-incremented.

[*Note 1*: Output iterators are not required to model `equality_comparable`. — *end note*]

```
template<class I, class T>
  concept output_iterator =
    input_or_output_iterator<I> &&
    indirectly_writable<I, T> &&
    requires(I i, T&& t) {
      *i++ = std::forward<T>(t);        // not required to be equality-preserving
    };
```

2 Let `E` be an expression such that `decltype((E))` is `T`, and let `i` be a dereferenceable object of type `I`. `I` and `T` model `output_iterator<I, T>` only if `*i++ = E;` has effects equivalent to:

```
*i = E;
++i;
```

3 *Recommended practice*: The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

23.3.4.11 Concept `forward_iterator` [iterator.concept.forward]

1 The `forward_iterator` concept adds copyability, equality comparison, and the multi-pass guarantee, specified below.

```
template<class I>
  concept forward_iterator =
    input_iterator<I> &&
    derived_from<ITER_CONCEPT(I), forward_iterator_tag> &&
    incrementable<I> &&
    sentinel_for<I, I>;
```

2 The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type.

[*Note 1*: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — *end note*]

3 Pointers and references obtained from a forward iterator into a range `[i, s)` shall remain valid while `[i, s)` continues to denote a range.

4 Two dereferenceable iterators `a` and `b` of type `X` offer the *multi-pass guarantee* if:

(4.1) — `a == b` implies `++a == ++b` and

(4.2) — the expression `((void)[](X x){++x;}(a), *a)` is equivalent to the expression `*a`.

5 [*Note 2*: The requirement that `a == b` implies `++a == ++b` and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators. — *end note*]

23.3.4.12 Concept `bidirectional_iterator` [iterator.concept.bidir]

1 The `bidirectional_iterator` concept adds the ability to move an iterator backward as well as forward.

```
template<class I>
  concept bidirectional_iterator =
    forward_iterator<I> &&
    derived_from<ITER_CONCEPT(I), bidirectional_iterator_tag> &&
    requires(I i) {
      { --i } -> same_as<I&>;
      { i-- } -> same_as<I>;
    };
```

2 A bidirectional iterator `r` is decrementable if and only if there exists some `q` such that `++q == r`. Decrementable iterators `r` shall be in the domain of the expressions `--r` and `r--`.

3 Let `a` and `b` be equal objects of type `I`. `I` models `bidirectional_iterator` only if:

(3.1) — If `a` and `b` are decrementable, then all of the following are `true`:

(3.1.1) — `addressof(--a) == addressof(a)`

(3.1.2) — `bool(a-- == b)`

(3.1.3) — after evaluating both `a--` and `--b`, `bool(a == b)` is still `true`

(3.1.4) — `bool(++(--a) == b)`

(3.2) — If `a` and `b` are incrementable, then `bool(--(++a) == b)`.

23.3.4.13 Concept `random_access_iterator` [iterator.concept.random.access]

1 The `random_access_iterator` concept adds support for constant-time advancement with `+=`, `+`, `-=`, and `-`, as well as the computation of distance in constant time with `-`. Random access iterators also support array notation via subscripting.

```
template<class I>
  concept random_access_iterator =
    bidirectional_iterator<I> &&
    derived_from<ITER_CONCEPT(I), random_access_iterator_tag> &&
    totally_ordered<I> &&
    sized_sentinel_for<I, I> &&
    requires(I i, const I j, const iter_difference_t<I> n) {
      { i += n } -> same_as<I&>;
      { j +  n } -> same_as<I>;
      { n +  j } -> same_as<I>;
      { i -= n } -> same_as<I&>;
      { j -  n } -> same_as<I>;
      {  j[n]  } -> same_as<iter_reference_t<I>>;
    };
```

2 Let `a` and `b` be valid iterators of type `I` such that `b` is reachable from `a` after `n` applications of `++a`, let `D` be `iter_difference_t<I>`, and let `n` denote a value of type `D`. `I` models `random_access_iterator` only if

(2.1) — `(a += n)` is equal to `b`.

(2.2) — `addressof(a += n)` is equal to `addressof(a)`.

(2.3) — `(a + n)` is equal to `(a += n)`.

(2.4) — For any two positive values `x` and `y` of type `D`, if `(a + D(x + y))` is valid, then `(a + D(x + y))` is equal to `((a + x) + y)`.

(2.5) — `(a + D(0))` is equal to `a`.

(2.6) — If `(a + D(n - 1))` is valid, then `(a + n)` is equal to `[](I c){ return ++c; }(a + D(n - 1))`.

(2.7) — `(b += D(-n))` is equal to `a`.

(2.8) — `(b -= n)` is equal to `a`.

(2.9) — `addressof(b -= n)` is equal to `addressof(b)`.

(2.10) — `(b - n)` is equal to `(b -= n)`.

(2.11) — If `b` is dereferenceable, then `a[n]` is valid and is equal to `*b`.

(2.12) — `bool(a <= b)` is `true`.

23.3.4.14 Concept `contiguous_iterator` [iterator.concept.contiguous]

1 The `contiguous_iterator` concept provides a guarantee that the denoted elements are stored contiguously in memory.

```
template<class I>
  concept contiguous_iterator =
    random_access_iterator<I> &&
    derived_from<ITER_CONCEPT(I), contiguous_iterator_tag> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<iter_value_t<I>, remove_cvref_t<iter_reference_t<I>>> &&
    requires(const I& i) {
      { to_address(i) } -> same_as<add_pointer_t<iter_reference_t<I>>>;
    };
```

2 Let `a` and `b` be dereferenceable iterators and `c` be a non-dereferenceable iterator of type `I` such that `b` is reachable from `a` and `c` is reachable from `b`, and let `D` be `iter_difference_t<I>`. The type `I` models `contiguous_iterator` only if

(2.1) — `to_address(a) == addressof(*a)`,

(2.2) — `to_address(b) == to_address(a) + D(b - a)`, and

(2.3) — `to_address(c) == to_address(a) + D(c - a)`.

23.3.5 C++17 iterator requirements [iterator.cpp17]

23.3.5.1 General [iterator.cpp17.general]

1 In the following sections, `a` and `b` denote values of type `X` or `const X`, `difference_type` and `reference` refer to the types `iterator_traits<X>::difference_type` and `iterator_traits<X>::reference`, respectively,

n denotes a value of `difference_type`, `u`, `tmp`, and `m` denote identifiers, `r` denotes a value of `X&`, `t` denotes a value of value type `T`, `o` denotes a value of some type that is writable to the output iterator.

[*Note 1*: For an iterator type `X` there must be an instantiation of `iterator_traits<X>` (23.3.2.3). — *end note*]

23.3.5.2 *Cpp17Iterator* [iterator.iterators]

1 The *Cpp17Iterator* requirements form the basis of the iterator taxonomy; every iterator meets the *Cpp17Iterator* requirements. This set of requirements specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to read (23.3.5.3) or write (23.3.5.4) values, or to provide a richer set of iterator movements (23.3.5.5, 23.3.5.6, 23.3.5.7).

2 A type `X` meets the *Cpp17Iterator* requirements if:

(2.1) — `X` meets the *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17Destructible* requirements (16.4.4.2) and lvalues of type `X` are swappable (16.4.4.3), and

(2.2) — `iterator_traits<X>::difference_type` is a signed integer type or `void`, and

(2.3) — the expressions in Table 84 are valid and have the indicated semantics.

Table 84: *Cpp17Iterator* requirements [tab:iterator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`*r`	unspecified		*Preconditions*: `r` is dereferenceable.
`++r`	`X&`		

23.3.5.3 Input iterators [input.iterators]

1 A class or pointer type `X` meets the requirements of an input iterator for the value type `T` if `X` meets the *Cpp17Iterator* (23.3.5.2) and *Cpp17EqualityComparable* (Table 25) requirements and the expressions in Table 85 are valid and have the indicated semantics.

2 In Table 85, the term *the domain of* `==` is used in the ordinary mathematical sense to denote the set of values over which `==` is (required to be) defined. This set can change over time. Each algorithm places additional requirements on the domain of `==` for the iterator values it uses. These requirements can be inferred from the uses that algorithm makes of `==` and `!=`.

[*Example 1*: The call `find(a,b,x)` is defined only if the value of `a` has the property *p* defined as follows: `b` has property *p* and a value `i` has property *p* if (`*i==x`) or if (`*i!=x` and `++i` has property *p*). — *end example*]

Table 85: *Cpp17InputIterator* requirements (in addition to *Cpp17Iterator*) [tab:inputiterator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`a != b`	contextually convertible to `bool`	`!(a == b)`	*Preconditions*: `(a, b)` is in the domain of `==`.
`*a`	`reference`, convertible to `T`		*Preconditions*: `a` is dereferenceable. The expression `(void)*a, *a` is equivalent to `*a`. If `a == b` and `(a, b)` is in the domain of `==` then `*a` is equivalent to `*b`.
`a->m`		`(*a).m`	*Preconditions*: `a` is dereferenceable.

Table 85: *Cpp17InputIterator* requirements (in addition to *Cpp17Iterator*) (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`++r`	`X&`		*Preconditions*: `r` is dereferenceable. *Postconditions*: `r` is dereferenceable or `r` is past-the-end; any copies of the previous value of `r` are no longer required to be dereferenceable nor to be in the domain of `==`.
`(void)r++`			equivalent to `(void)++r`

`*r++`	convertible to `T`	`{ T tmp = *r;`
		`++r;`
		`return tmp; }`	

3 *Recommended practice*: The implementation of an algorithm on input iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single pass algorithm.

[*Note 1*: For input iterators, `a == b` does not imply `++a == ++b`. (Equality does not guarantee the substitution property or referential transparency.) Value type `T` is not required to be a *Cpp17CopyAssignable* type (Table 31). Such an algorithm can be used with istreams as the source of the input data through the `istream_iterator` class template. — *end note*]

23.3.5.4 Output iterators [output.iterators]

1 A class or pointer type `X` meets the requirements of an output iterator if `X` meets the *Cpp17Iterator* requirements (23.3.5.2) and the expressions in Table 86 are valid and have the indicated semantics.

Table 86: *Cpp17OutputIterator* requirements (in addition to *Cpp17Iterator*) [tab:outputiterator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`*r = o`	result is not used		*Remarks*: After this operation `r` is not required to be dereferenceable. *Postconditions*: `r` is incrementable.
`++r`	`X&`		`addressof(r) == addressof(++r)`. *Remarks*: After this operation `r` is not required to be dereferenceable. *Postconditions*: `r` is incrementable.

`r++`	convertible to `const X&`	`{ X tmp = r;`
		`++r;`
		`return tmp; }`
			Remarks: After this operation `r` is not required to be dereferenceable.
			Postconditions: `r` is incrementable.

`*r++ = o`	result is not used		*Remarks*: After this operation `r` is not required to be dereferenceable. *Postconditions*: `r` is incrementable.

2 *Recommended practice*: The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

[*Note 1*: The only valid use of an `operator*` is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Equality and inequality might not be defined. — *end note*]

23.3.5.5 Forward iterators [forward.iterators]

1 A class or pointer type `X` meets the requirements of a forward iterator if

(1.1) — `X` meets the *Cpp17InputIterator* requirements (23.3.5.3),

(1.2) — `X` meets the *Cpp17DefaultConstructible* requirements (16.4.4.2),

(1.3) — if `X` is a mutable iterator, `reference` is a reference to `T`; if `X` is a constant iterator, `reference` is a reference to `const T`,

(1.4) — the expressions in Table 87 are valid and have the indicated semantics, and

(1.5) — objects of type `X` offer the multi-pass guarantee, described below.

2 The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the same type.

[*Note 1*: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — *end note*]

3 Two dereferenceable iterators `a` and `b` of type `X` offer the *multi-pass guarantee* if:

(3.1) — `a == b` implies `++a == ++b` and

(3.2) — `X` is a pointer type or the expression `(void)++X(a), *a` is equivalent to the expression `*a`.

4 [*Note 2*: The requirement that `a == b` implies `++a == ++b` (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators. — *end note*]

Table 87: *Cpp17ForwardIterator* requirements (in addition to *Cpp17InputIterator*) [tab:forwarditerator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`r++`	convertible to `const X&`	`{ X tmp = r;` `++r;` `return tmp; }`	
`*r++`	`reference`		

5 If `a` and `b` are equal, then either `a` and `b` are both dereferenceable or else neither is dereferenceable.

6 If `a` and `b` are both dereferenceable, then `a == b` if and only if `*a` and `*b` are bound to the same object.

23.3.5.6 Bidirectional iterators [bidirectional.iterators]

1 A class or pointer type `X` meets the requirements of a bidirectional iterator if, in addition to meeting the *Cpp17ForwardIterator* requirements, the following expressions are valid as shown in Table 88.

2 [*Note 1*: Bidirectional iterators allow algorithms to move iterators backward as well as forward. — *end note*]

23.3.5.7 Random access iterators [random.access.iterators]

1 A class or pointer type `X` meets the requirements of a random access iterator if, in addition to meeting the *Cpp17BidirectionalIterator* requirements, the following expressions are valid as shown in Table 89.

Table 88: *Cpp17BidirectionalIterator* requirements (in addition to *Cpp17ForwardIterator*) [tab:bidirectionaliterator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`--r`	`X&`		*Preconditions*: there exists `s` such that `r == ++s`. *Postconditions*: `r` is dereferenceable. `--(++r) == r`. `--r == --s` implies `r == s`. `addressof(r) == addressof(--r)`.

`r--`	convertible to `const X&`	`{ X tmp = r;`
		`--r;`
		`return tmp; }`	

`*r--`	`reference`		

Table 89: *Cpp17RandomAccessIterator* requirements (in addition to *Cpp17BidirectionalIterator*) [tab:randomaccessiterator]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition

`r += n`	`X&`	`{ difference_type m = n;`
		`if (m >= 0)`
		`while (m--)`
		`++r;`
		`else`
		`while (m++)`
		`--r;`
		`return r; }`	

`a + n` `n + a`	`X`	`{ X tmp = a;` `return tmp += n; }`	`a + n == n + a`.
`r -= n`	`X&`	`return r += -n;`	*Preconditions*: the absolute value of `n` is in the range of representable values of `difference_type`.
`a - n`	`X`	`{ X tmp = a;` `return tmp -= n; }`	
`b - a`	`difference_-type`	`return n`	*Preconditions*: there exists a value `n` of type `difference_type` such that `a + n == b`. `b == a + (b - a)`.
`a[n]`	convertible to `reference`	`*(a + n)`	
`a < b`	contextually convertible to `bool`	`b - a > 0`	`<` is a total ordering relation
`a > b`	contextually convertible to `bool`	`b < a`	`>` is a total ordering relation opposite to `<`.
`a >= b`	contextually convertible to `bool`	`!(a < b)`	

Table 89: *Cpp17RandomAccessIterator* requirements (in addition to *Cpp17BidirectionalIterator*) (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
`a <= b`	contextually convertible to `bool`.	`!(a > b)`	

23.3.6 Indirect callable requirements [indirectcallable]

23.3.6.1 General [indirectcallable.general]

1 There are several concepts that group requirements of algorithms that take callable objects (20.14.3) as arguments.

23.3.6.2 Indirect callables [indirectcallable.indirectinvocable]

1 The indirect callable concepts are used to constrain those algorithms that accept callable objects (20.14.3) as arguments.

```
namespace std {
  template<class F, class I>
    concept indirectly_unary_invocable =
      indirectly_readable<I> &&
      copy_constructible<F> &&
      invocable<F&, iter_value_t<I>&> &&
      invocable<F&, iter_reference_t<I>> &&
      invocable<F&, iter_common_reference_t<I>> &&
      common_reference_with<
        invoke_result_t<F&, iter_value_t<I>&>,
        invoke_result_t<F&, iter_reference_t<I>>>;

  template<class F, class I>
    concept indirectly_regular_unary_invocable =
      indirectly_readable<I> &&
      copy_constructible<F> &&
      regular_invocable<F&, iter_value_t<I>&> &&
      regular_invocable<F&, iter_reference_t<I>> &&
      regular_invocable<F&, iter_common_reference_t<I>> &&
      common_reference_with<
        invoke_result_t<F&, iter_value_t<I>&>,
        invoke_result_t<F&, iter_reference_t<I>>>;

  template<class F, class I>
    concept indirect_unary_predicate =
      indirectly_readable<I> &&
      copy_constructible<F> &&
      predicate<F&, iter_value_t<I>&> &&
      predicate<F&, iter_reference_t<I>> &&
      predicate<F&, iter_common_reference_t<I>>;

  template<class F, class I1, class I2>
    concept indirect_binary_predicate =
      indirectly_readable<I1> && indirectly_readable<I2> &&
      copy_constructible<F> &&
      predicate<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
      predicate<F&, iter_value_t<I1>&, iter_reference_t<I2>> &&
      predicate<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
      predicate<F&, iter_reference_t<I1>, iter_reference_t<I2>> &&
      predicate<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;

  template<class F, class I1, class I2 = I1>
    concept indirect_equivalence_relation =
      indirectly_readable<I1> && indirectly_readable<I2> &&
      copy_constructible<F> &&
      equivalence_relation<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
```

```
      equivalence_relation<F&, iter_value_t<I1>&, iter_reference_t<I2>> &&
      equivalence_relation<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
      equivalence_relation<F&, iter_reference_t<I1>, iter_reference_t<I2>> &&
      equivalence_relation<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;

  template<class F, class I1, class I2 = I1>
    concept indirect_strict_weak_order =
      indirectly_readable<I1> && indirectly_readable<I2> &&
      copy_constructible<F> &&
      strict_weak_order<F&, iter_value_t<I1>&, iter_value_t<I2>&> &&
      strict_weak_order<F&, iter_value_t<I1>&, iter_reference_t<I2>> &&
      strict_weak_order<F&, iter_reference_t<I1>, iter_value_t<I2>&> &&
      strict_weak_order<F&, iter_reference_t<I1>, iter_reference_t<I2>> &&
      strict_weak_order<F&, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;
}
```

23.3.6.3 Class template projected [projected]

1 Class template `projected` is used to constrain algorithms that accept callable objects and projections (3.44). It combines a `indirectly_readable` type `I` and a callable object type `Proj` into a new `indirectly_readable` type whose `reference` type is the result of applying `Proj` to the `iter_reference_t` of `I`.

```
namespace std {
  template<indirectly_readable I, indirectly_regular_unary_invocable<I> Proj>
  struct projected {
    using value_type = remove_cvref_t<indirect_result_t<Proj&, I>>;
    indirect_result_t<Proj&, I> operator*() const;              // not defined
  };

  template<weakly_incrementable I, class Proj>
  struct incrementable_traits<projected<I, Proj>> {
    using difference_type = iter_difference_t<I>;
  };
}
```

23.3.7 Common algorithm requirements [alg.req]

23.3.7.1 General [alg.req.general]

1 There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are three relational concepts that specify how element values are transferred between `indirectly_readable` and `indirectly_writable` types: `indirectly_movable`, `indirectly_copyable`, and `indirectly_swappable`. There are three relational concepts for rearrangements: `permutable`, `mergeable`, and `sortable`. There is one relational concept for comparing values from different sequences: `indirectly_comparable`.

2 [*Note 1*: The `ranges::less` function object type used in the concepts below imposes constraints on the concepts' arguments in addition to those that appear in the concepts' bodies (20.14.9). — *end note*]

23.3.7.2 Concept indirectly_movable [alg.req.ind.move]

1 The `indirectly_movable` concept specifies the relationship between a `indirectly_readable` type and a `indirectly_writable` type between which values may be moved.

```
template<class In, class Out>
  concept indirectly_movable =
    indirectly_readable<In> &&
    indirectly_writable<Out, iter_rvalue_reference_t<In>>;
```

2 The `indirectly_movable_storable` concept augments `indirectly_movable` with additional requirements enabling the transfer to be performed through an intermediate object of the `indirectly_readable` type's value type.

```
template<class In, class Out>
  concept indirectly_movable_storable =
    indirectly_movable<In, Out> &&
    indirectly_writable<Out, iter_value_t<In>> &&
    movable<iter_value_t<In>> &&
    constructible_from<iter_value_t<In>, iter_rvalue_reference_t<In>> &&
```

```
      assignable_from<iter_value_t<In>&, iter_rvalue_reference_t<In>>;
```

3 Let `i` be a dereferenceable value of type `In`. `In` and `Out` model `indirectly_movable_storable<In, Out>` only if after the initialization of the object `obj` in

```
iter_value_t<In> obj(ranges::iter_move(i));
```

`obj` is equal to the value previously denoted by `*i`. If `iter_rvalue_reference_t<In>` is an rvalue reference type, the resulting state of the value denoted by `*i` is valid but unspecified (16.4.6.16).

23.3.7.3 Concept `indirectly_copyable` [alg.req.ind.copy]

1 The `indirectly_copyable` concept specifies the relationship between a `indirectly_readable` type and a `indirectly_writable` type between which values may be copied.

```
template<class In, class Out>
  concept indirectly_copyable =
    indirectly_readable<In> &&
    indirectly_writable<Out, iter_reference_t<In>>;
```

2 The `indirectly_copyable_storable` concept augments `indirectly_copyable` with additional requirements enabling the transfer to be performed through an intermediate object of the `indirectly_readable` type's value type. It also requires the capability to make copies of values.

```
template<class In, class Out>
  concept indirectly_copyable_storable =
    indirectly_copyable<In, Out> &&
    indirectly_writable<Out, iter_value_t<In>&> &&
    indirectly_writable<Out, const iter_value_t<In>&> &&
    indirectly_writable<Out, iter_value_t<In>&&> &&
    indirectly_writable<Out, const iter_value_t<In>&&> &&
    copyable<iter_value_t<In>> &&
    constructible_from<iter_value_t<In>, iter_reference_t<In>> &&
    assignable_from<iter_value_t<In>&, iter_reference_t<In>>;
```

3 Let `i` be a dereferenceable value of type `In`. `In` and `Out` model `indirectly_copyable_storable<In, Out>` only if after the initialization of the object `obj` in

```
iter_value_t<In> obj(*i);
```

`obj` is equal to the value previously denoted by `*i`. If `iter_reference_t<In>` is an rvalue reference type, the resulting state of the value denoted by `*i` is valid but unspecified (16.4.6.16).

23.3.7.4 Concept `indirectly_swappable` [alg.req.ind.swap]

1 The `indirectly_swappable` concept specifies a swappable relationship between the values referenced by two `indirectly_readable` types.

```
template<class I1, class I2 = I1>
  concept indirectly_swappable =
    indirectly_readable<I1> && indirectly_readable<I2> &&
    requires(const I1 i1, const I2 i2) {
      ranges::iter_swap(i1, i1);
      ranges::iter_swap(i2, i2);
      ranges::iter_swap(i1, i2);
      ranges::iter_swap(i2, i1);
    };
```

23.3.7.5 Concept `indirectly_comparable` [alg.req.ind.cmp]

1 The `indirectly_comparable` concept specifies the common requirements of algorithms that compare values from two different sequences.

```
template<class I1, class I2, class R, class P1 = identity,
         class P2 = identity>
  concept indirectly_comparable =
    indirect_binary_predicate<R, projected<I1, P1>, projected<I2, P2>>;
```

23.3.7.6 Concept `permutable` [alg.req.permutable]

1 The `permutable` concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

```
template<class I>
  concept permutable =
    forward_iterator<I> &&
    indirectly_movable_storable<I, I> &&
    indirectly_swappable<I, I>;
```

23.3.7.7 Concept mergeable [alg.req.mergeable]

1 The mergeable concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

```
template<class I1, class I2, class Out, class R = ranges::less,
         class P1 = identity, class P2 = identity>
  concept mergeable =
    input_iterator<I1> &&
    input_iterator<I2> &&
    weakly_incrementable<Out> &&
    indirectly_copyable<I1, Out> &&
    indirectly_copyable<I2, Out> &&
    indirect_strict_weak_order<R, projected<I1, P1>, projected<I2, P2>>;
```

23.3.7.8 Concept sortable [alg.req.sortable]

1 The sortable concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., sort).

```
template<class I, class R = ranges::less, class P = identity>
  concept sortable =
    permutable<I> &&
    indirect_strict_weak_order<R, projected<I, P>>;
```

23.4 Iterator primitives [iterator.primitives]

23.4.1 General [iterator.primitives.general]

1 To simplify the use of iterators, the library provides several classes and functions.

23.4.2 Standard iterator tags [std.iterator.tags]

1 It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces *category tag* classes which are used as compile time tags for algorithm selection. They are: output_iterator_tag, input_iterator_tag, forward_iterator_tag, bidirectional_iterator_tag, random_access_iterator_tag, and contiguous_iterator_tag. For every iterator of type I, iterator_traits<I>::iterator_category shall be defined to be a category tag that describes the iterator's behavior. Additionally, iterator_traits<I>::iterator_concept may be used to indicate conformance to the iterator concepts (23.3.4).

```
namespace std {
  struct output_iterator_tag { };
  struct input_iterator_tag { };
  struct forward_iterator_tag: public input_iterator_tag { };
  struct bidirectional_iterator_tag: public forward_iterator_tag { };
  struct random_access_iterator_tag: public bidirectional_iterator_tag { };
  struct contiguous_iterator_tag: public random_access_iterator_tag { };
}
```

2 [*Example 1*: For a program-defined iterator BinaryTreeIterator, it could be included into the bidirectional iterator category by specializing the iterator_traits template:

```
template<class T> struct iterator_traits<BinaryTreeIterator<T>> {
  using iterator_category = bidirectional_iterator_tag;
  using difference_type   = ptrdiff_t;
  using value_type        = T;
  using pointer           = T*;
  using reference         = T&;
};
```

— *end example*]

3 [*Example 2*: If `evolve()` is well-defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:

```
template<class BidirectionalIterator>
inline void
evolve(BidirectionalIterator first, BidirectionalIterator last) {
  evolve(first, last,
    typename iterator_traits<BidirectionalIterator>::iterator_category());
}

template<class BidirectionalIterator>
void evolve(BidirectionalIterator first, BidirectionalIterator last,
  bidirectional_iterator_tag) {
  // more generic, but less efficient algorithm
}

template<class RandomAccessIterator>
void evolve(RandomAccessIterator first, RandomAccessIterator last,
  random_access_iterator_tag) {
  // more efficient, but less generic algorithm
}
```

— *end example*]

23.4.3 Iterator operations [iterator.operations]

1 Since only random access iterators provide `+` and `-` operators, the library provides two function templates `advance` and `distance`. These function templates use `+` and `-` for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use `++` to provide linear time implementations.

```
template<class InputIterator, class Distance>
  constexpr void advance(InputIterator& i, Distance n);
```

2 *Preconditions*: `n` is negative only for bidirectional iterators.

3 *Effects*: Increments `i` by `n` if `n` is non-negative, and decrements `i` by `-n` otherwise.

```
template<class InputIterator>
  constexpr typename iterator_traits<InputIterator>::difference_type
    distance(InputIterator first, InputIterator last);
```

4 *Preconditions*: `last` is reachable from `first`, or `InputIterator` meets the *Cpp17RandomAccessIterator* requirements and `first` is reachable from `last`.

5 *Effects*: If `InputIterator` meets the *Cpp17RandomAccessIterator* requirements, returns `(last - first)`; otherwise, returns the number of increments needed to get from `first` to `last`.

```
template<class InputIterator>
  constexpr InputIterator next(InputIterator x,
    typename iterator_traits<InputIterator>::difference_type n = 1);
```

6 *Effects*: Equivalent to: `advance(x, n); return x;`

```
template<class BidirectionalIterator>
  constexpr BidirectionalIterator prev(BidirectionalIterator x,
    typename iterator_traits<BidirectionalIterator>::difference_type n = 1);
```

7 *Effects*: Equivalent to: `advance(x, -n); return x;`

23.4.4 Range iterator operations [range.iter.ops]

23.4.4.1 General [range.iter.ops.general]

1 The library includes the function templates `ranges::advance`, `ranges::distance`, `ranges::next`, and `ranges::prev` to manipulate iterators. These operations adapt to the set of operators provided by each iterator category to provide the most efficient implementation possible for a concrete iterator type.

[*Example 1*: `ranges::advance` uses the `+` operator to move a `random_access_iterator` forward `n` steps in constant time. For an iterator type that does not model `random_access_iterator`, `ranges::advance` instead performs `n` individual increments with the `++` operator. — *end example*]

2 The function templates defined in 23.4.4 are not found by argument-dependent name lookup (6.5.3). When found by unqualified (6.5.2) name lookup for the *postfix-expression* in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

[*Example 2*:

```
void foo() {
    using namespace std::ranges;
    std::vector<int> vec{1,2,3};
    distance(begin(vec), end(vec));      // #1
}
```

The function call expression at `#1` invokes `std::ranges::distance`, not `std::distance`, despite that (a) the iterator type returned from `begin(vec)` and `end(vec)` may be associated with namespace `std` and (b) `std::distance` is more specialized (13.7.7.3) than `std::ranges::distance` since the former requires its first two parameters to have the same type. — *end example*]

3 The number and order of deducible template parameters for the function templates defined in 23.4.4 is unspecified, except where explicitly stated otherwise.

23.4.4.2 `ranges::advance` [range.iter.op.advance]

```
template<input_or_output_iterator I>
  constexpr void ranges::advance(I& i, iter_difference_t<I> n);
```

1 *Preconditions*: If `I` does not model `bidirectional_iterator`, `n` is not negative.

2 *Effects*:

(2.1) — If `I` models `random_access_iterator`, equivalent to `i += n`.

(2.2) — Otherwise, if `n` is non-negative, increments `i` by `n`.

(2.3) — Otherwise, decrements `i` by `-n`.

```
template<input_or_output_iterator I, sentinel_for<I> S>
  constexpr void ranges::advance(I& i, S bound);
```

3 *Preconditions*: `[i, bound)` denotes a range.

4 *Effects*:

(4.1) — If `I` and `S` model `assignable_from<I&, S>`, equivalent to `i = std::move(bound)`.

(4.2) — Otherwise, if `S` and `I` model `sized_sentinel_for<S, I>`, equivalent to `ranges::advance(i, bound - i)`.

(4.3) — Otherwise, while `bool(i != bound)` is `true`, increments `i`.

```
template<input_or_output_iterator I, sentinel_for<I> S>
  constexpr iter_difference_t<I> ranges::advance(I& i, iter_difference_t<I> n, S bound);
```

5 *Preconditions*: If `n > 0`, `[i, bound)` denotes a range. If `n == 0`, `[i, bound)` or `[bound, i)` denotes a range. If `n < 0`, `[bound, i)` denotes a range, `I` models `bidirectional_iterator`, and `I` and `S` model `same_as<I, S>`.

6 *Effects*:

(6.1) — If `S` and `I` model `sized_sentinel_for<S, I>`:

(6.1.1) — If $|$`n`$| \geq |$`bound - i`$|$, equivalent to `ranges::advance(i, bound)`.

(6.1.2) — Otherwise, equivalent to `ranges::advance(i, n)`.

(6.2) — Otherwise,

(6.2.1) — if `n` is non-negative, while `bool(i != bound)` is `true`, increments `i` but at most `n` times.

(6.2.2) — Otherwise, while `bool(i != bound)` is `true`, decrements `i` but at most `-n` times.

7 *Returns*: `n -` M, where M is the difference between the ending and starting positions of `i`.

23.4.4.3 `ranges::distance` [range.iter.op.distance]

```
template<input_or_output_iterator I, sentinel_for<I> S>
  constexpr iter_difference_t<I> ranges::distance(I first, S last);
```

1 *Preconditions*: `[first, last)` denotes a range, or `[last, first)` denotes a range and `S` and `I` model `same_as<S, I> && sized_sentinel_for<S, I>`.

2 *Effects*: If `S` and `I` model `sized_sentinel_for<S, I>`, returns `(last - first)`; otherwise, returns the number of increments needed to get from `first` to `last`.

```
template<range R>
  constexpr range_difference_t<R> ranges::distance(R&& r);
```

3 *Effects*: If `R` models `sized_range`, equivalent to:

```
return static_cast<range_difference_t<R>>(ranges::size(r));     // 24.3.10
```

Otherwise, equivalent to:

```
return ranges::distance(ranges::begin(r), ranges::end(r));      // 24.3
```

23.4.4.4 `ranges::next` [range.iter.op.next]

```
template<input_or_output_iterator I>
  constexpr I ranges::next(I x);
```

1 *Effects*: Equivalent to: `++x; return x;`

```
template<input_or_output_iterator I>
  constexpr I ranges::next(I x, iter_difference_t<I> n);
```

2 *Effects*: Equivalent to: `ranges::advance(x, n); return x;`

```
template<input_or_output_iterator I, sentinel_for<I> S>
  constexpr I ranges::next(I x, S bound);
```

3 *Effects*: Equivalent to: `ranges::advance(x, bound); return x;`

```
template<input_or_output_iterator I, sentinel_for<I> S>
  constexpr I ranges::next(I x, iter_difference_t<I> n, S bound);
```

4 *Effects*: Equivalent to: `ranges::advance(x, n, bound); return x;`

23.4.4.5 `ranges::prev` [range.iter.op.prev]

```
template<bidirectional_iterator I>
  constexpr I ranges::prev(I x);
```

1 *Effects*: Equivalent to: `--x; return x;`

```
template<bidirectional_iterator I>
  constexpr I ranges::prev(I x, iter_difference_t<I> n);
```

2 *Effects*: Equivalent to: `ranges::advance(x, -n); return x;`

```
template<bidirectional_iterator I>
  constexpr I ranges::prev(I x, iter_difference_t<I> n, I bound);
```

3 *Effects*: Equivalent to: `ranges::advance(x, -n, bound); return x;`

23.5 Iterator adaptors [predef.iterators]

23.5.1 Reverse iterators [reverse.iterators]

23.5.1.1 General [reverse.iterators.general]

1 Class template `reverse_iterator` is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence.

23.5.1.2 Class template reverse_iterator [reverse.iterator]

```
namespace std {
  template<class Iterator>
  class reverse_iterator {
  public:
    using iterator_type     = Iterator;
    using iterator_concept  = see below;
    using iterator_category = see below;
    using value_type        = iter_value_t<Iterator>;
    using difference_type   = iter_difference_t<Iterator>;
    using pointer           = typename iterator_traits<Iterator>::pointer;
    using reference         = iter_reference_t<Iterator>;

    constexpr reverse_iterator();
    constexpr explicit reverse_iterator(Iterator x);
    template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
    template<class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

    constexpr Iterator base() const;
    constexpr reference operator*() const;
    constexpr pointer   operator->() const requires see below;

    constexpr reverse_iterator& operator++();
    constexpr reverse_iterator  operator++(int);
    constexpr reverse_iterator& operator--();
    constexpr reverse_iterator  operator--(int);

    constexpr reverse_iterator  operator+ (difference_type n) const;
    constexpr reverse_iterator& operator+=(difference_type n);
    constexpr reverse_iterator  operator- (difference_type n) const;
    constexpr reverse_iterator& operator-=(difference_type n);
    constexpr unspecified operator[](difference_type n) const;

    friend constexpr iter_rvalue_reference_t<Iterator>
      iter_move(const reverse_iterator& i) noexcept(see below);
    template<indirectly_swappable<Iterator> Iterator2>
      friend constexpr void
        iter_swap(const reverse_iterator& x,
                  const reverse_iterator<Iterator2>& y) noexcept(see below);

  protected:
    Iterator current;
  };
}
```

1 The member *typedef-name* `iterator_concept` denotes

(1.1) — `random_access_iterator_tag` if `Iterator` models `random_access_iterator`, and

(1.2) — `bidirectional_iterator_tag` otherwise.

2 The member *typedef-name* `iterator_category` denotes

(2.1) — `random_access_iterator_tag` if the type `iterator_traits<Iterator>::iterator_category` models `derived_from<random_access_iterator_tag>`, and

(2.2) — `iterator_traits<Iterator>::iterator_category` otherwise.

23.5.1.3 Requirements [reverse.iter.requirements]

1 The template parameter `Iterator` shall either meet the requirements of a *Cpp17BidirectionalIterator* (23.3.5.6) or model `bidirectional_iterator` (23.3.4.12).

2 Additionally, `Iterator` shall either meet the requirements of a *Cpp17RandomAccessIterator* (23.3.5.7) or model `random_access_iterator` (23.3.4.13) if the definitions of any of the members

(2.1) — `operator+`, `operator-`, `operator+=`, `operator-=` (23.5.1.7), or

(2.2) — `operator[]` (23.5.1.6),

or the non-member operators (23.5.1.8)

(2.3) — `operator<`, `operator>`, `operator<=`, `operator>=`, `operator-`, or `operator+` (23.5.1.9)

are instantiated (13.9.2).

23.5.1.4 Construction and assignment [reverse.iter.cons]

```
constexpr reverse_iterator();
```

1 *Effects*: Value-initializes `current`. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type `Iterator`.

```
constexpr explicit reverse_iterator(Iterator x);
```

2 *Effects*: Initializes `current` with `x`.

```
template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
```

3 *Effects*: Initializes `current` with `u.current`.

```
template<class U>
  constexpr reverse_iterator&
    operator=(const reverse_iterator<U>& u);
```

4 *Effects*: Assigns `u.base()` to `current`.

5 *Returns*: `*this`.

23.5.1.5 Conversion [reverse.iter.conv]

```
constexpr Iterator base() const;          // explicit
```

1 *Returns*: `current`.

23.5.1.6 Element access [reverse.iter.elem]

```
constexpr reference operator*() const;
```

1 *Effects*: As if by:

```
Iterator tmp = current;
return *--tmp;
```

```
constexpr pointer operator->() const
  requires (is_pointer_v<Iterator> ||
            requires (const Iterator i) { i.operator->(); });
```

2 *Effects*:

(2.1) — If `Iterator` is a pointer type, equivalent to: `return prev(current);`

(2.2) — Otherwise, equivalent to: `return prev(current).operator->();`

```
constexpr unspecified operator[](difference_type n) const;
```

3 *Returns*: `current[-n-1]`.

23.5.1.7 Navigation [reverse.iter.nav]

```
constexpr reverse_iterator operator+(difference_type n) const;
```

1 *Returns*: `reverse_iterator(current-n)`.

```
constexpr reverse_iterator operator-(difference_type n) const;
```

2 *Returns*: `reverse_iterator(current+n)`.

```
constexpr reverse_iterator& operator++();
```

3 *Effects*: As if by: `--current;`

4 *Returns*: `*this`.

```
constexpr reverse_iterator operator++(int);
```

5 *Effects*: As if by:

```
reverse_iterator tmp = *this;
--current;
return tmp;
```

```
constexpr reverse_iterator& operator--();
```

6 *Effects*: As if by `++current`.

7 *Returns*: `*this`.

```
constexpr reverse_iterator operator--(int);
```

8 *Effects*: As if by:

```
reverse_iterator tmp = *this;
++current;
return tmp;
```

```
constexpr reverse_iterator& operator+=(difference_type n);
```

9 *Effects*: As if by: `current -= n;`

10 *Returns*: `*this`.

```
constexpr reverse_iterator& operator-=(difference_type n);
```

11 *Effects*: As if by: `current += n;`

12 *Returns*: `*this`.

23.5.1.8 Comparisons [reverse.iter.cmp]

```
template<class Iterator1, class Iterator2>
  constexpr bool operator==(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

1 *Constraints*: `x.base() == y.base()` is well-formed and convertible to `bool`.

2 *Returns*: `x.base() == y.base()`.

```
template<class Iterator1, class Iterator2>
  constexpr bool operator!=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

3 *Constraints*: `x.base() != y.base()` is well-formed and convertible to `bool`.

4 *Returns*: `x.base() != y.base()`.

```
template<class Iterator1, class Iterator2>
  constexpr bool operator<(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

5 *Constraints*: `x.base() > y.base()` is well-formed and convertible to `bool`.

6 *Returns*: `x.base() > y.base()`.

```
template<class Iterator1, class Iterator2>
  constexpr bool operator>(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

7 *Constraints*: `x.base() < y.base()` is well-formed and convertible to `bool`.

8 *Returns*: `x.base() < y.base()`.

```
template<class Iterator1, class Iterator2>
  constexpr bool operator<=(
    const reverse_iterator<Iterator1>& x,
```

```
const reverse_iterator<Iterator2>& y);
```

9 *Constraints*: `x.base() >= y.base()` is well-formed and convertible to `bool`.

10 *Returns*: `x.base() >= y.base()`.

```
template<class Iterator1, class Iterator2>
  constexpr bool operator>=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

11 *Constraints*: `x.base() <= y.base()` is well-formed and convertible to `bool`.

12 *Returns*: `x.base() <= y.base()`.

```
template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
  constexpr compare_three_way_result_t<Iterator1, Iterator2>
    operator<=>(const reverse_iterator<Iterator1>& x,
                const reverse_iterator<Iterator2>& y);
```

13 *Returns*: `y.base() <=> x.base()`.

14 [*Note 1*: The argument order in the *Returns*: element is reversed because this is a reverse iterator. — *end note*]

23.5.1.9 Non-member functions [reverse.iter.nonmember]

```
template<class Iterator1, class Iterator2>
  constexpr auto operator-(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());
```

1 *Returns*: `y.base() - x.base()`.

```
template<class Iterator>
  constexpr reverse_iterator<Iterator> operator+(
    iter_difference_t<Iterator> n,
    const reverse_iterator<Iterator>& x);
```

2 *Returns*: `reverse_iterator<Iterator>(x.base() - n)`.

```
friend constexpr iter_rvalue_reference_t<Iterator>
  iter_move(const reverse_iterator& i) noexcept(see below);
```

3 *Effects*: Equivalent to:

```
auto tmp = i.base();
return ranges::iter_move(--tmp);
```

4 *Remarks*: The expression in `noexcept` is equivalent to:

```
is_nothrow_copy_constructible_v<Iterator> &&
noexcept(ranges::iter_move(--declval<Iterator&>()))
```

```
template<indirectly_swappable<Iterator> Iterator2>
  friend constexpr void
    iter_swap(const reverse_iterator& x,
              const reverse_iterator<Iterator2>& y) noexcept(see below);
```

5 *Effects*: Equivalent to:

```
auto xtmp = x.base();
auto ytmp = y.base();
ranges::iter_swap(--xtmp, --ytmp);
```

6 *Remarks*: The expression in `noexcept` is equivalent to:

```
is_nothrow_copy_constructible_v<Iterator> &&
is_nothrow_copy_constructible_v<Iterator2> &&
noexcept(ranges::iter_swap(--declval<Iterator&>(), --declval<Iterator2&>()))
```

```
template<class Iterator>
  constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);
```

7 *Returns*: `reverse_iterator<Iterator>(i)`.

23.5.2 Insert iterators [insert.iterators]

23.5.2.1 General [insert.iterators.general]

1 To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called *insert iterators*, are provided in the library. With regular iterator classes,

```
while (first != last) *result++ = *first++;
```

causes a range `[first, last)` to be copied into a range starting with result. The same code with `result` being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the *insert mode* instead of the *regular overwrite* mode.

2 An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators meet the requirements of output iterators. `operator*` returns the insert iterator itself. The assignment `operator=(const T& x)` is defined on insert iterators to allow writing into them, it inserts `x` right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. `back_insert_iterator` inserts elements at the end of a container, `front_insert_iterator` inserts elements at the beginning of a container, and `insert_iterator` inserts elements where the iterator points to in a container. `back_inserter`, `front_inserter`, and `inserter` are three functions making the insert iterators out of a container.

23.5.2.2 Class template `back_insert_iterator` [back.insert.iterator]

```
namespace std {
  template<class Container>
  class back_insert_iterator {
  protected:
    Container* container = nullptr;

  public:
    using iterator_category = output_iterator_tag;
    using value_type        = void;
    using difference_type   = ptrdiff_t;
    using pointer           = void;
    using reference         = void;
    using container_type    = Container;

    constexpr back_insert_iterator() noexcept = default;
    constexpr explicit back_insert_iterator(Container& x);
    constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
    constexpr back_insert_iterator& operator=(typename Container::value_type&& value);

    constexpr back_insert_iterator& operator*();
    constexpr back_insert_iterator& operator++();
    constexpr back_insert_iterator  operator++(int);
  };
}
```

23.5.2.2.1 Operations [back.insert.iter.ops]

```
constexpr explicit back_insert_iterator(Container& x);
```

1 *Effects*: Initializes `container` with `addressof(x)`.

```
constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
```

2 *Effects*: As if by: `container->push_back(value);`

3 *Returns*: `*this`.

```
constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
```

4 *Effects*: As if by: `container->push_back(std::move(value));`

5 *Returns*: `*this`.

```
constexpr back_insert_iterator& operator*();
```

6 *Returns*: `*this`.

```
constexpr back_insert_iterator& operator++();
constexpr back_insert_iterator  operator++(int);
```

7 *Returns*: `*this`.

23.5.2.2.2 back_inserter [back.inserter]

```
template<class Container>
  constexpr back_insert_iterator<Container> back_inserter(Container& x);
```

1 *Returns*: `back_insert_iterator<Container>(x)`.

23.5.2.3 Class template front_insert_iterator [front.insert.iterator]

```
namespace std {
  template<class Container>
  class front_insert_iterator {
  protected:
    Container* container = nullptr;

  public:
    using iterator_category = output_iterator_tag;
    using value_type        = void;
    using difference_type   = ptrdiff_t;
    using pointer           = void;
    using reference         = void;
    using container_type    = Container;

    constexpr front_insert_iterator() noexcept = default;
    constexpr explicit front_insert_iterator(Container& x);
    constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
    constexpr front_insert_iterator& operator=(typename Container::value_type&& value);

    constexpr front_insert_iterator& operator*();
    constexpr front_insert_iterator& operator++();
    constexpr front_insert_iterator  operator++(int);
  };
}
```

23.5.2.3.1 Operations [front.insert.iter.ops]

```
constexpr explicit front_insert_iterator(Container& x);
```

1 *Effects*: Initializes `container` with `addressof(x)`.

```
constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
```

2 *Effects*: As if by: `container->push_front(value);`

3 *Returns*: `*this`.

```
constexpr front_insert_iterator& operator=(typename Container::value_type&& value);
```

4 *Effects*: As if by: `container->push_front(std::move(value));`

5 *Returns*: `*this`.

```
constexpr front_insert_iterator& operator*();
```

6 *Returns*: `*this`.

```
constexpr front_insert_iterator& operator++();
constexpr front_insert_iterator  operator++(int);
```

7 *Returns*: `*this`.

23.5.2.3.2 front_inserter [front.inserter]

```
template<class Container>
  constexpr front_insert_iterator<Container> front_inserter(Container& x);
```

1 *Returns*: `front_insert_iterator<Container>(x)`.

23.5.2.4 Class template insert_iterator [insert.iterator]

```
namespace std {
  template<class Container>
  class insert_iterator {
  protected:
    Container* container = nullptr;
    ranges::iterator_t<Container> iter = ranges::iterator_t<Container>();

  public:
    using iterator_category = output_iterator_tag;
    using value_type        = void;
    using difference_type   = ptrdiff_t;
    using pointer           = void;
    using reference         = void;
    using container_type    = Container;

    insert_iterator() = default;
    constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
    constexpr insert_iterator& operator=(const typename Container::value_type& value);
    constexpr insert_iterator& operator=(typename Container::value_type&& value);

    constexpr insert_iterator& operator*();
    constexpr insert_iterator& operator++();
    constexpr insert_iterator& operator++(int);
  };
}
```

23.5.2.4.1 Operations [insert.iter.ops]

```
constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
```

1 *Effects*: Initializes `container` with `addressof(x)` and `iter` with `i`.

```
constexpr insert_iterator& operator=(const typename Container::value_type& value);
```

2 *Effects*: As if by:

```
iter = container->insert(iter, value);
++iter;
```

3 *Returns*: `*this`.

```
constexpr insert_iterator& operator=(typename Container::value_type&& value);
```

4 *Effects*: As if by:

```
iter = container->insert(iter, std::move(value));
++iter;
```

5 *Returns*: `*this`.

```
constexpr insert_iterator& operator*();
```

6 *Returns*: `*this`.

```
constexpr insert_iterator& operator++();
constexpr insert_iterator& operator++(int);
```

7 *Returns*: `*this`.

23.5.2.4.2 inserter [inserter]

```
template<class Container>
  constexpr insert_iterator<Container>
    inserter(Container& x, ranges::iterator_t<Container> i);
```

1 *Returns*: `insert_iterator<Container>(x, i)`.

23.5.3 Move iterators and sentinels [move.iterators]

23.5.3.1 General [move.iterators.general]

1 Class template `move_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator's indirection operator to an rvalue. Some generic algorithms can be called with move iterators to replace copying with moving.

2 [*Example 1*:

```
list<string> s;
// populate the list s
vector<string> v1(s.begin(), s.end());          // copies strings into v1
vector<string> v2(make_move_iterator(s.begin()),
                  make_move_iterator(s.end())); // moves strings into v2
```

— *end example*]

23.5.3.2 Class template `move_iterator` [move.iterator]

```
namespace std {
  template<class Iterator>
  class move_iterator {
  public:
    using iterator_type     = Iterator;
    using iterator_concept  = input_iterator_tag;
    using iterator_category = see below;
    using value_type        = iter_value_t<Iterator>;
    using difference_type   = iter_difference_t<Iterator>;
    using pointer           = Iterator;
    using reference         = iter_rvalue_reference_t<Iterator>;

    constexpr move_iterator();
    constexpr explicit move_iterator(Iterator i);
    template<class U> constexpr move_iterator(const move_iterator<U>& u);
    template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

    constexpr iterator_type base() const &;
    constexpr iterator_type base() &&;
    constexpr reference operator*() const;

    constexpr move_iterator& operator++();
    constexpr auto operator++(int);
    constexpr move_iterator& operator--();
    constexpr move_iterator operator--(int);

    constexpr move_iterator operator+(difference_type n) const;
    constexpr move_iterator& operator+=(difference_type n);
    constexpr move_iterator operator-(difference_type n) const;
    constexpr move_iterator& operator-=(difference_type n);
    constexpr reference operator[](difference_type n) const;

    template<sentinel_for<Iterator> S>
      friend constexpr bool
        operator==(const move_iterator& x, const move_sentinel<S>& y);
    template<sized_sentinel_for<Iterator> S>
      friend constexpr iter_difference_t<Iterator>
        operator-(const move_sentinel<S>& x, const move_iterator& y);
    template<sized_sentinel_for<Iterator> S>
      friend constexpr iter_difference_t<Iterator>
        operator-(const move_iterator& x, const move_sentinel<S>& y);
    friend constexpr iter_rvalue_reference_t<Iterator>
      iter_move(const move_iterator& i)
        noexcept(noexcept(ranges::iter_move(i.current)));
```

```
    template<indirectly_swappable<Iterator> Iterator2>
      friend constexpr void
        iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
          noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

  private:
    Iterator current;     // exposition only
  };
}
```

1 The member *typedef-name* `iterator_category` denotes

(1.1) — `random_access_iterator_tag` if the type `iterator_traits<Iterator>::iterator_category` models `derived_from<random_access_iterator_tag>`, and

(1.2) — `iterator_traits<Iterator>::iterator_category` otherwise.

23.5.3.3 Requirements [move.iter.requirements]

1 The template parameter `Iterator` shall either meet the *Cpp17InputIterator* requirements (23.3.5.3) or model `input_iterator` (23.3.4.9). Additionally, if any of the bidirectional traversal functions are instantiated, the template parameter shall either meet the *Cpp17BidirectionalIterator* requirements (23.3.5.6) or model `bidirectional_iterator` (23.3.4.12). If any of the random access traversal functions are instantiated, the template parameter shall either meet the *Cpp17RandomAccessIterator* requirements (23.3.5.7) or model `random_access_iterator` (23.3.4.13).

23.5.3.4 Construction and assignment [move.iter.cons]

```
constexpr move_iterator();
```

1 *Effects*: Constructs a `move_iterator`, value-initializing `current`. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type `Iterator`.

```
constexpr explicit move_iterator(Iterator i);
```

2 *Effects*: Constructs a `move_iterator`, initializing `current` with `std::move(i)`.

```
template<class U> constexpr move_iterator(const move_iterator<U>& u);
```

3 *Mandates*: `U` is convertible to `Iterator`.

4 *Effects*: Constructs a `move_iterator`, initializing `current` with `u.base()`.

```
template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);
```

5 *Mandates*: `U` is convertible to `Iterator`.

6 *Effects*: Assigns `u.base()` to `current`.

23.5.3.5 Conversion [move.iter.op.conv]

```
constexpr Iterator base() const &;
```

1 *Constraints*: `Iterator` satisfies `copy_constructible`.

2 *Preconditions*: `Iterator` models `copy_constructible`.

3 *Returns*: `current`.

```
constexpr Iterator base() &&;
```

4 *Returns*: `std::move(current)`.

23.5.3.6 Element access [move.iter.elem]

```
constexpr reference operator*() const;
```

1 *Effects*: Equivalent to: `return ranges::iter_move(current);`

```
constexpr reference operator[](difference_type n) const;
```

2 *Effects*: Equivalent to: `return ranges::iter_move(current + n);`

23.5.3.7 Navigation [move.iter.nav]

```
constexpr move_iterator& operator++();
```

1 *Effects*: As if by `++current`.

2 *Returns*: `*this`.

```
constexpr auto operator++(int);
```

3 *Effects*: If `Iterator` models `forward_iterator`, equivalent to:

```
move_iterator tmp = *this;
++current;
return tmp;
```

Otherwise, equivalent to `++current`.

```
constexpr move_iterator& operator--();
```

4 *Effects*: As if by `--current`.

5 *Returns*: `*this`.

```
constexpr move_iterator operator--(int);
```

6 *Effects*: As if by:

```
move_iterator tmp = *this;
--current;
return tmp;
```

```
constexpr move_iterator operator+(difference_type n) const;
```

7 *Returns*: `move_iterator(current + n)`.

```
constexpr move_iterator& operator+=(difference_type n);
```

8 *Effects*: As if by: `current += n;`

9 *Returns*: `*this`.

```
constexpr move_iterator operator-(difference_type n) const;
```

10 *Returns*: `move_iterator(current - n)`.

```
constexpr move_iterator& operator-=(difference_type n);
```

11 *Effects*: As if by: `current -= n;`

12 *Returns*: `*this`.

23.5.3.8 Comparisons [move.iter.op.comp]

```
template<class Iterator1, class Iterator2>
  constexpr bool operator==(const move_iterator<Iterator1>& x,
                            const move_iterator<Iterator2>& y);
template<sentinel_for<Iterator> S>
  friend constexpr bool operator==(const move_iterator& x,
                                   const move_sentinel<S>& y);
```

1 *Constraints*: `x.base() == y.base()` is well-formed and convertible to `bool`.

2 *Returns*: `x.base() == y.base()`.

```
template<class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

3 *Constraints*: `x.base() < y.base()` is well-formed and convertible to `bool`.

4 *Returns*: `x.base() < y.base()`.

```
template<class Iterator1, class Iterator2>
constexpr bool operator>(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

5 *Constraints*: `y.base() < x.base()` is well-formed and convertible to `bool`.

6 *Returns*: `y < x`.

```
template<class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

7 *Constraints*: `y.base() < x.base()` is well-formed and convertible to `bool`.

8 *Returns*: `!(y < x)`.

```
template<class Iterator1, class Iterator2>
constexpr bool operator>=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

9 *Constraints*: `x.base() < y.base()` is well-formed and convertible to `bool`.

10 *Returns*: `!(x < y)`.

```
template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
  constexpr compare_three_way_result_t<Iterator1, Iterator2>
    operator<=>(const move_iterator<Iterator1>& x,
                const move_iterator<Iterator2>& y);
```

11 *Returns*: `x.base() <=> y.base()`.

23.5.3.9 Non-member functions [move.iter.nonmember]

```
template<class Iterator1, class Iterator2>
  constexpr auto operator-(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y)
      -> decltype(x.base() - y.base());
template<sized_sentinel_for<Iterator> S>
  friend constexpr iter_difference_t<Iterator>
    operator-(const move_sentinel<S>& x, const move_iterator& y);
template<sized_sentinel_for<Iterator> S>
  friend constexpr iter_difference_t<Iterator>
    operator-(const move_iterator& x, const move_sentinel<S>& y);
```

1 *Returns*: `x.base() - y.base()`.

```
template<class Iterator>
  constexpr move_iterator<Iterator>
    operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator>& x);
```

2 *Constraints*: `x + n` is well-formed and has type `Iterator`.

3 *Returns*: `x + n`.

```
friend constexpr iter_rvalue_reference_t<Iterator>
  iter_move(const move_iterator& i)
    noexcept(noexcept(ranges::iter_move(i.current)));
```

4 *Effects*: Equivalent to: `return ranges::iter_move(i.current);`

```
template<indirectly_swappable<Iterator> Iterator2>
  friend constexpr void
    iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
      noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
```

5 *Effects*: Equivalent to: `ranges::iter_swap(x.current, y.current)`.

```
template<class Iterator>
constexpr move_iterator<Iterator> make_move_iterator(Iterator i);
```

6 *Returns*: `move_iterator<Iterator>(std::move(i))`.

23.5.3.10 Class template `move_sentinel` [move.sentinel]

1 Class template `move_sentinel` is a sentinel adaptor useful for denoting ranges together with `move_iterator`. When an input iterator type `I` and sentinel type `S` model `sentinel_for<S, I>`, `move_sentinel<S>` and `move_iterator<I>` model `sentinel_for<move_sentinel<S>, move_iterator<I>>` as well.

2 [*Example 1*: A `move_if` algorithm is easily implemented with `copy_if` using `move_iterator` and `move_sentinel`:

```
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
         indirect_unary_predicate<I> Pred>
  requires indirectly_movable<I, O>
void move_if(I first, S last, O out, Pred pred) {
  std::ranges::copy_if(move_iterator<I>{first}, move_sentinel<S>{last}, out, pred);
}
```

— *end example*]

```
namespace std {
  template<semiregular S>
  class move_sentinel {
  public:
    constexpr move_sentinel();
    constexpr explicit move_sentinel(S s);
    template<class S2>
      requires convertible_to<const S2&, S>
        constexpr move_sentinel(const move_sentinel<S2>& s);
    template<class S2>
      requires assignable_from<S&, const S2&>
        constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

    constexpr S base() const;
  private:
    S last;       // exposition only
  };
}
```

23.5.3.11 Operations [move.sent.ops]

```
constexpr move_sentinel();
```

1 *Effects*: Value-initializes `last`. If `is_trivially_default_constructible_v<S>` is `true`, then this constructor is a `constexpr` constructor.

```
constexpr explicit move_sentinel(S s);
```

2 *Effects*: Initializes `last` with `std::move(s)`.

```
template<class S2>
  requires convertible_to<const S2&, S>
    constexpr move_sentinel(const move_sentinel<S2>& s);
```

3 *Effects*: Initializes `last` with `s.last`.

```
template<class S2>
  requires assignable_from<S&, const S2&>
    constexpr move_sentinel& operator=(const move_sentinel<S2>& s);
```

4 *Effects*: Equivalent to: `last = s.last; return *this;`

```
constexpr S base() const;
```

5 *Returns*: `last`.

23.5.4 Common iterators [iterators.common]

23.5.4.1 Class template `common_iterator` [common.iterator]

1 Class template `common_iterator` is an iterator/sentinel adaptor that is capable of representing a non-common range of elements (where the types of the iterator and sentinel differ) as a common range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.

2 [*Note 1*: The `common_iterator` type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type. — *end note*]

3 [*Example 1*:

```
template<class ForwardIterator>
void fun(ForwardIterator begin, ForwardIterator end);
```

```
list<int> s;
// populate the list s
using CI = common_iterator<counted_iterator<list<int>::iterator>, default_sentinel_t>;
// call fun on a range of 10 ints
fun(CI(counted_iterator(s.begin(), 10)), CI(default_sentinel));
```

— *end example*]

```
namespace std {
  template<input_or_output_iterator I, sentinel_for<I> S>
    requires (!same_as<I, S> && copyable<I>)
  class common_iterator {
  public:
    constexpr common_iterator() = default;
    constexpr common_iterator(I i);
    constexpr common_iterator(S s);
    template<class I2, class S2>
      requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
        constexpr common_iterator(const common_iterator<I2, S2>& x);

    template<class I2, class S2>
      requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
               assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
        common_iterator& operator=(const common_iterator<I2, S2>& x);

    decltype(auto) operator*();
    decltype(auto) operator*() const
      requires dereferenceable<const I>;
    decltype(auto) operator->() const
      requires see below;

    common_iterator& operator++();
    decltype(auto) operator++(int);

    template<class I2, sentinel_for<I> S2>
      requires sentinel_for<S, I2>
    friend bool operator==(
      const common_iterator& x, const common_iterator<I2, S2>& y);
    template<class I2, sentinel_for<I> S2>
      requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
    friend bool operator==(
      const common_iterator& x, const common_iterator<I2, S2>& y);

    template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
      requires sized_sentinel_for<S, I2>
    friend iter_difference_t<I2> operator-(
      const common_iterator& x, const common_iterator<I2, S2>& y);

    friend iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
      noexcept(noexcept(ranges::iter_move(declval<const I&>())))
        requires input_iterator<I>;
    template<indirectly_swappable<I> I2, class S2>
      friend void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
        noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())));

  private:
    variant<I, S> v_;    // exposition only
  };

  template<class I, class S>
  struct incrementable_traits<common_iterator<I, S>> {
    using difference_type = iter_difference_t<I>;
  };
```

```
    template<input_iterator I, class S>
    struct iterator_traits<common_iterator<I, S>> {
      using iterator_concept = see below;
      using iterator_category = see below;
      using value_type = iter_value_t<I>;
      using difference_type = iter_difference_t<I>;
      using pointer = see below;
      using reference = iter_reference_t<I>;
    };
  }
```

23.5.4.2 Associated types [common.iter.types]

1 The nested *typedef-name*s of the specialization of `iterator_traits` for `common_iterator<I, S>` are defined as follows.

(1.1) — `iterator_concept` denotes `forward_iterator_tag` if `I` models `forward_iterator`; otherwise it denotes `input_iterator_tag`.

(1.2) — `iterator_category` denotes `forward_iterator_tag` if `iterator_traits<I>::iterator_category` models `derived_from<forward_iterator_tag>`; otherwise it denotes `input_iterator_tag`.

(1.3) — If the expression `a.operator->()` is well-formed, where `a` is an lvalue of type `const common_iterator<I, S>`, then `pointer` denotes the type of that expression. Otherwise, `pointer` denotes `void`.

23.5.4.3 Constructors and conversions [common.iter.const]

```
constexpr common_iterator(I i);
```

1 *Effects*: Initializes `v_` as if by `v_{in_place_type<I>, std::move(i)}`.

```
constexpr common_iterator(S s);
```

2 *Effects*: Initializes `v_` as if by `v_{in_place_type<S>, std::move(s)}`.

```
template<class I2, class S2>
  requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
    constexpr common_iterator(const common_iterator<I2, S2>& x);
```

3 *Preconditions*: `x.v_.valueless_by_exception()` is `false`.

4 *Effects*: Initializes `v_` as if by `v_{in_place_index<i>, get<i>(x.v_)}`, where i is `x.v_.index()`.

```
template<class I2, class S2>
  requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
           assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
    common_iterator& operator=(const common_iterator<I2, S2>& x);
```

5 *Preconditions*: `x.v_.valueless_by_exception()` is `false`.

6 *Effects*: Equivalent to:

(6.1) — If `v_.index() == x.v_.index()`, then `get<i>(v_) = get<i>(x.v_)`.

(6.2) — Otherwise, `v_.emplace<i>(get<i>(x.v_))`.

where i is `x.v_.index()`.

7 *Returns*: `*this`

23.5.4.4 Accessors [common.iter.access]

```
decltype(auto) operator*();
decltype(auto) operator*() const
  requires dereferenceable<const I>;
```

1 *Preconditions*: `holds_alternative<I>(v_)`.

2 *Effects*: Equivalent to: `return *get<I>(v_);`

```
decltype(auto) operator->() const
  requires see below;
```

3 The expression in the *requires-clause* is equivalent to:

```
indirectly_readable<const I> &&
(requires(const I& i) { i.operator->(); } ||
 is_reference_v<iter_reference_t<I>> ||
 constructible_from<iter_value_t<I>, iter_reference_t<I>>)
```

4 *Preconditions*: `holds_alternative<I>(v_)`.

5 *Effects*:

(5.1) — If `I` is a pointer type or if the expression `get<I>(v_).operator->()` is well-formed, equivalent to: `return get<I>(v_);`

(5.2) — Otherwise, if `iter_reference_t<I>` is a reference type, equivalent to:

```
auto&& tmp = *get<I>(v_);
return addressof(tmp);
```

(5.3) — Otherwise, equivalent to: `return proxy(*get<I>(v_));` where *proxy* is the exposition-only class:

```
class proxy {
  iter_value_t<I> keep_;
  proxy(iter_reference_t<I>&& x)
    : keep_(std::move(x)) {}
public:
  const iter_value_t<I>* operator->() const {
    return addressof(keep_);
  }
};
```

23.5.4.5 Navigation [common.iter.nav]

```
common_iterator& operator++();
```

1 *Preconditions*: `holds_alternative<I>(v_)`.

2 *Effects*: Equivalent to `++get<I>(v_)`.

3 *Returns*: `*this`.

```
decltype(auto) operator++(int);
```

4 *Preconditions*: `holds_alternative<I>(v_)`.

5 *Effects*: If `I` models `forward_iterator`, equivalent to:

```
common_iterator tmp = *this;
++*this;
return tmp;
```

Otherwise, equivalent to: `return get<I>(v_)++;`

23.5.4.6 Comparisons [common.iter.cmp]

```
template<class I2, sentinel_for<I> S2>
  requires sentinel_for<S, I2>
friend bool operator==(
  const common_iterator& x, const common_iterator<I2, S2>& y);
```

1 *Preconditions*: `x.v_.valueless_by_exception()` and `y.v_.valueless_by_exception()` are each `false`.

2 *Returns*: `true` if i `==` j, and otherwise `get<i>(x.v_) == get<j>(y.v_)`, where i is `x.v_.index()` and j is `y.v_.index()`.

```
template<class I2, sentinel_for<I> S2>
  requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
friend bool operator==(
```

```
  const common_iterator& x, const common_iterator<I2, S2>& y);
```

3 *Preconditions*: `x.v_.valueless_by_exception()` and `y.v_.valueless_by_exception()` are each `false`.

4 *Returns*: `true` if i and j are each `1`, and otherwise `get<i>(x.v_) == get<j>(y.v_)`, where i is `x.v_.index()` and j is `y.v_.index()`.

```
template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
  requires sized_sentinel_for<S, I2>
friend iter_difference_t<I2> operator-(
  const common_iterator& x, const common_iterator<I2, S2>& y);
```

5 *Preconditions*: `x.v_.valueless_by_exception()` and `y.v_.valueless_by_exception()` are each `false`.

6 *Returns*: `0` if i and j are each `1`, and otherwise `get<i>(x.v_) - get<j>(y.v_)`, where i is `x.v_.index()` and j is `y.v_.index()`.

23.5.4.7 Customizations [common.iter.cust]

```
friend iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
  noexcept(noexcept(ranges::iter_move(declval<const I&>())))
    requires input_iterator<I>;
```

1 *Preconditions*: `holds_alternative<I>(v_)`.

2 *Effects*: Equivalent to: `return ranges::iter_move(get<I>(i.v_));`

```
template<indirectly_swappable<I> I2, class S2>
  friend void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
    noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())));
```

3 *Preconditions*: `holds_alternative<I>(x.v_)` and `holds_alternative<I2>(y.v_)` are each `true`.

4 *Effects*: Equivalent to `ranges::iter_swap(get<I>(x.v_), get<I2>(y.v_))`.

23.5.5 Default sentinel [default.sentinel]

```
namespace std {
  struct default_sentinel_t { };
}
```

1 Class `default_sentinel_t` is an empty type used to denote the end of a range. It can be used together with iterator types that know the bound of their range (e.g., `counted_iterator` (23.5.6.1)).

23.5.6 Counted iterators [iterators.counted]

23.5.6.1 Class template `counted_iterator` [counted.iterator]

1 Class template `counted_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of the distance to the end of its range. It can be used together with `default_sentinel` in calls to generic algorithms to operate on a range of N elements starting at a given position without needing to know the end position a priori.

2 [*Example 1*:

```
list<string> s;
// populate the list s with at least 10 strings
vector<string> v;
// copies 10 strings into v:
ranges::copy(counted_iterator(s.begin(), 10), default_sentinel, back_inserter(v));
```

— *end example*]

3 Two values `i1` and `i2` of types `counted_iterator<I1>` and `counted_iterator<I2>` refer to elements of the same sequence if and only if `next(i1.base(), i1.count())` and `next(i2.base(), i2.count())` refer to the same (possibly past-the-end) element.

```
namespace std {
  template<input_or_output_iterator I>
  class counted_iterator {
  public:
    using iterator_type = I;

    constexpr counted_iterator() = default;
    constexpr counted_iterator(I x, iter_difference_t<I> n);
    template<class I2>
      requires convertible_to<const I2&, I>
        constexpr counted_iterator(const counted_iterator<I2>& x);

    template<class I2>
      requires assignable_from<I&, const I2&>
        constexpr counted_iterator& operator=(const counted_iterator<I2>& x);

    constexpr I base() const & requires copy_constructible<I>;
    constexpr I base() &&;
    constexpr iter_difference_t<I> count() const noexcept;
    constexpr decltype(auto) operator*();
    constexpr decltype(auto) operator*() const
      requires dereferenceable<const I>;

    constexpr counted_iterator& operator++();
    decltype(auto) operator++(int);
    constexpr counted_iterator operator++(int)
      requires forward_iterator<I>;
    constexpr counted_iterator& operator--()
      requires bidirectional_iterator<I>;
    constexpr counted_iterator operator--(int)
      requires bidirectional_iterator<I>;

    constexpr counted_iterator operator+(iter_difference_t<I> n) const
      requires random_access_iterator<I>;
    friend constexpr counted_iterator operator+(
      iter_difference_t<I> n, const counted_iterator& x)
        requires random_access_iterator<I>;
    constexpr counted_iterator& operator+=(iter_difference_t<I> n)
      requires random_access_iterator<I>;

    constexpr counted_iterator operator-(iter_difference_t<I> n) const
      requires random_access_iterator<I>;
    template<common_with<I> I2>
      friend constexpr iter_difference_t<I2> operator-(
        const counted_iterator& x, const counted_iterator<I2>& y);
    friend constexpr iter_difference_t<I> operator-(
      const counted_iterator& x, default_sentinel_t);
    friend constexpr iter_difference_t<I> operator-(
      default_sentinel_t, const counted_iterator& y);
    constexpr counted_iterator& operator-=(iter_difference_t<I> n)
      requires random_access_iterator<I>;

    constexpr decltype(auto) operator[](iter_difference_t<I> n) const
      requires random_access_iterator<I>;

    template<common_with<I> I2>
      friend constexpr bool operator==(
        const counted_iterator& x, const counted_iterator<I2>& y);
    friend constexpr bool operator==(
      const counted_iterator& x, default_sentinel_t);

    template<common_with<I> I2>
      friend constexpr strong_ordering operator<=>(
        const counted_iterator& x, const counted_iterator<I2>& y);
```

```
    friend constexpr iter_rvalue_reference_t<I> iter_move(const counted_iterator& i)
      noexcept(noexcept(ranges::iter_move(i.current)))
        requires input_iterator<I>;
    template<indirectly_swappable<I> I2>
      friend constexpr void iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
        noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

  private:
    I current = I();                    // exposition only
    iter_difference_t<I> length = 0;    // exposition only
  };

  template<class I>
  struct incrementable_traits<counted_iterator<I>> {
    using difference_type = iter_difference_t<I>;
  };

  template<input_iterator I>
  struct iterator_traits<counted_iterator<I>> : iterator_traits<I> {
    using pointer = void;
  };
}
```

23.5.6.2 Constructors and conversions [counted.iter.const]

```
constexpr counted_iterator(I i, iter_difference_t<I> n);
```

1 *Preconditions*: `n >= 0`.

2 *Effects*: Initializes `current` with `std::move(i)` and `length` with `n`.

```
template<class I2>
  requires convertible_to<const I2&, I>
    constexpr counted_iterator(const counted_iterator<I2>& x);
```

3 *Effects*: Initializes `current` with `x.current` and `length` with `x.length`.

```
template<class I2>
  requires assignable_from<I&, const I2&>
    constexpr counted_iterator& operator=(const counted_iterator<I2>& x);
```

4 *Effects*: Assigns `x.current` to `current` and `x.length` to `length`.

5 *Returns*: `*this`.

23.5.6.3 Accessors [counted.iter.access]

```
constexpr I base() const & requires copy_constructible<I>;
```

1 *Effects*: Equivalent to: `return current;`

```
constexpr I base() &&;
```

2 *Returns*: `std::move(current)`.

```
constexpr iter_difference_t<I> count() const noexcept;
```

3 *Effects*: Equivalent to: `return length;`

23.5.6.4 Element access [counted.iter.elem]

```
constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
  requires dereferenceable<const I>;
```

1 *Effects*: Equivalent to: `return *current;`

```
constexpr decltype(auto) operator[](iter_difference_t<I> n) const
  requires random_access_iterator<I>;
```

2 *Preconditions*: `n < length`.

3 *Effects*: Equivalent to: `return current[n];`

23.5.6.5 Navigation [counted.iter.nav]

```
constexpr counted_iterator& operator++();
```

1 *Preconditions*: `length > 0`.

2 *Effects*: Equivalent to:

```
++current;
--length;
return *this;
```

```
decltype(auto) operator++(int);
```

3 *Preconditions*: `length > 0`.

4 *Effects*: Equivalent to:

```
--length;
try { return current++; }
catch(...) { ++length; throw; }
```

```
constexpr counted_iterator operator++(int)
  requires forward_iterator<I>;
```

5 *Effects*: Equivalent to:

```
counted_iterator tmp = *this;
++*this;
return tmp;
```

```
constexpr counted_iterator& operator--()
  requires bidirectional_iterator<I>;
```

6 *Effects*: Equivalent to:

```
--current;
++length;
return *this;
```

```
constexpr counted_iterator operator--(int)
  requires bidirectional_iterator<I>;
```

7 *Effects*: Equivalent to:

```
counted_iterator tmp = *this;
--*this;
return tmp;
```

```
constexpr counted_iterator operator+(iter_difference_t<I> n) const
  requires random_access_iterator<I>;
```

8 *Effects*: Equivalent to: `return counted_iterator(current + n, length - n);`

```
friend constexpr counted_iterator operator+(
  iter_difference_t<I> n, const counted_iterator& x)
    requires random_access_iterator<I>;
```

9 *Effects*: Equivalent to: `return x + n;`

```
constexpr counted_iterator& operator+=(iter_difference_t<I> n)
  requires random_access_iterator<I>;
```

10 *Preconditions*: `n <= length`.

11 *Effects*: Equivalent to:

```
current += n;
length -= n;
return *this;
```

```
constexpr counted_iterator operator-(iter_difference_t<I> n) const
  requires random_access_iterator<I>;
```

12 *Effects*: Equivalent to: `return counted_iterator(current - n, length + n);`

```
template<common_with<I> I2>
  friend constexpr iter_difference_t<I2> operator-(
    const counted_iterator& x, const counted_iterator<I2>& y);
```

13 *Preconditions*: `x` and `y` refer to elements of the same sequence (23.5.6.1).

14 *Effects*: Equivalent to: `return y.length - x.length;`

```
friend constexpr iter_difference_t<I> operator-(
  const counted_iterator& x, default_sentinel_t);
```

15 *Effects*: Equivalent to: `return -x.length;`

```
friend constexpr iter_difference_t<I> operator-(
  default_sentinel_t, const counted_iterator& y);
```

16 *Effects*: Equivalent to: `return y.length;`

```
constexpr counted_iterator& operator-=(iter_difference_t<I> n)
  requires random_access_iterator<I>;
```

17 *Preconditions*: `-n <= length`.

18 *Effects*: Equivalent to:

```
current -= n;
length += n;
return *this;
```

23.5.6.6 Comparisons [counted.iter.cmp]

```
template<common_with<I> I2>
  friend constexpr bool operator==(
    const counted_iterator& x, const counted_iterator<I2>& y);
```

1 *Preconditions*: `x` and `y` refer to elements of the same sequence (23.5.6.1).

2 *Effects*: Equivalent to: `return x.length == y.length;`

```
friend constexpr bool operator==(
  const counted_iterator& x, default_sentinel_t);
```

3 *Effects*: Equivalent to: `return x.length == 0;`

```
template<common_with<I> I2>
  friend constexpr strong_ordering operator<=>(
    const counted_iterator& x, const counted_iterator<I2>& y);
```

4 *Preconditions*: `x` and `y` refer to elements of the same sequence (23.5.6.1).

5 *Effects*: Equivalent to: `return y.length <=> x.length;`

6 [*Note 1*: The argument order in the *Effects*: element is reversed because `length` counts down, not up. — *end note*]

23.5.6.7 Customizations [counted.iter.cust]

```
friend constexpr iter_rvalue_reference_t<I>
  iter_move(const counted_iterator& i)
    noexcept(noexcept(ranges::iter_move(i.current)))
    requires input_iterator<I>;
```

1 *Effects*: Equivalent to: `return ranges::iter_move(i.current);`

```
template<indirectly_swappable<I> I2>
  friend constexpr void
    iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
      noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
```

2 *Effects*: Equivalent to `ranges::iter_swap(x.current, y.current)`.

23.5.7 Unreachable sentinel [unreachable.sentinel]

1 Class `unreachable_sentinel_t` can be used with any `weakly_incrementable` type to denote the "upper bound" of an unbounded interval.

2 [*Example 1*:

```
char* p;
// set p to point to a character buffer containing newlines
char* nl = find(p, unreachable_sentinel, '\n');
```

Provided a newline character really exists in the buffer, the use of `unreachable_sentinel` above potentially makes the call to `find` more efficient since the loop test against the sentinel does not require a conditional branch. — *end example*]

```
namespace std {
  struct unreachable_sentinel_t {
    template<weakly_incrementable I>
      friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept
      { return false; }
  };
}
```

23.6 Stream iterators [stream.iterators]

23.6.1 General [stream.iterators.general]

1 To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

[*Example 1*:

```
partial_sum(istream_iterator<double, char>(cin),
  istream_iterator<double, char>(),
  ostream_iterator<double, char>(cout, "\n"));
```

reads a file containing floating-point numbers from `cin`, and prints the partial sums onto `cout`. — *end example*]

23.6.2 Class template `istream_iterator` [istream.iterator]

23.6.2.1 General [istream.iterator.general]

1 The class template `istream_iterator` is an input iterator (23.3.5.3) that reads successive elements from the input stream for which it was constructed.

```
namespace std {
  template<class T, class charT = char, class traits = char_traits<charT>,
           class Distance = ptrdiff_t>
  class istream_iterator {
  public:
    using iterator_category = input_iterator_tag;
    using value_type        = T;
    using difference_type   = Distance;
    using pointer           = const T*;
    using reference         = const T&;
    using char_type         = charT;
    using traits_type       = traits;
    using istream_type      = basic_istream<charT,traits>;

    constexpr istream_iterator();
    constexpr istream_iterator(default_sentinel_t);
    istream_iterator(istream_type& s);
    istream_iterator(const istream_iterator& x) = default;
    ~istream_iterator() = default;
    istream_iterator& operator=(const istream_iterator&) = default;

    const T& operator*() const;
    const T* operator->() const;
    istream_iterator& operator++();
    istream_iterator  operator++(int);
```

```
    friend bool operator==(const istream_iterator& i, default_sentinel_t);

  private:
    basic_istream<charT,traits>* in_stream; // exposition only
    T value;                                // exposition only
  };
}
```

2 The type T shall meet the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, and *Cpp17CopyAssignable* requirements.

23.6.2.2 Constructors and destructor [istream.iterator.cons]

```
constexpr istream_iterator();
constexpr istream_iterator(default_sentinel_t);
```

1 *Effects*: Constructs the end-of-stream iterator, value-initializing `value`.

2 *Postconditions*: `in_stream == nullptr` is `true`.

3 *Remarks*: If the initializer `T()` in the declaration `auto x = T();` is a constant initializer (7.7), then these constructors are `constexpr` constructors.

```
istream_iterator(istream_type& s);
```

4 *Effects*: Initializes `in_stream` with `addressof(s)`, value-initializes `value`, and then calls `operator++()`.

```
istream_iterator(const istream_iterator& x) = default;
```

5 *Postconditions*: `in_stream == x.in_stream` is `true`.

6 *Remarks*: If `is_trivially_copy_constructible_v<T>` is `true`, then this constructor is trivial.

```
~istream_iterator() = default;
```

7 *Remarks*: If `is_trivially_destructible_v<T>` is `true`, then this destructor is trivial.

23.6.2.3 Operations [istream.iterator.ops]

```
const T& operator*() const;
```

1 *Preconditions*: `in_stream != nullptr` is `true`.

2 *Returns*: `value`.

```
const T* operator->() const;
```

3 *Preconditions*: `in_stream != nullptr` is `true`.

4 *Returns*: `addressof(value)`.

```
istream_iterator& operator++();
```

5 *Preconditions*: `in_stream != nullptr` is `true`.

6 *Effects*: Equivalent to:

```
if (!(*in_stream >> value))
  in_stream = nullptr;
```

7 *Returns*: `*this`.

```
istream_iterator operator++(int);
```

8 *Preconditions*: `in_stream != nullptr` is `true`.

9 *Effects*: Equivalent to:

```
istream_iterator tmp = *this;
++*this;
return tmp;
```

```
template<class T, class charT, class traits, class Distance>
  bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
                  const istream_iterator<T,charT,traits,Distance>& y);
```

10 *Returns*: `x.in_stream == y.in_stream`.

```
friend bool operator==(const istream_iterator& i, default_sentinel_t);
```

11 *Returns*: `!i.in_stream`.

23.6.3 Class template `ostream_iterator` [ostream.iterator]

23.6.3.1 General [ostream.iterator.general]

1 `ostream_iterator` writes (using `operator<<`) successive elements onto the output stream from which it was constructed. If it was constructed with `charT*` as a constructor argument, this string, called a *delimiter string*, is written to the stream after every `T` is written.

```
namespace std {
  template<class T, class charT = char, class traits = char_traits<charT>>
  class ostream_iterator {
  public:
    using iterator_category = output_iterator_tag;
    using value_type        = void;
    using difference_type   = ptrdiff_t;
    using pointer           = void;
    using reference         = void;
    using char_type         = charT;
    using traits_type       = traits;
    using ostream_type      = basic_ostream<charT,traits>;

    constexpr ostream_iterator() noexcept = default;
    ostream_iterator(ostream_type& s);
    ostream_iterator(ostream_type& s, const charT* delimiter);
    ostream_iterator(const ostream_iterator& x);
    ~ostream_iterator();
    ostream_iterator& operator=(const ostream_iterator&) = default;
    ostream_iterator& operator=(const T& value);

    ostream_iterator& operator*();
    ostream_iterator& operator++();
    ostream_iterator& operator++(int);

  private:
    basic_ostream<charT,traits>* out_stream = nullptr;          // exposition only
    const charT* delim = nullptr;                               // exposition only
  };
}
```

23.6.3.2 Constructors and destructor [ostream.iterator.cons.des]

```
ostream_iterator(ostream_type& s);
```

1 *Effects*: Initializes `out_stream` with `addressof(s)` and `delim` with `nullptr`.

```
ostream_iterator(ostream_type& s, const charT* delimiter);
```

2 *Effects*: Initializes `out_stream` with `addressof(s)` and `delim` with `delimiter`.

23.6.3.3 Operations [ostream.iterator.ops]

```
ostream_iterator& operator=(const T& value);
```

1 *Effects*: As if by:

```
*out_stream << value;
if (delim)
  *out_stream << delim;
return *this;
```

```
ostream_iterator& operator*();
```

2 *Returns*: `*this`.

```
ostream_iterator& operator++();
ostream_iterator& operator++(int);
```

3 *Returns*: `*this`.

23.6.4 Class template istreambuf_iterator [istreambuf.iterator]

23.6.4.1 General [istreambuf.iterator.general]

1 The class template `istreambuf_iterator` defines an input iterator (23.3.5.3) that reads successive *characters* from the streambuf for which it was constructed. `operator*` provides access to the current input character, if any. Each time `operator++` is evaluated, the iterator advances to the next input character. If the end of stream is reached (`streambuf_type::sgetc()` returns `traits::eof()`), the iterator becomes equal to the *end-of-stream* iterator value. The default constructor `istreambuf_iterator()` and the constructor `istreambuf_iterator(nullptr)` both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of `istreambuf_iterator` shall have a trivial copy constructor, a `constexpr` default constructor, and a trivial destructor.

2 The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator value a `char_type` value is returned. It is impossible to assign a character via an input iterator.

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class istreambuf_iterator {
  public:
    using iterator_category = input_iterator_tag;
    using value_type        = charT;
    using difference_type   = typename traits::off_type;
    using pointer           = unspecified;
    using reference         = charT;
    using char_type         = charT;
    using traits_type       = traits;
    using int_type          = typename traits::int_type;
    using streambuf_type    = basic_streambuf<charT,traits>;
    using istream_type      = basic_istream<charT,traits>;

    class proxy;                          // exposition only

    constexpr istreambuf_iterator() noexcept;
    constexpr istreambuf_iterator(default_sentinel_t) noexcept;
    istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
    ~istreambuf_iterator() = default;
    istreambuf_iterator(istream_type& s) noexcept;
    istreambuf_iterator(streambuf_type* s) noexcept;
    istreambuf_iterator(const proxy& p) noexcept;
    istreambuf_iterator& operator=(const istreambuf_iterator&) noexcept = default;
    charT operator*() const;
    istreambuf_iterator& operator++();
    proxy operator++(int);
    bool equal(const istreambuf_iterator& b) const;

    friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);

  private:
    streambuf_type* sbuf_;                // exposition only
  };
}
```

23.6.4.2 Class istreambuf_iterator::*proxy* [istreambuf.iterator.proxy]

1 Class `istreambuf_iterator<charT,traits>::`*`proxy`* is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class `istreambuf_iterator<charT, traits>::`*`proxy`* provides a temporary placeholder as the return value of the post-increment operator (`operator++`). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

```
namespace std {
  template<class charT, class traits>
  class istreambuf_iterator<charT, traits>::proxy { // exposition only
    charT keep_;
    basic_streambuf<charT,traits>* sbuf_;
    proxy(charT c, basic_streambuf<charT,traits>* sbuf)
      : keep_(c), sbuf_(sbuf) { }
  public:
    charT operator*() { return keep_; }
  };
}
```

23.6.4.3 Constructors [istreambuf.iterator.cons]

1 For each `istreambuf_iterator` constructor in this subclause, an end-of-stream iterator is constructed if and only if the exposition-only member `sbuf_` is initialized with a null pointer value.

```
constexpr istreambuf_iterator() noexcept;
constexpr istreambuf_iterator(default_sentinel_t) noexcept;
```

2 *Effects*: Initializes `sbuf_` with `nullptr`.

```
istreambuf_iterator(istream_type& s) noexcept;
```

3 *Effects*: Initializes `sbuf_` with `s.rdbuf()`.

```
istreambuf_iterator(streambuf_type* s) noexcept;
```

4 *Effects*: Initializes `sbuf_` with `s`.

```
istreambuf_iterator(const proxy& p) noexcept;
```

5 *Effects*: Initializes `sbuf_` with `p.sbuf_`.

23.6.4.4 Operations [istreambuf.iterator.ops]

```
charT operator*() const;
```

1 *Returns*: The character obtained via the `streambuf` member `sbuf_->sgetc()`.

```
istreambuf_iterator& operator++();
```

2 *Effects*: As if by `sbuf_->sbumpc()`.

3 *Returns*: `*this`.

```
proxy operator++(int);
```

4 *Returns*: `proxy(sbuf_->sbumpc(), sbuf_)`.

```
bool equal(const istreambuf_iterator& b) const;
```

5 *Returns*: `true` if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what `streambuf` object they use.

```
template<class charT, class traits>
  bool operator==(const istreambuf_iterator<charT,traits>& a,
                  const istreambuf_iterator<charT,traits>& b);
```

6 *Returns*: `a.equal(b)`.

```
friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
```

7 *Returns*: `i.equal(s)`.

23.6.5 Class template `ostreambuf_iterator` [ostreambuf.iterator]

23.6.5.1 General [ostreambuf.iterator.general]

1 The class template `ostreambuf_iterator` writes successive *characters* onto the output stream from which it was constructed.

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class ostreambuf_iterator {
  public:
    using iterator_category = output_iterator_tag;
    using value_type        = void;
    using difference_type   = ptrdiff_t;
    using pointer           = void;
    using reference         = void;
    using char_type         = charT;
    using traits_type       = traits;
    using streambuf_type    = basic_streambuf<charT,traits>;
    using ostream_type      = basic_ostream<charT,traits>;

    constexpr ostreambuf_iterator() noexcept = default;
    ostreambuf_iterator(ostream_type& s) noexcept;
    ostreambuf_iterator(streambuf_type* s) noexcept;
    ostreambuf_iterator& operator=(charT c);

    ostreambuf_iterator& operator*();
    ostreambuf_iterator& operator++();
    ostreambuf_iterator& operator++(int);
    bool failed() const noexcept;

  private:
    streambuf_type* sbuf_ = nullptr;    // exposition only
  };
}
```

23.6.5.2 Constructors [ostreambuf.iter.cons]

`ostreambuf_iterator(ostream_type& s) noexcept;`

1 *Preconditions*: `s.rdbuf()` is not a null pointer.

2 *Effects*: Initializes `sbuf_` with `s.rdbuf()`.

`ostreambuf_iterator(streambuf_type* s) noexcept;`

3 *Preconditions*: `s` is not a null pointer.

4 *Effects*: Initializes `sbuf_` with `s`.

23.6.5.3 Operations [ostreambuf.iter.ops]

`ostreambuf_iterator& operator=(charT c);`

1 *Effects*: If `failed()` yields `false`, calls `sbuf_->sputc(c)`; otherwise has no effect.

2 *Returns*: `*this`.

`ostreambuf_iterator& operator*();`

3 *Returns*: `*this`.

```
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
```

4 *Returns*: `*this`.

`bool failed() const noexcept;`

5 *Returns*: `true` if in any prior use of member `operator=`, the call to `sbuf_->sputc()` returned `traits::eof()`; or `false` otherwise.

23.7 Range access [iterator.range]

1 In addition to being available via inclusion of the `<iterator>` header, the function templates in 23.7 are available when any of the following headers are included: `<array>` (22.3.2), `<deque>` (22.3.3), `<forward_list>` (22.3.4), `<list>` (22.3.5), `<map>` (22.4.2), `<regex>` (30.3), `<set>` (22.4.3), `<span>` (22.7.2), `<string>` (21.3.2),

<string_view> (21.4.2), <unordered_map> (22.5.2), <unordered_set> (22.5.3), and <vector> (22.3.6). Each of these templates is a designated customization point (16.4.5.2.1).

```
template<class C> constexpr auto begin(C& c) -> decltype(c.begin());
template<class C> constexpr auto begin(const C& c) -> decltype(c.begin());
```

2 *Returns*: `c.begin()`.

```
template<class C> constexpr auto end(C& c) -> decltype(c.end());
template<class C> constexpr auto end(const C& c) -> decltype(c.end());
```

3 *Returns*: `c.end()`.

```
template<class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;
```

4 *Returns*: `array`.

```
template<class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;
```

5 *Returns*: `array + N`.

```
template<class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c)))
  -> decltype(std::begin(c));
```

6 *Returns*: `std::begin(c)`.

```
template<class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c)))
  -> decltype(std::end(c));
```

7 *Returns*: `std::end(c)`.

```
template<class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());
template<class C> constexpr auto rbegin(const C& c) -> decltype(c.rbegin());
```

8 *Returns*: `c.rbegin()`.

```
template<class C> constexpr auto rend(C& c) -> decltype(c.rend());
template<class C> constexpr auto rend(const C& c) -> decltype(c.rend());
```

9 *Returns*: `c.rend()`.

```
template<class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);
```

10 *Returns*: `reverse_iterator<T*>(array + N)`.

```
template<class T, size_t N> constexpr reverse_iterator<T*> rend(T (&array)[N]);
```

11 *Returns*: `reverse_iterator<T*>(array)`.

```
template<class E> constexpr reverse_iterator<const E*> rbegin(initializer_list<E> il);
```

12 *Returns*: `reverse_iterator<const E*>(il.end())`.

```
template<class E> constexpr reverse_iterator<const E*> rend(initializer_list<E> il);
```

13 *Returns*: `reverse_iterator<const E*>(il.begin())`.

```
template<class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));
```

14 *Returns*: `std::rbegin(c)`.

```
template<class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));
```

15 *Returns*: `std::rend(c)`.

```
template<class C> constexpr auto size(const C& c) -> decltype(c.size());
```

16 *Returns*: `c.size()`.

```
template<class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;
```

17 *Returns*: `N`.

```
template<class C> constexpr auto ssize(const C& c)
```

```
-> common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>;
```

18 *Effects*: Equivalent to:

```
return static_cast<common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>>(c.size());
```

```
template<class T, ptrdiff_t N> constexpr ptrdiff_t ssize(const T (&array)[N]) noexcept;
```

19 *Returns*: `N`.

```
template<class C> [[nodiscard]] constexpr auto empty(const C& c) -> decltype(c.empty());
```

20 *Returns*: `c.empty()`.

```
template<class T, size_t N> [[nodiscard]] constexpr bool empty(const T (&array)[N]) noexcept;
```

21 *Returns*: `false`.

```
template<class E> [[nodiscard]] constexpr bool empty(initializer_list<E> il) noexcept;
```

22 *Returns*: `il.size() == 0`.

```
template<class C> constexpr auto data(C& c) -> decltype(c.data());
template<class C> constexpr auto data(const C& c) -> decltype(c.data());
```

23 *Returns*: `c.data()`.

```
template<class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;
```

24 *Returns*: `array`.

```
template<class E> constexpr const E* data(initializer_list<E> il) noexcept;
```

25 *Returns*: `il.begin()`.

24 Ranges library [ranges]

24.1 General [ranges.general]

1 This Clause describes components for dealing with ranges of elements.

2 The following subclauses describe range and view requirements, and components for range primitives as summarized in Table 90.

Table 90: Ranges library summary [tab:range.summary]

	Subclause	Header
24.3	Range access	`<ranges>`
24.4	Requirements	
24.5	Range utilities	
24.6	Range factories	
24.7	Range adaptors	

24.2 Header <ranges> synopsis [ranges.syn]

```
#include <compare>              // see 17.11.1
#include <initializer_list>     // see 17.10.2
#include <iterator>             // see 23.2

namespace std::ranges {
  inline namespace unspecified {
    // 24.3, range access
    inline constexpr unspecified begin = unspecified;
    inline constexpr unspecified end = unspecified;
    inline constexpr unspecified cbegin = unspecified;
    inline constexpr unspecified cend = unspecified;
    inline constexpr unspecified rbegin = unspecified;

    using type = S;
  };
}
```

1 Within this Clause, for an integer-like type `X` (23.3.4.4), *`make-unsigned-like-t`*`<X>` denotes `make_unsigned_t<X>` if `X` is an integer type; otherwise, it denotes a corresponding unspecified unsigned-integer-like type of the same width as `X`. For an expression `x` of type `X`, *`to-unsigned-like`*`(x)` is `x` explicitly converted to *`make-unsigned-like-t`*`<X>`.

24.3 Range access [range.access]

24.3.1 General [range.access.general]

1 In addition to being available via inclusion of the `<ranges>` header, the customization point objects in 24.3 are available when `<iterator>` (23.2) is included.

2 Within 24.3, the *reified object* of a subexpression `E` denotes

(2.1) — the same object as `E` if `E` is a glvalue, or

(2.2) — the result of applying the temporary materialization conversion (7.3.5) to `E` otherwise.

24.3.2 `ranges::begin` [range.access.begin]

1 The name `ranges::begin` denotes a customization point object (16.3.3.3.6).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::begin(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (6.8.3) and `remove_all_extents_t<T>` is an incomplete type, `ranges::begin(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if `T` is an array type, `ranges::begin(E)` is expression-equivalent to `t + 0`.

(2.4) — Otherwise, if *`decay-copy`*`(t.begin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::begin(E)` is expression-equivalent to *`decay-copy`*`(t.begin())`.

(2.5) — Otherwise, if `T` is a class or enumeration type and *`decay-copy`*`(begin(t))` is a valid expression whose type models `input_or_output_iterator` with overload resolution performed in a context in which unqualified lookup for `begin` finds only the declarations

```
void begin(auto&) = delete;
void begin(const auto&) = delete;
```

then `ranges::begin(E)` is expression-equivalent to *`decay-copy`*`(begin(t))` with overload resolution performed in the above context.

(2.6) — Otherwise, `ranges::begin(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::begin(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::begin(E)` is a valid expression, its type models `input_or_output_iterator`. — *end note*]

24.3.3 `ranges::end` [range.access.end]

1 The name `ranges::end` denotes a customization point object (16.3.3.3.6).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::end(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (6.8.3) and `remove_all_extents_t<T>` is an incomplete type, `ranges::end(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if `T` is an array of unknown bound, `ranges::end(E)` is ill-formed.

(2.4) — Otherwise, if `T` is an array, `ranges::end(E)` is expression-equivalent to `t + extent_v<T>`.

(2.5) — Otherwise, if *`decay-copy`*`(t.end())` is a valid expression whose type models `sentinel_for<iterator_t<T>>` then `ranges::end(E)` is expression-equivalent to *`decay-copy`*`(t.end())`.

(2.6) — Otherwise, if `T` is a class or enumeration type and *`decay-copy`*`(end(t))` is a valid expression whose type models `sentinel_for<iterator_t<T>>` with overload resolution performed in a context in which unqualified lookup for `end` finds only the declarations

```
void end(auto&) = delete;
void end(const auto&) = delete;
```

then `ranges::end(E)` is expression-equivalent to *`decay-copy`*`(end(t))` with overload resolution performed in the above context.

(2.7) — Otherwise, `ranges::end(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::end(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::end(E)` is a valid expression, the types `S` and `I` of `ranges::end(E)` and `ranges::begin(E)` model `sentinel_for<S, I>`. — *end note*]

24.3.4 `ranges::cbegin` [range.access.cbegin]

1 The name `ranges::cbegin` denotes a customization point object (16.3.3.3.6). The expression `ranges::cbegin(E)` for a subexpression `E` of type `T` is expression-equivalent to:

(1.1) — `ranges::begin(static_cast<const T&>(E))` if `E` is an lvalue.

(1.2) — Otherwise, `ranges::begin(static_cast<const T&&>(E))`.

2 [*Note 1*: Whenever `ranges::cbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — *end note*]

24.3.5 `ranges::cend` [range.access.cend]

1 The name `ranges::cend` denotes a customization point object (16.3.3.3.6). The expression `ranges::cend(E)` for a subexpression `E` of type `T` is expression-equivalent to:

(1.1) — `ranges::end(static_cast<const T&>(E))` if `E` is an lvalue.

(1.2) — Otherwise, `ranges::end(static_cast<const T&&>(E))`.

2 [*Note 1*: Whenever `ranges::cend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::cend(E)` and `ranges::cbegin(E)` model `sentinel_for<S, I>`. — *end note*]

24.3.6 `ranges::rbegin` [range.access.rbegin]

1 The name `ranges::rbegin` denotes a customization point object (16.3.3.3.6).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::rbegin(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (6.8.3) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rbegin(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if *`decay-copy`*`(t.rbegin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::rbegin(E)` is expression-equivalent to *`decay-copy`*`(t.rbegin())`.

(2.4) — Otherwise, if `T` is a class or enumeration type and *`decay-copy`*`(rbegin(t))` is a valid expression whose type models `input_or_output_iterator` with overload resolution performed in a context in which unqualified lookup for `rbegin` finds only the declarations

```
void rbegin(auto&) = delete;
void rbegin(const auto&) = delete;
```

then `ranges::rbegin(E)` is expression-equivalent to *`decay-copy`*`(rbegin(t))` with overload resolution performed in the above context.

(2.5) — Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (23.3.4.12), `ranges::rbegin(E)` is expression-equivalent to `make_reverse_iterator(ranges::end(t))`.

(2.6) — Otherwise, `ranges::rbegin(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::rbegin(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::rbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — *end note*]

24.3.7 `ranges::rend` [range.access.rend]

1 The name `ranges::rend` denotes a customization point object (16.3.3.3.6).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::rend(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (6.8.3) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rend(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if *decay-copy*`(t.rend())` is a valid expression whose type models `sentinel_for<decltype(ranges::rbegin(E))>` then `ranges::rend(E)` is expression-equivalent to *decay-copy*`(t.rend())`.

(2.4) — Otherwise, if `T` is a class or enumeration type and *decay-copy*`(rend(t))` is a valid expression whose type models `sentinel_for<decltype(ranges::rbegin(E))>` with overload resolution performed in a context in which unqualified lookup for `rend` finds only the declarations

```
void rend(auto&) = delete;
void rend(const auto&) = delete;
```

then `ranges::rend(E)` is expression-equivalent to *decay-copy*`(rend(t))` with overload resolution performed in the above context.

(2.5) — Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (23.3.4.12), then `ranges::rend(E)` is expression-equivalent to `make_reverse_iterator(ranges::begin(t))`.

(2.6) — Otherwise, `ranges::rend(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::rend(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::rend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::rend(E)` and `ranges::rbegin(E)` model `sentinel_for<S, I>`. — *end note*]

24.3.8 `ranges::crbegin` [range.access.crbegin]

1 The name `ranges::crbegin` denotes a customization point object (16.3.3.3.6). The expression `ranges::crbegin(E)` for a subexpression `E` of type `T` is expression-equivalent to:

(1.1) — `ranges::rbegin(static_cast<const T&>(E))` if `E` is an lvalue.

(1.2) — Otherwise, `ranges::rbegin(static_cast<const T&&>(E))`.

2 [*Note 1*: Whenever `ranges::crbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — *end note*]

24.3.9 `ranges::crend` [range.access.crend]

1 The name `ranges::crend` denotes a customization point object (16.3.3.3.6). The expression `ranges::crend(E)` for a subexpression `E` of type `T` is expression-equivalent to:

(1.1) — `ranges::rend(static_cast<const T&>(E))` if `E` is an lvalue.

(1.2) — Otherwise, `ranges::rend(static_cast<const T&&>(E))`.

2 [*Note 1*: Whenever `ranges::crend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::crend(E)` and `ranges::crbegin(E)` model `sentinel_for<S, I>`. — *end note*]

24.3.10 `ranges::size` [range.prim.size]

1 The name `ranges::size` denotes a customization point object (16.3.3.3.6).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `T` is an array of unknown bound (9.3.4.5), `ranges::size(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type, `ranges::size(E)` is expression-equivalent to *decay-copy*`(extent_v<T>)`.

(2.3) — Otherwise, if `disable_sized_range<remove_cv_t<T>>` (24.4.3) is `false` and *decay-copy*`(t.size())` is a valid expression of integer-like type (23.3.4.4), `ranges::size(E)` is expression-equivalent to *decay-copy*`(t.size())`.

(2.4) — Otherwise, if `T` is a class or enumeration type, `disable_sized_range<remove_cv_t<T>>` is `false` and *decay-copy*`(size(t))` is a valid expression of integer-like type with overload resolution performed in a context in which unqualified lookup for `size` finds only the declarations

```
void size(auto&) = delete;
void size(const auto&) = delete;
```

then `ranges::size(E)` is expression-equivalent to *`decay-copy`*`(size(t))` with overload resolution performed in the above context.

(2.5) — Otherwise, if *`to-unsigned-like`*`(ranges::end(t) - ranges::begin(t))` (24.2) is a valid expression and the types `I` and `S` of `ranges::begin(t)` and `ranges::end(t)` (respectively) model both `sized_sentinel_for<S, I>` (23.3.4.8) and `forward_iterator<I>`, then `ranges::size(E)` is expression-equivalent to *`to-unsigned-like`*`(ranges::end(t) - ranges::begin(t))`.

(2.6) — Otherwise, `ranges::size(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::size(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::size(E)` is a valid expression, its type is integer-like. — *end note*]

24.3.11 `ranges::ssize` [range.prim.ssize]

1 The name `ranges::ssize` denotes a customization point object (16.3.3.3.6). The expression `ranges::ssize(E)` for a subexpression `E` of type `T` is expression-equivalent to:

(1.1) — If `range_difference_t<T>` has width less than `ptrdiff_t`, `static_cast<ptrdiff_t>(ranges::size(E))`.

(1.2) — Otherwise, `static_cast<range_difference_t<T>>(ranges::size(E))`.

24.3.12 `ranges::empty` [range.prim.empty]

1 The name `ranges::empty` denotes a customization point object (16.3.3.3.6).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `T` is an array of unknown bound (6.8.3), `ranges::empty(E)` is ill-formed.

(2.2) — Otherwise, if `bool(t.empty())` is a valid expression, `ranges::empty(E)` is expression-equivalent to `bool(t.empty())`.

(2.3) — Otherwise, if `(ranges::size(t) == 0)` is a valid expression, `ranges::empty(E)` is expression-equivalent to `(ranges::size(t) == 0)`.

(2.4) — Otherwise, if `bool(ranges::begin(t) == ranges::end(t))` is a valid expression and the type of `ranges::begin(t)` models `forward_iterator`, `ranges::empty(E)` is expression-equivalent to `bool(ranges::begin(t) == ranges::end(t))`.

(2.5) — Otherwise, `ranges::empty(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::empty(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::empty(E)` is a valid expression, it has type `bool`. — *end note*]

24.3.13 `ranges::data` [range.prim.data]

1 The name `ranges::data` denotes a customization point object (16.3.3.3.6).

2 Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is `false`, `ranges::data(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (6.8.3) and `remove_all_extents_t<T>` is an incomplete type, `ranges::data(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if *`decay-copy`*`(t.data())` is a valid expression of pointer to object type, `ranges::data(E)` is expression-equivalent to *`decay-copy`*`(t.data())`.

(2.4) — Otherwise, if `ranges::begin(t)` is a valid expression whose type models `contiguous_iterator`, `ranges::data(E)` is expression-equivalent to `to_address(ranges::begin(E))`.

(2.5) — Otherwise, `ranges::data(E)` is ill-formed.

3 [*Note 1*: Diagnosable ill-formed cases above result in substitution failure when `ranges::data(E)` appears in the immediate context of a template instantiation. — *end note*]

4 [*Note 2*: Whenever `ranges::data(E)` is a valid expression, it has pointer to object type. — *end note*]

24.3.14 `ranges::cdata` [range.prim.cdata]

1 The name `ranges::cdata` denotes a customization point object (16.3.3.3.6). The expression `ranges::cdata(E)` for a subexpression `E` of type `T` is expression-equivalent to:

(1.1) — `ranges::data(static_cast<const T&>(E))` if `E` is an lvalue.

(1.2) — Otherwise, `ranges::data(static_cast<const T&&>(E))`.

2 [*Note 1*: Whenever `ranges::cdata(E)` is a valid expression, it has pointer to object type. — *end note*]

24.4 Range requirements [range.req]

24.4.1 General [range.req.general]

1 Ranges are an abstraction that allow a C++ program to operate on elements of data structures uniformly. Calling `ranges::begin` on a range returns an object whose type models `input_or_output_iterator` (23.3.4.6). Calling `ranges::end` on a range returns an object whose type `S`, together with the type `I` of the object returned by `ranges::begin`, models `sentinel_for<S, I>`. The library formalizes the interfaces, semantics, and complexity of ranges to enable algorithms and range adaptors that work efficiently on different types of sequences.

2 The `range` concept requires that `ranges::begin` and `ranges::end` return an iterator and a sentinel, respectively. The `sized_range` concept refines `range` with the requirement that `ranges::size` be amortized $\mathscr{O}(1)$. The `view` concept specifies requirements on a `range` type with constant-time destruction and move operations.

3 Several refinements of `range` group requirements that arise frequently in concepts and algorithms. Common ranges are ranges for which `ranges::begin` and `ranges::end` return objects of the same type. Random access ranges are ranges for which `ranges::begin` returns a type that models `random_access_iterator` (23.3.4.13). (Contiguous, bidirectional, forward, input, and output ranges are defined similarly.) Viewable ranges can be converted to views.

24.4.2 Ranges [range.range]

1 The `range` concept defines the requirements of a type that allows iteration over its elements by providing an iterator and sentinel that denote the elements of the range.

```
template<class T>
  concept range =
    requires(T& t) {
      ranges::begin(t);          // sometimes equality-preserving (see below)
      ranges::end(t);
    };
```

2 The required expressions `ranges::begin(t)` and `ranges::end(t)` of the `range` concept do not require implicit expression variations (18.2).

3 Given an expression `t` such that `decltype((t))` is `T&`, `T` models `range` only if

(3.1) — `[ranges::begin(t), ranges::end(t))` denotes a range (23.3.1),

(3.2) — both `ranges::begin(t)` and `ranges::end(t)` are amortized constant time and non-modifying, and

(3.3) — if the type of `ranges::begin(t)` models `forward_iterator`, `ranges::begin(t)` is equality-preserving.

4 [*Note 1*: Equality preservation of both `ranges::begin` and `ranges::end` enables passing a `range` whose iterator type models `forward_iterator` to multiple algorithms and making multiple passes over the range by repeated calls to `ranges::begin` and `ranges::end`. Since `ranges::begin` is not required to be equality-preserving when the return type does not model `forward_iterator`, repeated calls might not return equal values or might not be well-defined. — *end note*]

```
template<class T>
  concept borrowed_range =
    range<T> &&
      (is_lvalue_reference_v<T> || enable_borrowed_range<remove_cvref_t<T>>);
```

5 Given an expression `E` such that `decltype((E))` is `T`, `T` models `borrowed_range` only if the validity of iterators obtained from the object denoted by `E` is not tied to the lifetime of that object.

6 [*Note 2*: Since the validity of iterators is not tied to the lifetime of an object whose type models `borrowed_range`, a function can accept arguments of such a type by value and return iterators obtained from it without danger of dangling. — *end note*]

```
template<class>
  inline constexpr bool enable_borrowed_range = false;
```

7 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `enable_borrowed_range` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

8 [*Example 1*: Each specialization `S` of class template `subrange` (24.5.4) models `borrowed_range` because

(8.1) — `enable_borrowed_range<S>` is specialized to have the value `true`, and

(8.2) — `S`'s iterators do not have validity tied to the lifetime of an `S` object because they are "borrowed" from some other range.

— *end example*]

24.4.3 Sized ranges [range.sized]

1 The `sized_range` concept refines `range` with the requirement that the number of elements in the range can be determined in amortized constant time using `ranges::size`.

```
template<class T>
  concept sized_range =
    range<T> &&
    requires(T& t) { ranges::size(t); };
```

2 Given an lvalue `t` of type `remove_reference_t<T>`, `T` models `sized_range` only if

(2.1) — `ranges::size(t)` is amortized $\mathcal{O}(1)$, does not modify `t`, and is equal to `ranges::distance(t)`, and

(2.2) — if `iterator_t<T>` models `forward_iterator`, `ranges::size(t)` is well-defined regardless of the evaluation of `ranges::begin(t)`.

[*Note 1*: `ranges::size(t)` is otherwise not required to be well-defined after evaluating `ranges::begin(t)`. For example, `ranges::size(t)` might be well-defined for a `sized_range` whose iterator type does not model `forward_iterator` only if evaluated before the first call to `ranges::begin(t)`. — *end note*]

```
template<class>
  inline constexpr bool disable_sized_range = false;
```

3 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `disable_sized_range` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

4 [*Note 2*: `disable_sized_range` allows use of range types with the library that satisfy but do not in fact model `sized_range`. — *end note*]

24.4.4 Views [range.view]

1 The `view` concept specifies the requirements of a `range` type that has constant time move construction, move assignment, and destruction; that is, the cost of these operations is independent of the number of elements in the `view`.

```
template<class T>
  concept view =
    range<T> && movable<T> && default_initializable<T> && enable_view<T>;
```

2 `T` models `view` only if:

(2.1) — `T` has $\mathcal{O}(1)$ move construction; and

(2.2) — `T` has $\mathcal{O}(1)$ move assignment; and

(2.3) — `T` has $\mathcal{O}(1)$ destruction; and

(2.4) — `copy_constructible<T>` is `false`, or `T` has $\mathcal{O}(1)$ copy construction; and

(2.5) — `copyable<T>` is `false`, or `T` has $\mathcal{O}(1)$ copy assignment.

3 [*Example 1*: Examples of `view`s are:

(3.1) — A `range` type that wraps a pair of iterators.

(3.2) — A `range` type that holds its elements by `shared_ptr` and shares ownership with all its copies.

(3.3) — A `range` type that generates its elements on demand.

Most containers (Clause 22) are not views since destruction of the container destroys the elements, which cannot be done in constant time. — *end example*]

4 Since the difference between `range` and `view` is largely semantic, the two are differentiated with the help of `enable_view`.

```
template<class T>
  inline constexpr bool enable_view = derived_from<T, view_base>;
```

5 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `enable_view` to `true` for cv-unqualified program-defined types which model `view`, and `false` for types which do not. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

24.4.5 Other range refinements [range.refinements]

1 The `output_range` concept specifies requirements of a `range` type for which `ranges::begin` returns a model of `output_iterator` (23.3.4.10). `input_range`, `forward_range`, `bidirectional_range`, and `random_access_range` are defined similarly.

```
template<class R, class T>
  concept output_range =
    range<R> && output_iterator<iterator_t<R>, T>;

template<class T>
  concept input_range =
    range<T> && input_iterator<iterator_t<T>>;

template<class T>
  concept forward_range =
    input_range<T> && forward_iterator<iterator_t<T>>;

template<class T>
  concept bidirectional_range =
    forward_range<T> && bidirectional_iterator<iterator_t<T>>;

template<class T>
  concept random_access_range =
    bidirectional_range<T> && random_access_iterator<iterator_t<T>>;
```

2 `contiguous_range` additionally requires that the `ranges::data` customization point object (24.3.13) is usable with the range.

```
template<class T>
  concept contiguous_range =
    random_access_range<T> && contiguous_iterator<iterator_t<T>> &&
    requires(T& t) {
      { ranges::data(t) } -> same_as<add_pointer_t<range_reference_t<T>>>;
    };
```

3 Given an expression `t` such that `decltype((t))` is `T&`, `T` models `contiguous_range` only if `to_address(ranges::begin(t)) == ranges::data(t)` is `true`.

4 The `common_range` concept specifies requirements of a `range` type for which `ranges::begin` and `ranges::end` return objects of the same type.

[*Example 1*: The standard containers (Clause 22) model `common_range`. — *end example*]

```
template<class T>
  concept common_range =
    range<T> && same_as<iterator_t<T>, sentinel_t<T>>;
```

5 The `viewable_range` concept specifies the requirements of a `range` type that can be converted to a `view` safely.

```
template<class T>
  concept viewable_range =
    range<T> && (borrowed_range<T> || view<remove_cvref_t<T>>);
```

24.5 Range utilities [range.utility]

24.5.1 General [range.utility.general]

1 The components in 24.5 are general utilities for representing and manipulating ranges.

24.5.2 Helper concepts [range.utility.helpers]

1 Many of the types in subclause 24.5 are specified in terms of the following exposition-only concepts:

```
template<class R>
  concept simple-view =                         // exposition only
    view<R> && range<const R> &&
    same_as<iterator_t<R>, iterator_t<const R>> &&
    same_as<sentinel_t<R>, sentinel_t<const R>>;

template<class I>
  concept has-arrow =                           // exposition only
    input_iterator<I> && (is_pointer_v<I> || requires(I i) { i.operator->(); });

template<class T, class U>
  concept not-same-as =                         // exposition only
    !same_as<remove_cvref_t<T>, remove_cvref_t<U>>;
```

24.5.3 View interface [view.interface]

24.5.3.1 General [view.interface.general]

1 The class template `view_interface` is a helper for defining `view`-like types that offer a container-like interface. It is parameterized with the type that is derived from it.

```
namespace std::ranges {
  template<class D>
    requires is_class_v<D> && same_as<D, remove_cv_t<D>>
  class view_interface : public view_base {
  private:
    constexpr D& derived() noexcept {                 // exposition only
      return static_cast<D&>(*this);
    }
    constexpr const D& derived() const noexcept {     // exposition only
      return static_cast<const D&>(*this);
    }
  public:
    constexpr bool empty() requires forward_range<D> {
      return ranges::begin(derived()) == ranges::end(derived());
    }
    constexpr bool empty() const requires forward_range<const D> {
      return ranges::begin(derived()) == ranges::end(derived());
    }

    constexpr explicit operator bool()
      requires requires { ranges::empty(derived()); } {
        return !ranges::empty(derived());
      }
    constexpr explicit operator bool() const
      requires requires { ranges::empty(derived()); } {
        return !ranges::empty(derived());
      }

    constexpr auto data() requires contiguous_iterator<iterator_t<D>> {
      return to_address(ranges::begin(derived()));
    }
```

```
    constexpr auto data() const
      requires range<const D> && contiguous_iterator<iterator_t<const D>> {
        return to_address(ranges::begin(derived()));
      }

    constexpr auto size() requires forward_range<D> &&
      sized_sentinel_for<sentinel_t<D>, iterator_t<D>> {
        return ranges::end(derived()) - ranges::begin(derived());
      }
    constexpr auto size() const requires forward_range<const D> &&
      sized_sentinel_for<sentinel_t<const D>, iterator_t<const D>> {
        return ranges::end(derived()) - ranges::begin(derived());
      }

    constexpr decltype(auto) front() requires forward_range<D>;
    constexpr decltype(auto) front() const requires forward_range<const D>;

    constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
    constexpr decltype(auto) back() const
      requires bidirectional_range<const D> && common_range<const D>;

    template<random_access_range R = D>
      constexpr decltype(auto) operator[](range_difference_t<R> n) {
        return ranges::begin(derived())[n];
      }
    template<random_access_range R = const D>
      constexpr decltype(auto) operator[](range_difference_t<R> n) const {
        return ranges::begin(derived())[n];
      }
  };
}
```

2 The template parameter D for `view_interface` may be an incomplete type. Before any member of the resulting specialization of `view_interface` other than special member functions is referenced, D shall be complete, and model both `derived_from<view_interface<D>>` and `view`.

24.5.3.2 Members [view.interface.members]

```
constexpr decltype(auto) front() requires forward_range<D>;
constexpr decltype(auto) front() const requires forward_range<const D>;
```

1 *Preconditions*: `!empty()`.

2 *Effects*: Equivalent to: `return *ranges::begin(derived());`

```
constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
constexpr decltype(auto) back() const
  requires bidirectional_range<const D> && common_range<const D>;
```

3 *Preconditions*: `!empty()`.

4 *Effects*: Equivalent to: `return *ranges::prev(ranges::end(derived()));`

24.5.4 Sub-ranges [range.subrange]

24.5.4.1 General [range.subrange.general]

1 The `subrange` class template combines together an iterator and a sentinel into a single object that models the `view` concept. Additionally, it models the `sized_range` concept when the final template parameter is `subrange_kind::sized`.

```
namespace std::ranges {
  template<class From, class To>
    concept convertible-to-non-slicing =                    // exposition only
      convertible_to<From, To> &&
      !(is_pointer_v<decay_t<From>> &&
        is_pointer_v<decay_t<To>> &&
        not-same-as<remove_pointer_t<decay_t<From>>, remove_pointer_t<decay_t<To>>>);
```

```
template<class T>
  concept pair-like =                                   // exposition only
    !is_reference_v<T> && requires(T t) {
      typename tuple_size<T>::type;                     // ensures tuple_size<T> is complete
      requires derived_from<tuple_size<T>, integral_constant<size_t, 2>>;
      typename tuple_element_t<0, remove_const_t<T>>;
      typename tuple_element_t<1, remove_const_t<T>>;
      { get<0>(t) } -> convertible_to<const tuple_element_t<0, T>&>;
      { get<1>(t) } -> convertible_to<const tuple_element_t<1, T>&>;
    };

template<class T, class U, class V>
  concept pair-like-convertible-from =                  // exposition only
    !range<T> && pair-like<T> &&
    constructible_from<T, U, V> &&
    convertible-to-non-slicing<U, tuple_element_t<0, T>> &&
    convertible_to<V, tuple_element_t<1, T>>;

template<class T>
  concept iterator-sentinel-pair =                      // exposition only
    !range<T> && pair-like<T> &&
    sentinel_for<tuple_element_t<1, T>, tuple_element_t<0, T>>;

template<input_or_output_iterator I, sentinel_for<I> S = I, subrange_kind K =
    sized_sentinel_for<S, I> ? subrange_kind::sized : subrange_kind::unsized>
  requires (K == subrange_kind::sized || !sized_sentinel_for<S, I>)
class subrange : public view_interface<subrange<I, S, K>> {
private:
  static constexpr bool StoreSize =                         // exposition only
    K == subrange_kind::sized && !sized_sentinel_for<S, I>;
  I begin_ = I();                                           // exposition only
  S end_ = S();                                             // exposition only
  make-unsigned-like-t<iter_difference_t<I>> size_ = 0;     // exposition only; present only
                                                            // when StoreSize is true
public:
  subrange() = default;

  constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);

  constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
                     make-unsigned-like-t<iter_difference_t<I>> n)
    requires (K == subrange_kind::sized);

  template<not-same-as<subrange> R>
    requires borrowed_range<R> &&
             convertible-to-non-slicing<iterator_t<R>, I> &&
             convertible_to<sentinel_t<R>, S>
  constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);

  template<borrowed_range R>
    requires convertible-to-non-slicing<iterator_t<R>, I> &&
             convertible_to<sentinel_t<R>, S>
  constexpr subrange(R&& r, make-unsigned-like-t<iter_difference_t<I>> n)
    requires (K == subrange_kind::sized)
      : subrange{ranges::begin(r), ranges::end(r), n}
  {}

  template<not-same-as<subrange> PairLike>
    requires pair-like-convertible-from<PairLike, const I&, const S&>
  constexpr operator PairLike() const;

  constexpr I begin() const requires copyable<I>;
  [[nodiscard]] constexpr I begin() requires (!copyable<I>);
  constexpr S end() const;
```

```
    constexpr bool empty() const;
    constexpr make-unsigned-like-t<iter_difference_t<I>> size() const
      requires (K == subrange_kind::sized);

    [[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const &
      requires forward_iterator<I>;
    [[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) &&;
    [[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const
      requires bidirectional_iterator<I>;
    constexpr subrange& advance(iter_difference_t<I> n);
  };

  template<input_or_output_iterator I, sentinel_for<I> S>
    subrange(I, S) -> subrange<I, S>;

  template<input_or_output_iterator I, sentinel_for<I> S>
    subrange(I, S, make-unsigned-like-t<iter_difference_t<I>>) ->
      subrange<I, S, subrange_kind::sized>;

  template<iterator-sentinel-pair P>
    subrange(P) -> subrange<tuple_element_t<0, P>, tuple_element_t<1, P>>;

  template<iterator-sentinel-pair P>
    subrange(P, make-unsigned-like-t<iter_difference_t<tuple_element_t<0, P>>>) ->
      subrange<tuple_element_t<0, P>, tuple_element_t<1, P>, subrange_kind::sized>;

  template<borrowed_range R>
    subrange(R&&) ->
      subrange<iterator_t<R>, sentinel_t<R>,
               (sized_range<R> || sized_sentinel_for<sentinel_t<R>, iterator_t<R>>)
                 ? subrange_kind::sized : subrange_kind::unsized>;

  template<borrowed_range R>
    subrange(R&&, make-unsigned-like-t<range_difference_t<R>>) ->
      subrange<iterator_t<R>, sentinel_t<R>, subrange_kind::sized>;

  template<size_t N, class I, class S, subrange_kind K>
    requires (N < 2)
    constexpr auto get(const subrange<I, S, K>& r);

  template<size_t N, class I, class S, subrange_kind K>
    requires (N < 2)
    constexpr auto get(subrange<I, S, K>&& r);
}

namespace std {
  using ranges::get;
}
```

24.5.4.2 Constructors and conversions [range.subrange.ctor]

```
constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);
```

1 *Preconditions*: `[i, s)` is a valid range.

2 *Effects*: Initializes *`begin_`* with `std::move(i)` and *`end_`* with `s`.

```
constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
                   make-unsigned-like-t<iter_difference_t<I>> n)
  requires (K == subrange_kind::sized);
```

3 *Preconditions*: `[i, s)` is a valid range, and `n == to-unsigned-like(ranges::distance(i, s))`.

4 *Effects*: Initializes *`begin_`* with `std::move(i)` and *`end_`* with `s`. If *`StoreSize`* is `true`, initializes *`size_`* with `n`.

5 [*Note 1*: Accepting the length of the range and storing it to later return from `size()` enables `subrange` to model `sized_range` even when it stores an iterator and sentinel that do not model `sized_sentinel_for`. — *end note*]

```
template<not-same-as<subrange> R>
  requires borrowed_range<R> &&
           convertible-to-non-slicing<iterator_t<R>, I> &&
           convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);
```

6 *Effects*: Equivalent to:

(6.1) — If *`StoreSize`* is `true`, `subrange{r, ranges::size(r)}`.

(6.2) — Otherwise, `subrange{ranges::begin(r), ranges::end(r)}`.

```
template<not-same-as<subrange> PairLike>
  requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;
```

7 *Effects*: Equivalent to: `return PairLike(begin_, end_);`

24.5.4.3 Accessors [range.subrange.access]

```
constexpr I begin() const requires copyable<I>;
```

1 *Effects*: Equivalent to: `return begin_;`

```
[[nodiscard]] constexpr I begin() requires (!copyable<I>);
```

2 *Effects*: Equivalent to: `return std::move(begin_);`

```
constexpr S end() const;
```

3 *Effects*: Equivalent to: `return end_;`

```
constexpr bool empty() const;
```

4 *Effects*: Equivalent to: `return begin_ == end_;`

```
constexpr make-unsigned-like-t<iter_difference_t<I>> size() const
  requires (K == subrange_kind::sized);
```

5 *Effects*:

(5.1) — If *`StoreSize`* is `true`, equivalent to: `return size_;`

(5.2) — Otherwise, equivalent to: `return to-unsigned-like(end_ - begin_);`

```
[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const &
  requires forward_iterator<I>;
```

6 *Effects*: Equivalent to:

```
auto tmp = *this;
tmp.advance(n);
return tmp;
```

```
[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) &&;
```

7 *Effects*: Equivalent to:

```
advance(n);
return std::move(*this);
```

```
[[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const
  requires bidirectional_iterator<I>;
```

8 *Effects*: Equivalent to:

```
auto tmp = *this;
tmp.advance(-n);
return tmp;
```

```
constexpr subrange& advance(iter_difference_t<I> n);
```

9 *Effects*: Equivalent to:

(9.1) — If *StoreSize* is true,

```
auto d = n - ranges::advance(begin_, n, end_);
if (d >= 0)
  size_ -= to-unsigned-like(d);
else
  size_ += to-unsigned-like(-d);
return *this;
```

(9.2) — Otherwise,

```
ranges::advance(begin_, n, end_);
return *this;
```

```
template<size_t N, class I, class S, subrange_kind K>
  requires (N < 2)
  constexpr auto get(const subrange<I, S, K>& r);
template<size_t N, class I, class S, subrange_kind K>
  requires (N < 2)
  constexpr auto get(subrange<I, S, K>&& r);
```

10 *Effects*: Equivalent to:

```
if constexpr (N == 0)
  return r.begin();
else
  return r.end();
```

24.5.5 Dangling iterator handling [range.dangling]

1 The tag type `dangling` is used together with the template aliases `borrowed_iterator_t` and `borrowed_subrange_t` to indicate that an algorithm that typically returns an iterator into or subrange of a `range` argument does not return an iterator or subrange which could potentially reference a range whose lifetime has ended for a particular rvalue `range` argument which does not model `borrowed_range` (24.4.2).

```
namespace std::ranges {
  struct dangling {
    constexpr dangling() noexcept = default;
    template<class... Args>
      constexpr dangling(Args&&...) noexcept { }
  };
}
```

2 [*Example 1*:

```
vector<int> f();
auto result1 = ranges::find(f(), 42);                              // #1
static_assert(same_as<decltype(result1), ranges::dangling>);
auto vec = f();
auto result2 = ranges::find(vec, 42);                              // #2
static_assert(same_as<decltype(result2), vector<int>::iterator>);
auto result3 = ranges::find(subrange{vec}, 42);                    // #3
static_assert(same_as<decltype(result3), vector<int>::iterator>);
```

The call to `ranges::find` at #1 returns `ranges::dangling` since `f()` is an rvalue `vector`; the `vector` could potentially be destroyed before a returned iterator is dereferenced. However, the calls at #2 and #3 both return iterators since the lvalue `vec` and specializations of `subrange` model `borrowed_range`. — *end example*]

24.6 Range factories [range.factories]

24.6.1 General [range.factories.general]

1 Subclause 24.6 defines *range factories*, which are utilities to create a `view`.

2 Range factories are declared in namespace `std::ranges::views`.

24.6.2 Empty view [range.empty]

24.6.2.1 Overview [range.empty.overview]

1 `empty_view` produces a `view` of no elements of a particular type.

2 [*Example 1*:

```
empty_view<int> e;
static_assert(ranges::empty(e));
static_assert(0 == e.size());
```

— *end example*]

24.6.2.2 Class template `empty_view` [range.empty.view]

```
namespace std::ranges {
  template<class T>
    requires is_object_v<T>
  class empty_view : public view_interface<empty_view<T>> {
  public:
    static constexpr T* begin() noexcept { return nullptr; }
    static constexpr T* end() noexcept { return nullptr; }
    static constexpr T* data() noexcept { return nullptr; }
    static constexpr size_t size() noexcept { return 0; }
    static constexpr bool empty() noexcept { return true; }
  };
}
```

24.6.3 Single view [range.single]

24.6.3.1 Overview [range.single.overview]

1 `single_view` produces a `view` that contains exactly one element of a specified value.

2 The name `views::single` denotes a customization point object (16.3.3.3.6). Given a subexpression `E`, the expression `views::single(E)` is expression-equivalent to `single_view{E}`.

3 [*Example 1*:

```
single_view s{4};
for (int i : s)
  cout << i;          // prints 4
```

— *end example*]

24.6.3.2 Class template `single_view` [range.single.view]

```
namespace std::ranges {
  template<copy_constructible T>
    requires is_object_v<T>
  class single_view : public view_interface<single_view<T>> {
  private:
    semiregular-box<T> value_;        // exposition only (see 24.7.3)
  public:
    single_view() = default;
    constexpr explicit single_view(const T& t);
    constexpr explicit single_view(T&& t);
    template<class... Args>
      requires constructible_from<T, Args...>
    constexpr single_view(in_place_t, Args&&... args);

    constexpr T* begin() noexcept;
    constexpr const T* begin() const noexcept;
    constexpr T* end() noexcept;
    constexpr const T* end() const noexcept;
    static constexpr size_t size() noexcept;
    constexpr T* data() noexcept;
    constexpr const T* data() const noexcept;
  };
}
```

```
constexpr explicit single_view(const T& t);
```

1 *Effects*: Initializes *`value_`* with `t`.

```
constexpr explicit single_view(T&& t);
```

2 *Effects*: Initializes *`value_`* with `std::move(t)`.

```
template<class... Args>
  requires constructible_from<T, Args...>
constexpr single_view(in_place_t, Args&&... args);
```

3 *Effects*: Initializes *value_* as if by *value_*{in_place, std::forward<Args>(args)...}.

```
constexpr T* begin() noexcept;
constexpr const T* begin() const noexcept;
```

4 *Effects*: Equivalent to: return data();

```
constexpr T* end() noexcept;
constexpr const T* end() const noexcept;
```

5 *Effects*: Equivalent to: return data() + 1;

```
static constexpr size_t size() noexcept;
```

6 *Effects*: Equivalent to: return 1;

```
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

7 *Effects*: Equivalent to: return *value_*.operator->();

24.6.4 Iota view [range.iota]

24.6.4.1 Overview [range.iota.overview]

1 iota_view generates a sequence of elements by repeatedly incrementing an initial value.

2 The name views::iota denotes a customization point object (16.3.3.3.6). Given subexpressions E and F, the expressions views::iota(E) and views::iota(E, F) are expression-equivalent to iota_view{E} and iota_view{E, F}, respectively.

3 [*Example 1*:

```
for (int i : iota_view{1, 10})
  cout << i << ' '; // prints: 1 2 3 4 5 6 7 8 9
```

— *end example*]

24.6.4.2 Class template iota_view [range.iota.view]

```
namespace std::ranges {
  template<class I>
    concept decrementable =     // exposition only
      see below;
  template<class I>
    concept advanceable =       // exposition only
      see below;

  template<weakly_incrementable W, semiregular Bound = unreachable_sentinel_t>
    requires weakly-equality-comparable-with<W, Bound> && semiregular<W>
  class iota_view : public view_interface<iota_view<W, Bound>> {
  private:
    // 24.6.4.3, class iota_view::iterator
    struct iterator;            // exposition only
    // 24.6.4.4, class iota_view::sentinel
    struct sentinel;            // exposition only
    W value_ = W();             // exposition only
    Bound bound_ = Bound();     // exposition only
  public:
    iota_view() = default;
    constexpr explicit iota_view(W value);
    constexpr iota_view(type_identity_t<W> value,
                        type_identity_t<Bound> bound);
    constexpr iota_view(iterator first, sentinel last) : iota_view(*first, last.bound_) {}

    constexpr iterator begin() const;
    constexpr auto end() const;
    constexpr iterator end() const requires same_as<W, Bound>;
```

```
    constexpr auto size() const requires see below;
  };

  template<class W, class Bound>
    requires (!is-integer-like<W> || !is-integer-like<Bound> ||
              (is-signed-integer-like<W> == is-signed-integer-like<Bound>))
    iota_view(W, Bound) -> iota_view<W, Bound>;
}
```

1 Let *IOTA-DIFF-T*(`W`) be defined as follows:

(1.1) — If `W` is not an integral type, or if it is an integral type and `sizeof(iter_difference_t<W>)` is greater than `sizeof(W)`, then *IOTA-DIFF-T*(`W`) denotes `iter_difference_t<W>`.

(1.2) — Otherwise, *IOTA-DIFF-T*(`W`) is a signed integer type of width greater than the width of `W` if such a type exists.

(1.3) — Otherwise, *IOTA-DIFF-T*(`W`) is an unspecified signed-integer-like type (23.3.4.4) of width not less than the width of `W`.

[*Note 1*: It is unspecified whether this type satisfies `weakly_incrementable`. — *end note*]

2 The exposition-only *decrementable* concept is equivalent to:

```
template<class I>
  concept decrementable =
    incrementable<I> && requires(I i) {
      { --i } -> same_as<I&>;
      { i-- } -> same_as<I>;
    };
```

3 When an object is in the domain of both pre- and post-decrement, the object is said to be *decrementable*.

4 Let `a` and `b` be equal objects of type `I`. `I` models *decrementable* only if

(4.1) — If `a` and `b` are decrementable, then the following are all true:

(4.1.1) — `addressof(--a) == addressof(a)`

(4.1.2) — `bool(a-- == b)`

(4.1.3) — `bool(((void)a--, a) == --b)`

(4.1.4) — `bool(++(--a) == b)`.

(4.2) — If `a` and `b` are incrementable, then `bool(--(++a) == b)`.

5 The exposition-only *advanceable* concept is equivalent to:

```
template<class I>
  concept advanceable =
    decrementable<I> && totally_ordered<I> &&
    requires(I i, const I j, const IOTA-DIFF-T(I) n) {
      { i += n } -> same_as<I&>;
      { i -= n } -> same_as<I&>;
      I(j + n);
      I(n + j);
      I(j - n);
      { j - j } -> convertible_to<IOTA-DIFF-T(I)>;
    };
```

Let `D` be *IOTA-DIFF-T*(`I`). Let `a` and `b` be objects of type `I` such that `b` is reachable from `a` after `n` applications of `++a`, for some value `n` of type `D`. `I` models *advanceable* only if

(5.1) — `(a += n)` is equal to `b`.

(5.2) — `addressof(a += n)` is equal to `addressof(a)`.

(5.3) — `I(a + n)` is equal to `(a += n)`.

(5.4) — For any two positive values `x` and `y` of type `D`, if `I(a + D(x + y))` is well-defined, then `I(a + D(x + y))` is equal to `I(I(a + x) + y)`.

(5.5) — `I(a + D(0))` is equal to `a`.

(5.6) — If `I(a + D(n - 1))` is well-defined, then `I(a + n)` is equal to `[](I c) { return ++c; }(I(a + D(n - 1)))`.

(5.7) — `(b += -n)` is equal to `a`.

(5.8) — `(b -= n)` is equal to `a`.

(5.9) — `addressof(b -= n)` is equal to `addressof(b)`.

(5.10) — `I(b - n)` is equal to `(b -= n)`.

(5.11) — `D(b - a)` is equal to `n`.

(5.12) — `D(a - b)` is equal to `D(-n)`.

(5.13) — `bool(a <= b)` is `true`.

```
constexpr explicit iota_view(W value);
```

6 *Preconditions*: `Bound` denotes `unreachable_sentinel_t` or `Bound()` is reachable from `value`.

7 *Effects*: Initializes *`value_`* with `value`.

```
constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
```

8 *Preconditions*: `Bound` denotes `unreachable_sentinel_t` or `bound` is reachable from `value`. When `W` and `Bound` model `totally_ordered_with`, then `bool(value <= bound)` is `true`.

9 *Effects*: Initializes *`value_`* with `value` and *`bound_`* with `bound`.

```
constexpr iterator begin() const;
```

10 *Effects*: Equivalent to: `return iterator{value_};`

```
constexpr auto end() const;
```

11 *Effects*: Equivalent to:

```
if constexpr (same_as<Bound, unreachable_sentinel_t>)
  return unreachable_sentinel;
else
  return sentinel{bound_};
```

```
constexpr iterator end() const requires same_as<W, Bound>;
```

12 *Effects*: Equivalent to: `return iterator{bound_};`

```
constexpr auto size() const requires see below;
```

13 *Effects*: Equivalent to:

```
if constexpr (is-integer-like<W> && is-integer-like<Bound>)
  return (value_ < 0)
    ? ((bound_ < 0)
      ? to-unsigned-like(-value_) - to-unsigned-like(-bound_)
      : to-unsigned-like(bound_) + to-unsigned-like(-value_))
    : to-unsigned-like(bound_) - to-unsigned-like(value_);
else
  return to-unsigned-like(bound_ - value_);
```

14 *Remarks*: The expression in the *requires-clause* is equivalent to:

```
(same_as<W, Bound> && advanceable<W>) || (integral<W> && integral<Bound>) ||
  sized_sentinel_for<Bound, W>
```

24.6.4.3 Class `iota_view::iterator` [range.iota.iterator]

```
namespace std::ranges {
  template<weakly_incrementable W, semiregular Bound>
    requires weakly-equality-comparable-with<W, Bound>
  struct iota_view<W, Bound>::iterator {
  private:
    W value_ = W();              // exposition only
  public:
    using iterator_concept = see below;
    using iterator_category = input_iterator_tag;
```

```
      using value_type = W;
      using difference_type = IOTA-DIFF-T(W);

      iterator() = default;
      constexpr explicit iterator(W value);

      constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);

      constexpr iterator& operator++();
      constexpr void operator++(int);
      constexpr iterator operator++(int) requires incrementable<W>;

      constexpr iterator& operator--() requires decrementable<W>;
      constexpr iterator operator--(int) requires decrementable<W>;

      constexpr iterator& operator+=(difference_type n)
        requires advanceable<W>;
      constexpr iterator& operator-=(difference_type n)
        requires advanceable<W>;
      constexpr W operator[](difference_type n) const
        requires advanceable<W>;

      friend constexpr bool operator==(const iterator& x, const iterator& y)
        requires equality_comparable<W>;

      friend constexpr bool operator<(const iterator& x, const iterator& y)
        requires totally_ordered<W>;
      friend constexpr bool operator>(const iterator& x, const iterator& y)
        requires totally_ordered<W>;
      friend constexpr bool operator<=(const iterator& x, const iterator& y)
        requires totally_ordered<W>;
      friend constexpr bool operator>=(const iterator& x, const iterator& y)
        requires totally_ordered<W>;
      friend constexpr auto operator<=>(const iterator& x, const iterator& y)
        requires totally_ordered<W> && three_way_comparable<W>;

      friend constexpr iterator operator+(iterator i, difference_type n)
        requires advanceable<W>;
      friend constexpr iterator operator+(difference_type n, iterator i)
        requires advanceable<W>;

      friend constexpr iterator operator-(iterator i, difference_type n)
        requires advanceable<W>;
      friend constexpr difference_type operator-(const iterator& x, const iterator& y)
        requires advanceable<W>;
    };
  }
```

1 *iterator*::iterator_concept is defined as follows:

(1.1) — If W models *advanceable*, then iterator_concept is random_access_iterator_tag.

(1.2) — Otherwise, if W models *decrementable*, then iterator_concept is bidirectional_iterator_tag.

(1.3) — Otherwise, if W models incrementable, then iterator_concept is forward_iterator_tag.

(1.4) — Otherwise, iterator_concept is input_iterator_tag.

2 [*Note 1*: Overloads for iter_move and iter_swap are omitted intentionally. — *end note*]

```
constexpr explicit iterator(W value);
```

3 *Effects*: Initializes *value_* with value.

```
constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);
```

4 *Effects*: Equivalent to: return *value_*;

5 [*Note 2*: The noexcept clause is needed by the default iter_move implementation. — *end note*]

```
constexpr iterator& operator++();
```

6 *Effects*: Equivalent to:

```
++value_;
return *this;
```

```
constexpr void operator++(int);
```

7 *Effects*: Equivalent to `++*this`.

```
constexpr iterator operator++(int) requires incrementable<W>;
```

8 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires decrementable<W>;
```

9 *Effects*: Equivalent to:

```
--value_;
return *this;
```

```
constexpr iterator operator--(int) requires decrementable<W>;
```

10 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type n)
  requires advanceable<W>;
```

11 *Effects*: Equivalent to:

```
if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
  if (n >= difference_type(0))
    value_ += static_cast<W>(n);
  else
    value_ -= static_cast<W>(-n);
} else {
  value_ += n;
}
return *this;
```

```
constexpr iterator& operator-=(difference_type n)
  requires advanceable<W>;
```

12 *Effects*: Equivalent to:

```
if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
  if (n >= difference_type(0))
    value_ -= static_cast<W>(n);
  else
    value_ += static_cast<W>(-n);
} else {
  value_ -= n;
}
return *this;
```

```
constexpr W operator[](difference_type n) const
  requires advanceable<W>;
```

13 *Effects*: Equivalent to: `return W(value_ + n);`

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<W>;
```

14 *Effects*: Equivalent to: `return x.value_ == y.value_;`

```
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
```

15 *Effects*: Equivalent to: `return x.value_ < y.value_;`

```
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
```

16 *Effects*: Equivalent to: `return y < x;`

```
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
```

17 *Effects*: Equivalent to: `return !(y < x);`

```
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
```

18 *Effects*: Equivalent to: `return !(x < y);`

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires totally_ordered<W> && three_way_comparable<W>;
```

19 *Effects*: Equivalent to: `return x.value_ <=> y.value_;`

```
friend constexpr iterator operator+(iterator i, difference_type n)
  requires advanceable<W>;
```

20 *Effects*: Equivalent to: `return i += n;`

```
friend constexpr iterator operator+(difference_type n, iterator i)
  requires advanceable<W>;
```

21 *Effects*: Equivalent to: `return i + n;`

```
friend constexpr iterator operator-(iterator i, difference_type n)
  requires advanceable<W>;
```

22 *Effects*: Equivalent to: `return i -= n;`

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires advanceable<W>;
```

23 *Effects*: Equivalent to:

```
using D = difference_type;
if constexpr (is-integer-like<W>) {
  if constexpr (is-signed-integer-like<W>)
    return D(D(x.value_) - D(y.value_));
  else
    return (y.value_ > x.value_)
      ? D(-D(y.value_ - x.value_))
      : D(x.value_ - y.value_);
} else {
  return x.value_ - y.value_;
}
```

24.6.4.4 Class iota_view::*sentinel* [range.iota.sentinel]

```
namespace std::ranges {
  template<weakly_incrementable W, semiregular Bound>
    requires weakly-equality-comparable-with<W, Bound>
  struct iota_view<W, Bound>::sentinel {
  private:
    Bound bound_ = Bound();      // exposition only
  public:
    sentinel() = default;
    constexpr explicit sentinel(Bound bound);

    friend constexpr bool operator==(const iterator& x, const sentinel& y);
```

```
      friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
        requires sized_sentinel_for<Bound, W>;
      friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
        requires sized_sentinel_for<Bound, W>;
    };
  }
```

```
constexpr explicit sentinel(Bound bound);
```

1 *Effects*: Initializes `bound_` with `bound`.

```
friend constexpr bool operator==(const iterator& x, const sentinel& y);
```

2 *Effects*: Equivalent to: `return x.value_ == y.bound_;`

```
friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
  requires sized_sentinel_for<Bound, W>;
```

3 *Effects*: Equivalent to: `return x.value_ - y.bound_;`

```
friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
  requires sized_sentinel_for<Bound, W>;
```

4 *Effects*: Equivalent to: `return -(y - x);`

24.6.5 Istream view [range.istream]

24.6.5.1 Overview [range.istream.overview]

1 `basic_istream_view` models `input_range` and reads (using `operator>>`) successive elements from its corresponding input stream.

2 [*Example 1*:

```
auto ints = istringstream{"0 1  2   3     4"};
ranges::copy(ranges::istream_view<int>(ints), ostream_iterator<int>{cout, "-"});
// prints 0-1-2-3-4-
```

— *end example*]

24.6.5.2 Class template `basic_istream_view` [range.istream.view]

```
namespace std::ranges {
  template<class Val, class CharT, class Traits>
    concept stream-extractable =                  // exposition only
      requires(basic_istream<CharT, Traits>& is, Val& t) {
         is >> t;
      };

  template<movable Val, class CharT, class Traits>
    requires default_initializable<Val> &&
             stream-extractable<Val, CharT, Traits>
  class basic_istream_view : public view_interface<basic_istream_view<Val, CharT, Traits>> {
  public:
    basic_istream_view() = default;
    constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);

    constexpr auto begin()
    {
      if (stream_) {
        *stream_ >> object_;
      }
      return iterator{*this};
    }

    constexpr default_sentinel_t end() const noexcept;

  private:
    struct iterator;                                    // exposition only
    basic_istream<CharT, Traits>* stream_ = nullptr;    // exposition only
    Val object_ = Val();                                // exposition only
```

```
  };
}
```

```
constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);
```

1 *Effects*: Initializes *stream_* with addressof(stream).

```
constexpr default_sentinel_t end() const noexcept;
```

2 *Effects*: Equivalent to: return default_sentinel;

```
template<class Val, class CharT, class Traits>
basic_istream_view<Val, CharT, Traits> istream_view(basic_istream<CharT, Traits>& s);
```

3 *Effects*: Equivalent to: return basic_istream_view<Val, CharT, Traits>{s};

24.6.5.3 Class template basic_istream_view::*iterator* [range.istream.iterator]

```
namespace std::ranges {
  template<movable Val, class CharT, class Traits>
    requires default_initializable<Val> &&
             stream-extractable<Val, CharT, Traits>
  class basic_istream_view<Val, CharT, Traits>::iterator {      // exposition only
  public:
    using iterator_concept = input_iterator_tag;
    using difference_type = ptrdiff_t;
    using value_type = Val;

    iterator() = default;
    constexpr explicit iterator(basic_istream_view& parent) noexcept;

    iterator(const iterator&) = delete;
    iterator(iterator&&) = default;

    iterator& operator=(const iterator&) = delete;
    iterator& operator=(iterator&&) = default;

    iterator& operator++();
    void operator++(int);

    Val& operator*() const;

    friend bool operator==(const iterator& x, default_sentinel_t);

  private:
    basic_istream_view* parent_ = nullptr;                     // exposition only
  };
}
```

```
constexpr explicit iterator(basic_istream_view& parent) noexcept;
```

1 *Effects*: Initializes *parent_* with addressof(parent).

```
iterator& operator++();
```

2 *Preconditions*: *parent_*->*stream_* != nullptr is true.

3 *Effects*: Equivalent to:

```
*parent_->stream_ >> parent_->object_;
return *this;
```

```
void operator++(int);
```

4 *Preconditions*: *parent_*->*stream_* != nullptr is true.

5 *Effects*: Equivalent to ++*this.

```
Val& operator*() const;
```

6 *Preconditions*: *parent_*->*stream_* != nullptr is true.

7 *Effects*: Equivalent to: `return parent_->object_;`

```
friend bool operator==(const iterator& x, default_sentinel_t);
```

8 *Effects*: Equivalent to: `return x.parent_ == nullptr || !*x.parent_->stream_;`

24.7 Range adaptors [range.adaptors]

24.7.1 General [range.adaptors.general]

1 Subclause 24.7 defines *range adaptors*, which are utilities that transform a `range` into a `view` with custom behaviors. These adaptors can be chained to create pipelines of range transformations that evaluate lazily as the resulting view is iterated.

2 Range adaptors are declared in namespace `std::ranges::views`.

3 The bitwise OR operator is overloaded for the purpose of creating adaptor chain pipelines. The adaptors also support function call syntax with equivalent semantics.

4 [*Example 1*:

```
vector<int> ints{0,1,2,3,4,5};
auto even = [](int i){ return 0 == i % 2; };
auto square = [](int i) { return i * i; };
for (int i : ints | views::filter(even) | views::transform(square)) {
  cout << i << ' '; // prints: 0 4 16
}
assert(ranges::equal(ints | views::filter(even), views::filter(ints, even)));
```

— *end example*]

24.7.2 Range adaptor objects [range.adaptor.object]

1 A *range adaptor closure object* is a unary function object that accepts a `viewable_range` argument and returns a `view`. For a range adaptor closure object `C` and an expression `R` such that `decltype((R))` models `viewable_range`, the following expressions are equivalent and yield a `view`:

```
C(R)
R | C
```

Given an additional range adaptor closure object `D`, the expression `C | D` is well-formed and produces another range adaptor closure object such that the following two expressions are equivalent:

```
R | C | D
R | (C | D)
```

2 A *range adaptor object* is a customization point object (16.3.3.3.6) that accepts a `viewable_range` as its first argument and returns a `view`.

3 If a range adaptor object accepts only one argument, then it is a range adaptor closure object.

4 If a range adaptor object accepts more than one argument, then the following expressions are equivalent:

```
adaptor(range, args...)
adaptor(args...)(range)
range | adaptor(args...)
```

In this case, `adaptor(args...)` is a range adaptor closure object.

24.7.3 Semiregular wrapper [range.semi.wrap]

1 Many types in this subclause are specified in terms of an exposition-only class template *`semiregular-box`*. *`semiregular-box`*`<T>` behaves exactly like `optional<T>` with the following differences:

(1.1) — *`semiregular-box`*`<T>` constrains its type parameter `T` with `copy_constructible<T> && is_object_v<T>`.

(1.2) — If `T` models `default_initializable`, the default constructor of *`semiregular-box`*`<T>` is equivalent to:

```
constexpr semiregular-box() noexcept(is_nothrow_default_constructible_v<T>)
  : semiregular-box{in_place}
{ }
```

(1.3) — If `assignable_from<T&, const T&>` is not modeled, the copy assignment operator is equivalent to:

```
semiregular-box& operator=(const semiregular-box& that)
  noexcept(is_nothrow_copy_constructible_v<T>)
{
  if (that) emplace(*that);
  else reset();
  return *this;
}
```

(1.4) — If `assignable_from<T&, T>` is not modeled, the move assignment operator is equivalent to:

```
semiregular-box& operator=(semiregular-box&& that)
  noexcept(is_nothrow_move_constructible_v<T>)
{
  if (that) emplace(std::move(*that));
  else reset();
  return *this;
}
```

24.7.4 All view [range.all]

24.7.4.1 General [range.all.general]

1 `views::all` returns a `view` that includes all elements of its `range` argument.

2 The name `views::all` denotes a range adaptor object (24.7.2). Given a subexpression `E`, the expression `views::all(E)` is expression-equivalent to:

(2.1) — *`decay-copy`*`(E)` if the decayed type of `E` models `view`.

(2.2) — Otherwise, `ref_view{E}` if that expression is well-formed.

(2.3) — Otherwise, `subrange{E}`.

24.7.4.2 Class template `ref_view` [range.ref.view]

1 `ref_view` is a `view` of the elements of some other `range`.

```
namespace std::ranges {
  template<range R>
    requires is_object_v<R>
  class ref_view : public view_interface<ref_view<R>> {
  private:
    R* r_ = nullptr;              // exposition only
  public:
    constexpr ref_view() noexcept = default;

    template<not-same-as<ref_view> T>
      requires see below
    constexpr ref_view(T&& t);

    constexpr R& base() const { return *r_; }

    constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
    constexpr sentinel_t<R> end() const { return ranges::end(*r_); }

    constexpr bool empty() const
      requires requires { ranges::empty(*r_); }
    { return ranges::empty(*r_); }

    constexpr auto size() const requires sized_range<R>
    { return ranges::size(*r_); }

    constexpr auto data() const requires contiguous_range<R>
    { return ranges::data(*r_); }
  };
  template<class R>
    ref_view(R&) -> ref_view<R>;
}
```

```
template<not-same-as<ref_view> T>
  requires see below
constexpr ref_view(T&& t);
```

2 *Effects*: Initializes *r_* with `addressof(static_cast<R&>(std::forward<T>(t)))`.

3 *Remarks*: Let *FUN* denote the exposition-only functions

```
void FUN(R&);
void FUN(R&&) = delete;
```

The expression in the *requires-clause* is equivalent to:

```
convertible_to<T, R&> && requires { FUN(declval<T>()); }
```

24.7.5 Filter view [range.filter]

24.7.5.1 Overview [range.filter.overview]

1 `filter_view` presents a `view` of the elements of an underlying sequence that satisfy a predicate.

2 The name `views::filter` denotes a range adaptor object (24.7.2). Given subexpressions `E` and `P`, the expression `views::filter(E, P)` is expression-equivalent to `filter_view{E, P}`.

3 [*Example 1*:

```
vector<int> is{ 0, 1, 2, 3, 4, 5, 6 };
filter_view evens{is, [](int i) { return 0 == i % 2; }};
for (int i : evens)
  cout << i << ' '; // prints: 0 2 4 6
```

— *end example*]

24.7.5.2 Class template `filter_view` [range.filter.view]

```
namespace std::ranges {
  template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
  class filter_view : public view_interface<filter_view<V, Pred>> {
  private:
    V base_ = V();                          // exposition only
    semiregular-box<Pred> pred_;   // exposition only

    // 24.7.5.3, class filter_view::iterator
    class iterator;                         // exposition only
    // 24.7.5.4, class filter_view::sentinel
    class sentinel;                         // exposition only

  public:
    filter_view() = default;
    constexpr filter_view(V base, Pred pred);

    constexpr V base() const& requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr const Pred& pred() const;

    constexpr iterator begin();
    constexpr auto end() {
      if constexpr (common_range<V>)
        return iterator{*this, ranges::end(base_)};
      else
        return sentinel{*this};
    }
  };

  template<class R, class Pred>
    filter_view(R&&, Pred) -> filter_view<views::all_t<R>, Pred>;
}
```

```
constexpr filter_view(V base, Pred pred);
```

1 *Effects*: Initializes *base_* with `std::move(base)` and initializes *pred_* with `std::move(pred)`.

```
constexpr const Pred& pred() const;
```

2 *Effects*: Equivalent to: `return *pred_;`

```
constexpr iterator begin();
```

3 *Preconditions*: `pred_.has_value()`.

4 *Returns*: `{*this, ranges::find_if(base_, ref(*pred_))}`.

5 *Remarks*: In order to provide the amortized constant time complexity required by the `range` concept when `filter_view` models `forward_range`, this function caches the result within the `filter_view` for use on subsequent calls.

24.7.5.3 Class `filter_view::iterator` [range.filter.iterator]

```
namespace std::ranges {
  template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
  class filter_view<V, Pred>::iterator {
  private:
    iterator_t<V> current_ = iterator_t<V>();   // exposition only
    filter_view* parent_ = nullptr;             // exposition only
  public:
    using iterator_concept  = see below;
    using iterator_category = see below;
    using value_type        = range_value_t<V>;
    using difference_type   = range_difference_t<V>;

    iterator() = default;
    constexpr iterator(filter_view& parent, iterator_t<V> current);

    constexpr iterator_t<V> base() const &
      requires copyable<iterator_t<V>>;
    constexpr iterator_t<V> base() &&;
    constexpr range_reference_t<V> operator*() const;
    constexpr iterator_t<V> operator->() const
      requires has-arrow<iterator_t<V>> && copyable<iterator_t<V>>;

    constexpr iterator& operator++();
    constexpr void operator++(int);
    constexpr iterator operator++(int) requires forward_range<V>;

    constexpr iterator& operator--() requires bidirectional_range<V>;
    constexpr iterator operator--(int) requires bidirectional_range<V>;

    friend constexpr bool operator==(const iterator& x, const iterator& y)
      requires equality_comparable<iterator_t<V>>;

    friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
      noexcept(noexcept(ranges::iter_move(i.current_)));
    friend constexpr void iter_swap(const iterator& x, const iterator& y)
      noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
      requires indirectly_swappable<iterator_t<V>>;
  };
}
```

1 Modification of the element a `filter_view::iterator` denotes is permitted, but results in undefined behavior if the resulting value does not satisfy the filter predicate.

2 `iterator::iterator_concept` is defined as follows:

(2.1) — If `V` models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(2.2) — Otherwise, if `V` models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.

(2.3) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

3 *iterator*::`iterator_category` is defined as follows:

(3.1) — Let `C` denote the type `iterator_traits<iterator_t<V>>::iterator_category`.

(3.2) — If `C` models `derived_from<bidirectional_iterator_tag>`, then `iterator_category` denotes `bidirectional_iterator_tag`.

(3.3) — Otherwise, if `C` models `derived_from<forward_iterator_tag>`, then `iterator_category` denotes `forward_iterator_tag`.

(3.4) — Otherwise, `iterator_category` denotes `C`.

```
constexpr iterator(filter_view& parent, iterator_t<V> current);
```

4 *Effects*: Initializes *current_* with `std::move(current)` and *parent_* with `addressof(parent)`.

```
constexpr iterator_t<V> base() const &
  requires copyable<iterator_t<V>>;
```

5 *Effects*: Equivalent to: `return current_;`

```
constexpr iterator_t<V> base() &&;
```

6 *Effects*: Equivalent to: `return std::move(current_);`

```
constexpr range_reference_t<V> operator*() const;
```

7 *Effects*: Equivalent to: `return *current_;`

```
constexpr iterator_t<V> operator->() const
  requires has-arrow<iterator_t<V>> && copyable<iterator_t<V>>;
```

8 *Effects*: Equivalent to: `return current_;`

```
constexpr iterator& operator++();
```

9 *Effects*: Equivalent to:

```
current_ = ranges::find_if(std::move(++current_), ranges::end(parent_->base_),
                           ref(*parent_->pred_));
return *this;
```

```
constexpr void operator++(int);
```

10 *Effects*: Equivalent to `++*this`.

```
constexpr iterator operator++(int) requires forward_range<V>;
```

11 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<V>;
```

12 *Effects*: Equivalent to:

```
do
  --current_;
while (!invoke(*parent_->pred_, *current_));
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<V>;
```

13 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<iterator_t<V>>;
```

14 *Effects*: Equivalent to: `return x.current_ == y.current_;`

```
friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
  noexcept(noexcept(ranges::iter_move(i.current_)));
```

15 *Effects*: Equivalent to: `return ranges::iter_move(i.current_);`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
  requires indirectly_swappable<iterator_t<V>>;
```

16 *Effects*: Equivalent to `ranges::iter_swap(x.current_, y.current_)`.

24.7.5.4 Class `filter_view::sentinel` [range.filter.sentinel]

```
namespace std::ranges {
  template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
  class filter_view<V, Pred>::sentinel {
  private:
    sentinel_t<V> end_ = sentinel_t<V>();        // exposition only
  public:
    sentinel() = default;
    constexpr explicit sentinel(filter_view& parent);

    constexpr sentinel_t<V> base() const;

    friend constexpr bool operator==(const iterator& x, const sentinel& y);
  };
}
```

```
constexpr explicit sentinel(filter_view& parent);
```

1 *Effects*: Initializes *`end_`* with `ranges::end(parent.base_)`.

```
constexpr sentinel_t<V> base() const;
```

2 *Effects*: Equivalent to: `return end_;`

```
friend constexpr bool operator==(const iterator& x, const sentinel& y);
```

3 *Effects*: Equivalent to: `return x.current_ == y.end_;`

24.7.6 Transform view [range.transform]

24.7.6.1 Overview [range.transform.overview]

1 `transform_view` presents a `view` of an underlying sequence after applying a transformation function to each element.

2 The name `views::transform` denotes a range adaptor object (24.7.2). Given subexpressions `E` and `F`, the expression `views::transform(E, F)` is expression-equivalent to `transform_view{E, F}`.

3 [*Example 1*:

```
vector<int> is{ 0, 1, 2, 3, 4 };
transform_view squares{is, [](int i) { return i * i; }};
for (int i : squares)
  cout << i << ' '; // prints: 0 1 4 9 16
```

— *end example*]

24.7.6.2 Class template `transform_view` [range.transform.view]

```
namespace std::ranges {
  template<input_range V, copy_constructible F>
    requires view<V> && is_object_v<F> &&
             regular_invocable<F&, range_reference_t<V>> &&
             can-reference<invoke_result_t<F&, range_reference_t<V>>>
  class transform_view : public view_interface<transform_view<V, F>> {
  private:
    // 24.7.6.3, class template transform_view::iterator
    template<bool> struct iterator;             // exposition only
    // 24.7.6.4, class template transform_view::sentinel
    template<bool> struct sentinel;             // exposition only
```

```
    V base_ = V();                              // exposition only
    semiregular-box<F> fun_;                    // exposition only

  public:
    transform_view() = default;
    constexpr transform_view(V base, F fun);

    constexpr V base() const& requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr iterator<false> begin();
    constexpr iterator<true> begin() const
      requires range<const V> &&
               regular_invocable<const F&, range_reference_t<const V>>;

    constexpr sentinel<false> end();
    constexpr iterator<false> end() requires common_range<V>;
    constexpr sentinel<true> end() const
      requires range<const V> &&
               regular_invocable<const F&, range_reference_t<const V>>;
    constexpr iterator<true> end() const
      requires common_range<const V> &&
               regular_invocable<const F&, range_reference_t<const V>>;

    constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
    constexpr auto size() const requires sized_range<const V>
    { return ranges::size(base_); }
  };

  template<class R, class F>
    transform_view(R&&, F) -> transform_view<views::all_t<R>, F>;
}
```

```
constexpr transform_view(V base, F fun);
```

1 *Effects*: Initializes *base_* with `std::move(base)` and *fun_* with `std::move(fun)`.

```
constexpr iterator<false> begin();
```

2 *Effects*: Equivalent to:

```
return iterator<false>{*this, ranges::begin(base_)};
```

```
constexpr iterator<true> begin() const
  requires range<const V> &&
           regular_invocable<const F&, range_reference_t<const V>>;
```

3 *Effects*: Equivalent to:

```
return iterator<true>{*this, ranges::begin(base_)};
```

```
constexpr sentinel<false> end();
```

4 *Effects*: Equivalent to:

```
return sentinel<false>{ranges::end(base_)};
```

```
constexpr iterator<false> end() requires common_range<V>;
```

5 *Effects*: Equivalent to:

```
return iterator<false>{*this, ranges::end(base_)};
```

```
constexpr sentinel<true> end() const
  requires range<const V> &&
           regular_invocable<const F&, range_reference_t<const V>>;
```

6 *Effects*: Equivalent to:

```
return sentinel<true>{ranges::end(base_)};
```

```
constexpr iterator<true> end() const
  requires common_range<const V> &&
           regular_invocable<const F&, range_reference_t<const V>>;
```

7 *Effects*: Equivalent to:

```
return iterator<true>{*this, ranges::end(base_)};
```

24.7.6.3 Class template transform_view::*iterator* [range.transform.iterator]

```
namespace std::ranges {
  template<input_range V, copy_constructible F>
    requires view<V> && is_object_v<F> &&
             regular_invocable<F&, range_reference_t<V>> &&
             can-reference<invoke_result_t<F&, range_reference_t<V>>>
  template<bool Const>
  class transform_view<V, F>::iterator {
  private:
    using Parent =                              // exposition only
      conditional_t<Const, const transform_view, transform_view>;
    using Base   =                              // exposition only
      conditional_t<Const, const V, V>;
    iterator_t<Base> current_ =                 // exposition only
      iterator_t<Base>();
    Parent* parent_ = nullptr;                  // exposition only
  public:
    using iterator_concept  = see below;
    using iterator_category = see below;
    using value_type        =
      remove_cvref_t<invoke_result_t<F&, range_reference_t<Base>>>;
    using difference_type   = range_difference_t<Base>;

    iterator() = default;
    constexpr iterator(Parent& parent, iterator_t<Base> current);
    constexpr iterator(iterator<!Const> i)
      requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

    constexpr iterator_t<Base> base() const &
      requires copyable<iterator_t<Base>>;
    constexpr iterator_t<Base> base() &&;
    constexpr decltype(auto) operator*() const
    { return invoke(*parent_->fun_, *current_); }

    constexpr iterator& operator++();
    constexpr void operator++(int);
    constexpr iterator operator++(int) requires forward_range<Base>;

    constexpr iterator& operator--() requires bidirectional_range<Base>;
    constexpr iterator operator--(int) requires bidirectional_range<Base>;

    constexpr iterator& operator+=(difference_type n)
      requires random_access_range<Base>;
    constexpr iterator& operator-=(difference_type n)
      requires random_access_range<Base>;
    constexpr decltype(auto) operator[](difference_type n) const
      requires random_access_range<Base>
    { return invoke(*parent_->fun_, current_[n]); }

    friend constexpr bool operator==(const iterator& x, const iterator& y)
      requires equality_comparable<iterator_t<Base>>;

    friend constexpr bool operator<(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator>(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
```

```
    friend constexpr bool operator<=(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator>=(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr auto operator<=>(const iterator& x, const iterator& y)
      requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

    friend constexpr iterator operator+(iterator i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr iterator operator+(difference_type n, iterator i)
      requires random_access_range<Base>;

    friend constexpr iterator operator-(iterator i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr difference_type operator-(const iterator& x, const iterator& y)
      requires random_access_range<Base>;

    friend constexpr decltype(auto) iter_move(const iterator& i)
      noexcept(noexcept(invoke(*i.parent_->fun_, *i.current_)))
    {
      if constexpr (is_lvalue_reference_v<decltype(*i)>)
        return std::move(*i);
      else
        return *i;
    }

    friend constexpr void iter_swap(const iterator& x, const iterator& y)
      noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
      requires indirectly_swappable<iterator_t<Base>>;
  };
}
```

1 `iterator::iterator_concept` is defined as follows:

(1.1) — If `V` models `random_access_range`, then `iterator_concept` denotes `random_access_iterator_tag`.

(1.2) — Otherwise, if `V` models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(1.3) — Otherwise, if `V` models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.

(1.4) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2 `iterator::iterator_category` is defined as follows: Let `C` denote the type `iterator_traits<iterator_t<Base>>::iterator_category`.

(2.1) — If `is_lvalue_reference_v<invoke_result_t<F&, range_reference_t<Base>>>` is `true`, then

(2.1.1) — if `C` models `derived_from<contiguous_iterator_tag>`, `iterator_category` denotes `random_access_iterator_tag`;

(2.1.2) — otherwise, `iterator_category` denotes `C`.

(2.2) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

```
constexpr iterator(Parent& parent, iterator_t<Base> current);
```

3 *Effects*: Initializes *`current_`* with `std::move(current)` and *`parent_`* with `addressof(parent)`.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

4 *Effects*: Initializes *`current_`* with `std::move(i.current_)` and *`parent_`* with `i.parent_`.

```
constexpr iterator_t<Base> base() const &
  requires copyable<iterator_t<Base>>;
```

5 *Effects*: Equivalent to: `return current_;`

```
constexpr iterator_t<Base> base() &&;
```

6 *Effects*: Equivalent to: `return std::move(current_);`

```
constexpr iterator& operator++();
```

7 *Effects*: Equivalent to:

```
++current_;
return *this;
```

```
constexpr void operator++(int);
```

8 *Effects*: Equivalent to `++current_`.

```

      operator-(const iterator<Const>& x, const sentinel& y)
        requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
    friend constexpr range_difference_t<Base>
      operator-(const sentinel& y, const iterator<Const>& x)
        requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
  };
}
```

```
constexpr explicit sentinel(sentinel_t<Base> end);
```

1 *Effects*: Initializes `end_` with `end`.

```
constexpr sentinel(sentinel<!Const> i)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes `end_` with `std::move(i.end_)`.

```
constexpr sentinel_t<Base> base() const;
```

3 *Effects*: Equivalent to: `return end_;`

```
friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);
```

4 *Effects*: Equivalent to: `return x.current_ == y.end_;`

```
friend constexpr range_difference_t<Base>
  operator-(const iterator<Const>& x, const sentinel& y)
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

5 *Effects*: Equivalent to: `return x.current_ - y.end_;`

```
friend constexpr range_difference_t<Base>
  operator-(const sentinel& y, const iterator<Const>& x)
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

6 *Effects*: Equivalent to: `return y.end_ - x.current_;`

24.7.7 Take view [range.take]

24.7.7.1 Overview [range.take.overview]

1 `take_view` produces a `view` of the first N elements from another `view`, or all the elements if the adapted `view` contains fewer than N.

2 The name `views::take` denotes a range adaptor object (24.7.2). Let `E` and `F` be expressions, let `T` be `remove_cvref_t<decltype((E))>`, and let `D` be `range_difference_t<decltype((E))>`. If `decltype((F))` does not model `convertible_to<D>`, `views::take(E, F)` is ill-formed. Otherwise, the expression `views::take(E, F)` is expression-equivalent to:

- (2.1) — If `T` is a specialization of `ranges::empty_view` (24.6.2.2), then `((void) F, decay-copy(E))`.
- (2.2) — Otherwise, if `T` models `random_access_range` and `sized_range` and is
  - (2.2.1) — a specialization of `span` (22.7.3) where `T::extent == dynamic_extent`,
  - (2.2.2) — a specialization of `basic_string_view` (21.4),
  - (2.2.3) — a specialization of `ranges::iota_view` (24.6.4.2), or
  - (2.2.4) — a specialization of `ranges::subrange` (24.5.4),

  then `T{ranges::begin(E), ranges::begin(E) + min<D>(ranges::size(E), F)}`, except that `E` is evaluated only once.
- (2.3) — Otherwise, `ranges::take_view{E, F}`.

3 [*Example 1*:

```
vector<int> is{0,1,2,3,4,5,6,7,8,9};
take_view few{is, 5};
for (int i : few)
  cout << i << ' '; // prints: 0 1 2 3 4
```

— *end example*]

24.7.7.2 Class template take_view [range.take.view]

```
namespace std::ranges {
  template<view V>
  class take_view : public view_interface<take_view<V>> {
  private:
    V base_ = V();                                  // exposition only
    range_difference_t<V> count_ = 0;               // exposition only
    // 24.7.7.3, class template take_view::sentinel
    template<bool> struct sentinel;                 // exposition only
  public:
    take_view() = default;
    constexpr take_view(V base, range_difference_t<V> count);

    constexpr V base() const& requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }
```

```
    constexpr auto begin() requires (!simple-view<V>) {
      if constexpr (sized_range<V>) {
        if constexpr (random_access_range<V>)
          return ranges::begin(base_);
        else {
          auto sz = size();
          return counted_iterator{ranges::begin(base_), sz};
        }
      } else
        return counted_iterator{ranges::begin(base_), count_};
    }

    constexpr auto begin() const requires range<const V> {
      if constexpr (sized_range<const V>) {
        if constexpr (random_access_range<const V>)
          return ranges::begin(base_);
        else {
          auto sz = size();
          return counted_iterator{ranges::begin(base_), sz};
        }
      } else
        return counted_iterator{ranges::begin(base_), count_};
    }

    constexpr auto end() requires (!simple-view<V>) {
      if constexpr (sized_range<V>) {

          return default_sentinel;
      } else
        return sentinel<false>{ranges::end(base_)};
    }

    constexpr auto end() const requires range<const V> {
      if constexpr (sized_range<const V>) {
        if constexpr (random_access_range<const V>)
          return ranges::begin(base_) + size();
        else
          return default_sentinel;
      } else
        return sentinel<true>{ranges::end(base_)};
    }

    constexpr auto size() requires sized_range<V> {
      auto n = ranges::size(base_);
      return ranges::min(n, static_cast<decltype(n)>(count_));
    }

    constexpr auto size() const requires sized_range<const V> {
      auto n = ranges::size(base_);
      return ranges::min(n, static_cast<decltype(n)>(count_));
    }
  };

  template<range R>
    take_view(R&&, range_difference_t<R>)
      -> take_view<views::all_t<R>>;
}
```

```
constexpr take_view(V base, range_difference_t<V> count);
```

1 *Effects*: Initializes *base_* with `std::move(base)` and *count_* with `count`.

24.7.7.3 Class template take_view::*sentinel* [range.take.sentinel]

```
namespace std::ranges {
  template<view V>
  template<bool Const>
  class take_view<V>::sentinel {
  private:
    using Base = conditional_t<Const, const V, V>;        // exposition only
    using CI = counted_iterator<iterator_t<Base>>;        // exposition only
    sentinel_t<Base> end_ = sentinel_t<Base>();           // exposition only
  public:
    sentinel() = default;
    constexpr explicit sentinel(sentinel_t<Base> end);
    constexpr sentinel(sentinel<!Const> s)
      requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    constexpr sentinel_t<Base> base() const;

    friend constexpr bool operator==(const CI& y, const sentinel& x);
  };
}
```

`constexpr explicit sentinel(sentinel_t<Base> end);`

1 *Effects*: Initializes `end_` with `end`.

```
constexpr sentinel(sentinel<!Const> s)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes `end_` with `std::move(s.end_)`.

`constexpr sentinel_t<Base> base() const;`

3 *Effects*: Equivalent to: `return end_;`

`friend constexpr bool operator==(const CI& y, const sentinel& x);`

4 *Effects*: Equivalent to: `return y.count() == 0 || y.base() == x.end_;`

24.7.8 Take while view [range.take.while]

24.7.8.1 Overview [range.take.while.overview]

1 Given a unary predicate `pred` and a `view` `r`, `take_while_view` produces a `view` of the range `[begin(r), ranges::find_if_not(r, pred))`.

2 The name `views::take_while` denotes a range adaptor object (24.7.2). Given subexpressions `E` and `F`, the expression `views::take_while(E, F)` is expression-equivalent to `take_while_view{E, F}`.

3 [*Example 1*:

```
auto input = istringstream{"0 1 2 3 4 5 6 7 8 9"};
auto small = [](const auto x) noexcept { return x < 5; };
auto small_ints = istream_view<int>(input) | views::take_while(small);
for (const auto i : small_ints) {
  cout << i << ' ';                              // prints 0 1 2 3 4
}
auto i = 0;
input >> i;
cout << i;                                       // prints 6
```

—*end example*]

24.7.8.2 Class template take_while_view [range.take.while.view]

```
namespace std::ranges {
  template<view V, class Pred>
    requires input_range<V> && is_object_v<Pred> &&
             indirect_unary_predicate<const Pred, iterator_t<V>>
  class take_while_view : public view_interface<take_while_view<V, Pred>> {
    // 24.7.8.3, class template take_while_view::sentinel
    template<bool> class sentinel;                    // exposition only
```

```
    V base_ = V();                                        // exposition only
    semiregular-box<Pred> pred_;                          // exposition only

  public:
    take_while_view() = default;
    constexpr take_while_view(V base, Pred pred);

    constexpr V base() const& requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr const Pred& pred() const;

    constexpr auto begin() requires (!simple-view<V>)
    { return ranges::begin(base_); }

    constexpr auto begin() const requires range<const V>
    { return ranges::begin(base_); }

    constexpr auto end() requires (!simple-view<V>)
    { return sentinel<false>(ranges::end(base_), addressof(*pred_)); }

    constexpr auto end() const requires range<const V>
    { return sentinel<true>(ranges::end(base_), addressof(*pred_)); }
  };

  template<class R, class Pred>
    take_while_view(R&&, Pred) -> take_while_view<views::all_t<R>, Pred>;
}
```

```
constexpr take_while_view(V base, Pred pred);
```

1 *Effects*: Initializes *base_* with `std::move(base)` and *pred_* with `std::move(pred)`.

```
constexpr const Pred& pred() const;
```

2 *Effects*: Equivalent to: `return *pred_;`

24.7.8.3 Class template `take_while_view::sentinel` [range.take.while.sentinel]

```
namespace std::ranges {
  template<view V, class Pred>
    requires input_range<V> && is_object_v<Pred> &&
             indirect_unary_predicate<const Pred, iterator_t<V>>
  template<bool Const>
  class take_while_view<V, Pred>::sentinel {              // exposition only
    using Base = conditional_t<Const, const V, V>;        // exposition only

    sentinel_t<Base> end_ = sentinel_t<Base>();           // exposition only
    const Pred* pred_ = nullptr;                          // exposition only
  public:
    sentinel() = default;
    constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);
    constexpr sentinel(sentinel<!Const> s)
      requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    constexpr sentinel_t<Base> base() const { return end_; }

    friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);
  };
}
```

```
constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);
```

1 *Effects*: Initializes *end_* with `end` and *pred_* with `pred`.

```
constexpr sentinel(sentinel<!Const> s)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes `end_` with `s.end_` and `pred_` with `s.pred_`.

```
friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);
```

3 *Effects*: Equivalent to: `return y.end_ == x || !invoke(*y.pred_, *x);`

24.7.9 Drop view [range.drop]

24.7.9.1 Overview [range.drop.overview]

1 `drop_view` produces a `view` excluding the first N elements from another `view`, or an empty range if the adapted `view` contains fewer than N elements.

2 The name `views::drop` denotes a range adaptor object (24.7.2). Let `E` and `F` be expressions, let `T` be `remove_cvref_t<decltype((E))>`, and let `D` be `range_difference_t<decltype((E))>`. If `decltype((F))` does not model `convertible_to<D>`, `views::drop(E, F)` is ill-formed. Otherwise, the expression `views::drop(E, F)` is expression-equivalent to:

(2.1) — If `T` is a specialization of `ranges::empty_view` (24.6.2.2), then `((void) F, decay-copy(E))`.

(2.2) — Otherwise, if `T` models `random_access_range` and `sized_range` and is

(2.2.1) — a specialization of `span` (22.7.3) where `T::extent == dynamic_extent`,

(2.2.2) — a specialization of `basic_string_view` (21.4),

(2.2.3) — a specialization of `ranges::iota_view` (24.6.4.2), or

(2.2.4) — a specialization of `ranges::subrange` (24.5.4),

then `T{ranges::begin(E) + min<D>(ranges::size(E), F), ranges::end(E)}`, except that `E` is evaluated only once.

(2.3) — Otherwise, `ranges::drop_view{E, F}`.

3 [*Example 1*:

```
auto ints = views::iota(0) | views::take(10);
auto latter_half = drop_view{ints, 5};
for (auto i : latter_half) {
  cout << i << ' ';                         // prints 5 6 7 8 9
}
```

— *end example*]

24.7.9.2 Class template `drop_view` [range.drop.view]

```
namespace std::ranges {
  template<view V>
  class drop_view : public view_interface<drop_view<V>> {
  public:
    drop_view() = default;
    constexpr drop_view(V base, range_difference_t<V> count);

    constexpr V base() const& requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin()
      requires (!(simple-view<V> && random_access_range<V>));
    constexpr auto begin() const
      requires random_access_range<const V>;

    constexpr auto end()
      requires (!simple-view<V>)
    { return ranges::end(base_); }

    constexpr auto end() const
      requires range<const V>
    { return ranges::end(base_); }
```

```
      constexpr auto size()
        requires sized_range<V>
      {
        const auto s = ranges::size(base_);
        const auto c = static_cast<decltype(s)>(count_);
        return s < c ? 0 : s - c;
      }

      constexpr auto size() const
        requires sized_range<const V>
      {
        const auto s = ranges::size(base_);
        const auto c = static_cast<decltype(s)>(count_);
        return s < c ? 0 : s - c;
      }
    private:
      V base_ = V();                              // exposition only
      range_difference_t<V> count_ = 0;           // exposition only
    };

    template<class R>
      drop_view(R&&, range_difference_t<R>) -> drop_view<views::all_t<R>>;
  }
```

```
constexpr drop_view(V base, range_difference_t<V> count);
```

1 *Preconditions*: `count >= 0` is `true`.

2 *Effects*: Initializes *`base_`* with `std::move(base)` and *`count_`* with `count`.

```
constexpr auto begin()
  requires (!(simple-view<V> && random_access_range<V>));
constexpr auto begin() const
  requires random_access_range<const V>;
```

3 *Returns*: `ranges::next(ranges::begin(base_), count_, ranges::end(base_))`.

4 *Remarks*: In order to provide the amortized constant-time complexity required by the `range` concept when `drop_view` models `forward_range`, the first overload caches the result within the `drop_view` for use on subsequent calls.

[*Note 1*: Without this, applying a `reverse_view` over a `drop_view` would have quadratic iteration complexity. — *end note*]

24.7.10 Drop while view [range.drop.while]

24.7.10.1 Overview [range.drop.while.overview]

1 Given a unary predicate `pred` and a `view` `r`, `drop_while_view` produces a `view` of the range `[ranges::find_if_not(r, pred), ranges::end(r))`.

2 The name `views::drop_while` denotes a range adaptor object (24.7.2). Given subexpressions `E` and `F`, the expression `views::drop_while(E, F)` is expression-equivalent to `drop_while_view{E, F}`.

3 [*Example 1*:

```
  constexpr auto source = "  \t   \t   \t   hello there";
  auto is_invisible = [](const auto x) { return x == ' ' || x == '\t'; };
  auto skip_ws = drop_while_view{source, is_invisible};
  for (auto c : skip_ws) {
    cout << c;                                    // prints hello there with no leading space
  }
```

— *end example*]

24.7.10.2 Class template `drop_while_view` [range.drop.while.view]

```
  namespace std::ranges {
    template<view V, class Pred>
      requires input_range<V> && is_object_v<Pred> &&
               indirect_unary_predicate<const Pred, iterator_t<V>>
```

```
    class drop_while_view : public view_interface<drop_while_view<V, Pred>> {
    public:
      drop_while_view() = default;
      constexpr drop_while_view(V base, Pred pred);

      constexpr V base() const& requires copy_constructible<V> { return base_; }
      constexpr V base() && { return std::move(base_); }

      constexpr const Pred& pred() const;

      constexpr auto begin();

      constexpr auto end()
      { return ranges::end(base_); }

    private:
      V base_ = V();                                    // exposition only
      semiregular-box<Pred> pred_;                      // exposition only
    };

    template<class R, class Pred>
      drop_while_view(R&&, Pred) -> drop_while_view<views::all_t<R>, Pred>;
  }
```

```
constexpr drop_while_view(V base, Pred pred);
```

1 *Effects*: Initializes *base_* with `std::move(base)` and *pred_* with `std::move(pred)`.

```
constexpr const Pred& pred() const;
```

2 *Effects*: Equivalent to: `return *pred_;`

```
constexpr auto begin();
```

3 *Returns*: `ranges::find_if_not(base_, cref(*pred_))`.

4 *Remarks*: In order to provide the amortized constant-time complexity required by the `range` concept when `drop_while_view` models `forward_range`, the first call caches the result within the `drop_while_view` for use on subsequent calls.

[*Note 1*: Without this, applying a `reverse_view` over a `drop_while_view` would have quadratic iteration complexity. — *end note*]

24.7.11 Join view [range.join]

24.7.11.1 Overview [range.join.overview]

1 `join_view` flattens a `view` of ranges into a `view`.

2 The name `views::join` denotes a range adaptor object (24.7.2). Given a subexpression `E`, the expression `views::join(E)` is expression-equivalent to `join_view{E}`.

3 [*Example 1*:

```
  vector<string> ss{"hello", " ", "world", "!"};
  join_view greeting{ss};
  for (char ch : greeting)
    cout << ch;                               // prints: hello world!
```

— *end example*]

24.7.11.2 Class template `join_view` [range.join.view]

```
  namespace std::ranges {
    template<input_range V>
      requires view<V> && input_range<range_reference_t<V>> &&
               (is_reference_v<range_reference_t<V>> ||
                view<range_value_t<V>>)
    class join_view : public view_interface<join_view<V>> {
    private:
      using InnerRng =                        // exposition only
```

```
      range_reference_t<V>;
    // 24.7.11.3, class template join_view::iterator
    template<bool Const>
      struct iterator;                    // exposition only

    conditional_t<Const, const join_view, join_view>;
  using Base   = conditional_t<Const, const V, V>;             // exposition only

  static constexpr bool ref-is-glvalue =                       // exposition only
    is_reference_v<range_reference_t<Base>>;

  iterator_t<Base> outer_ = iterator_t<Base>();                // exposition only
  iterator_t<range_reference_t<Base>> inner_ =                 // exposition only
    iterator_t<range_reference_t<Base>>();
  Parent* parent_ = nullptr;                                   // exposition only

  constexpr void satisfy();                                    // exposition only
public:
  using iterator_concept  = see below;
  using iterator_category = see below;
  using value_type        = range_value_t<range_reference_t<Base>>;
  using difference_type   = see below;

  iterator() = default;
  constexpr iterator(Parent& parent, iterator_t<Base> outer);
  constexpr iterator(iterator<!Const> i)
    requires Const &&
             convertible_to<iterator_t<V>, iterator_t<Base>> &&
             convertible_to<iterator_t<InnerRng>,
                            iterator_t<range_reference_t<Base>>>;

  constexpr decltype(auto) operator*() const { return *inner_; }

  constexpr iterator_t<Base> operator->() const
    requires has-arrow<iterator_t<Base>> && copyable<iterator_t<Base>>;

  constexpr iterator& operator++();
  constexpr void operator++(int);
  constexpr iterator operator++(int)
    requires ref-is-glvalue && forward_range<Base> &&
             forward_range<range_reference_t<Base>>;

  constexpr iterator& operator--()
    requires ref-is-glvalue && bidirectional_range<Base> &&
             bidirectional_range<range_reference_t<Base>> &&
             common_range<range_reference_t<Base>>;

  constexpr iterator operator--(int)
    requires ref-is-glvalue && bidirectional_range<Base> &&
             bidirectional_range<range_reference_t<Base>> &&
             common_range<range_reference_t<Base>>;

  friend constexpr bool operator==(const iterator& x, const iterator& y)
    requires ref-is-glvalue && equality_comparable<iterator_t<Base>> &&
             equality_comparable<iterator_t<range_reference_t<Base>>>;

  friend constexpr decltype(auto) iter_move(const iterator& i)
  noexcept(noexcept(ranges::iter_move(i.inner_))) {
    return ranges::iter_move(i.inner_);
  }
```

```
      friend constexpr void iter_swap(const iterator& x, const iterator& y)
        noexcept(noexcept(ranges::iter_swap(x.inner_, y.inner_)));
    };
  }
```

1 `iterator::iterator_concept` is defined as follows:

(1.1) — If *`ref-is-glvalue`* is `true` and *`Base`* and `range_reference_t<Base>` each model `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(1.2) — Otherwise, if *`ref-is-glvalue`* is `true` and *`Base`* and `range_reference_t<Base>` each model `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.

(1.3) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2 `iterator::iterator_category` is defined as follows:

(2.1) — Let *OUTERC* denote `iterator_traits<iterator_t<Base>>::iterator_category`, and let *INNERC* denote `iterator_traits<iterator_t<range_reference_t<Base>>>::iterator_category`.

(2.2) — If *`ref-is-glvalue`* is `true` and *OUTERC* and *INNERC* each model `derived_from<bidirectional_iterator_tag>`, `iterator_category` denotes `bidirectional_iterator_tag`.

(2.3) — Otherwise, if *`ref-is-glvalue`* is `true` and *OUTERC* and *INNERC* each model `derived_from<forward_iterator_tag>`, `iterator_category` denotes `forward_iterator_tag`.

(2.4) — Otherwise, if *OUTERC* and *INNERC* each model `derived_from<input_iterator_tag>`, `iterator_category` denotes `input_iterator_tag`.

(2.5) — Otherwise, `iterator_category` denotes `output_iterator_tag`.

3 `iterator::difference_type` denotes the type:

```
common_type_t<
  range_difference_t<Base>,
  range_difference_t<range_reference_t<Base>>>
```

4 `join_view` iterators use the *`satisfy`* function to skip over empty inner ranges.

```
constexpr void satisfy();         // exposition only
```

5 *Effects*: Equivalent to:

```
auto update_inner = [this](range_reference_t<Base> x) -> auto& {
  if constexpr (ref-is-glvalue) // x is a reference
    return x;
  else
    return (parent_->inner_ = views::all(std::move(x)));
};

for (; outer_ != ranges::end(parent_->base_); ++outer_) {
  auto& inner = update_inner(*outer_);
  inner_ = ranges::begin(inner);
  if (inner_ != ranges::end(inner))
    return;
}
if constexpr (ref-is-glvalue)
  inner_ = iterator_t<range_reference_t<Base>>();
```

```
constexpr iterator(Parent& parent, iterator_t<Base> outer);
```

6 *Effects*: Initializes *`outer_`* with `std::move(outer)` and *`parent_`* with `addressof(parent)`; then calls *`satisfy`*`()`.

```
constexpr iterator(iterator<!Const> i)
  requires Const &&
           convertible_to<iterator_t<V>, iterator_t<Base>> &&
           convertible_to<iterator_t<InnerRng>,
                          iterator_t<range_reference_t<Base>>>;
```

7 *Effects*: Initializes *`outer_`* with `std::move(i.`*`outer_`*`)`, *`inner_`* with `std::move(i.`*`inner_`*`)`, and *`parent_`* with `i.`*`parent_`*.

```
constexpr iterator_t<Base> operator->() const
  requires has-arrow<iterator_t<Base>> && copyable<iterator_t<Base>>;
```

8 *Effects*: Equivalent to `return inner_;`

```
constexpr iterator& operator++();
```

9 Let *inner-range* be:

(9.1) — If *ref-is-glvalue* is true, `*outer_`.

(9.2) — Otherwise, `parent_->inner_`.

10 *Effects*: Equivalent to:

```
auto&& inner_rng = inner-range;
if (++inner_ == ranges::end(inner_rng)) {
  ++outer_;
  satisfy();
}
return *this;
```

```
constexpr void operator++(int);
```

11 *Effects*: Equivalent to: `++*this`.

```
constexpr iterator operator++(int)
  requires ref-is-glvalue && forward_range<Base> &&
           forward_range<range_reference_t<Base>>;
```

12 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--()
  requires ref-is-glvalue && bidirectional_range<Base> &&
           bidirectional_range<range_reference_t<Base>> &&
           common_range<range_reference_t<Base>>;
```

13 *Effects*: Equivalent to:

```
if (outer_ == ranges::end(parent_->base_))
  inner_ = ranges::end(*--outer_);
while (inner_ == ranges::begin(*outer_))
  inner_ = ranges::end(*--outer_);
--inner_;
return *this;
```

```
constexpr iterator operator--(int)
  requires ref-is-glvalue && bidirectional_range<Base> &&
           bidirectional_range<range_reference_t<Base>> &&
           common_range<range_reference_t<Base>>;
```

14 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires ref-is-glvalue && equality_comparable<iterator_t<Base>> &&
           equality_comparable<iterator_t<range_reference_t<Base>>>;
```

15 *Effects*: Equivalent to: `return x.outer_ == y.outer_ && x.inner_ == y.inner_;`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.inner_, y.inner_)));
```

16 *Effects*: Equivalent to: `return ranges::iter_swap(x.inner_, y.inner_);`

24.7.11.4 Class template join_view::*sentinel* [range.join.sentinel]

```
namespace std::ranges {
  template<input_range V>
    requires view<V> && input_range<range_reference_t<V>> &&
             (is_reference_v<range_reference_t<V>> ||
              view<range_value_t<V>>)
  template<bool Const>
  struct join_view<V>::sentinel {
  private:
    using Parent =                                          // exposition only
      conditional_t<Const, const join_view, join_view>;
    using Base    = conditional_t<Const, const V, V>;       // exposition only
    sentinel_t<Base> end_ = sentinel_t<Base>();             // exposition only
  public:
    sentinel() = default;

    constexpr explicit sentinel(Parent& parent);
    constexpr sentinel(sentinel<!Const> s)
      requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);
  };
}
```

`constexpr explicit sentinel(Parent& parent);`

1 *Effects*: Initializes *end_* with `ranges::end(parent.base_)`.

```
constexpr sentinel(sentinel<!Const> s)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes *end_* with `std::move(s.end_)`.

`friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);`

3 *Effects*: Equivalent to: `return x.outer_ == y.end_;`

24.7.12 Split view [range.split]

24.7.12.1 Overview [range.split.overview]

1 `split_view` takes a `view` and a delimiter, and splits the `view` into subranges on the delimiter. The delimiter can be a single element or a `view` of elements.

2 The name `views::split` denotes a range adaptor object (24.7.2). Given subexpressions `E` and `F`, the expression `views::split(E, F)` is expression-equivalent to `split_view{E, F}`.

3 [*Example 1*:

```
string str{"the quick brown fox"};
split_view sentence{str, ' '};
for (auto word : sentence) {
  for (char ch : word)
    cout << ch;
  cout << '*';
}
// The above prints: the*quick*brown*fox*
```

— *end example*]

24.7.12.2 Class template split_view [range.split.view]

```
namespace std::ranges {
  template<auto> struct require-constant;       // exposition only

  template<class R>
  concept tiny-range =                          // exposition only
    sized_range<R> &&
    requires { typename require-constant<remove_reference_t<R>::size()>; } &&
    (remove_reference_t<R>::size() <= 1);
```

```
template<input_range V, forward_range Pattern>
  requires view<V> && view<Pattern> &&
           indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&

  }
};

template<class R, class P>
  split_view(R&&, P&&) -> split_view<views::all_t<R>, views::all_t<P>>;

template<input_range R>
  split_view(R&&, range_value_t<R>)
    -> split_view<views::all_t<R>, single_view<range_value_t<R>>>;
}
```

```
constexpr split_view(V base, Pattern pattern);
```

1 *Effects*: Initializes *base_* with `std::move(base)`, and *pattern_* with `std::move(pattern)`.

```
template<input_range R>
  requires constructible_from<V, views::all_t<R>> &&
           constructible_from<Pattern, single_view<range_value_t<R>>>
```

```
constexpr split_view(R&& r, range_value_t<R> e);
```

2 *Effects*: Initializes `base_` with `views::all(std::forward<R>(r))`, and `pattern_` with `single_view{ std::move(e)}`.

24.7.12.3 Class template `split_view::outer-iterator` [range.split.outer]

```
namespace std::ranges {
  template<input_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
             indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
             (forward_range<V> || tiny-range<Pattern>)
  template<bool Const>
  struct split_view<V, Pattern>::outer-iterator {
  private:
    using Parent =                          // exposition only
      conditional_t<Const, const split_view, split_view>;
    using Base   =                          // exposition only
      conditional_t<Const, const V, V>;
    Parent* parent_ = nullptr;              // exposition only
    iterator_t<Base> current_ =             // exposition only, present only if V models forward_range
      iterator_t<Base>();

  public:
    using iterator_concept  =
      conditional_t<forward_range<Base>, forward_iterator_tag, input_iterator_tag>;
    using iterator_category = input_iterator_tag;
    // 24.7.12.4, class split_view::outer-iterator::value_type
    struct value_type;
    using difference_type   = range_difference_t<Base>;

    outer-iterator() = default;
    constexpr explicit outer-iterator(Parent& parent)
      requires (!forward_range<Base>);
    constexpr outer-iterator(Parent& parent, iterator_t<Base> current)
      requires forward_range<Base>;
    constexpr outer-iterator(outer-iterator<!Const> i)
      requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

    constexpr value_type operator*() const;

    constexpr outer-iterator& operator++();
    constexpr decltype(auto) operator++(int) {
      if constexpr (forward_range<Base>) {
        auto tmp = *this;
        ++*this;
        return tmp;
      } else
        ++*this;
    }

      requires forward_range<Base>;

    friend constexpr bool operator==(const outer-iterator& x, default_sentinel_t);
  };
}
```

1 Many of the following specifications refer to the notional member *current* of `outer-iterator`. *current* is equivalent to `current_` if `V` models `forward_range`, and `parent_->current_` otherwise.

```
constexpr explicit outer-iterator(Parent& parent)
  requires (!forward_range<Base>);
```

2 *Effects*: Initializes `parent_` with `addressof(parent)`.

```
constexpr outer-iterator(Parent& parent, iterator_t<Base> current)
  requires forward_range<Base>;
```

3 *Effects*: Initializes *parent_* with `addressof(parent)` and *current_* with `std::move(current)`.

```
constexpr outer-iterator(outer-iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

4 *Effects*: Initializes *parent_* with `i.parent_` and *current_* with `std::move(i.current_)`.

```
constexpr value_type operator*() const;
```

5 *Effects*: Equivalent to: `return value_type{*this};`

```
constexpr outer-iterator& operator++();
```

6 *Effects*: Equivalent to:

```
const auto end = ranges::end(parent_->base_);
if (current == end) return *this;
const auto [pbegin, pend] = subrange{parent_->pattern_};
if (pbegin == pend) ++current;
else {
  do {
    auto [b, p] = ranges::mismatch(std::move(current), end, pbegin, pend);
    current = std::move(b);
    if (p == pend) {
      break;              // The pattern matched; skip it
    }
  } while (++current != end);
}
return *this;
```

```
friend constexpr bool operator==(const outer-iterator& x, const outer-iterator& y)
  requires forward_range<Base>;
```

7 *Effects*: Equivalent to: `return x.current_ == y.current_;`

```
friend constexpr bool operator==(const outer-iterator& x, default_sentinel_t);
```

8 *Effects*: Equivalent to: `return x.current == ranges::end(x.parent_->base_);`

24.7.12.4 Class `split_view::outer-iterator::value_type` [range.split.outer.value]

```
namespace std::ranges {
  template<input_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
             indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
             (forward_range<V> || tiny-range<Pattern>)
  template<bool Const>
  struct split_view<V, Pattern>::outer-iterator<Const>::value_type
    : view_interface<value_type> {
  private:
    outer-iterator i_ = outer-iterator();               // exposition only
  public:
    value_type() = default;
    constexpr explicit value_type(outer-iterator i);

    constexpr inner-iterator<Const> begin() const requires copyable<outer-iterator>;
    constexpr inner-iterator<Const> begin() requires (!copyable<outer-iterator>);
    constexpr default_sentinel_t end() const;
  };
}
```

```
constexpr explicit value_type(outer-iterator i);
```

1 *Effects*: Initializes *i_* with `std::move(i)`.

```
constexpr inner-iterator<Const> begin() const requires copyable<outer-iterator>;
```

2 *Effects*: Equivalent to: `return inner-iterator<Const>{i_};`

```
constexpr inner-iterator<Const> begin() requires (!copyable<outer-iterator>);
```

3 *Effects*: Equivalent to: `return inner-iterator<Const>{std::move(i_)};`

```
constexpr default_sentinel_t end() const;
```

4 *Effects*: Equivalent to: `return default_sentinel;`

24.7.12.5 Class template split_view::*inner-iterator* [range.split.inner]

```
namespace std::ranges {
  template<input_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
             indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
             (forward_range<V> || tiny-range<Pattern>)
  template<bool Const>
  struct split_view<V, Pattern>::inner-iterator {
  private:
    using Base = conditional_t<Const, const V, V>;      // exposition only
    outer-iterator<Const> i_ = outer-iterator<Const>(); // exposition only
    bool incremented_ = false;                          // exposition only
  public:
    using iterator_concept  = typename outer-iterator<Const>::iterator_concept;
    using iterator_category = see below;
    using value_type        = range_value_t<Base>;
    using difference_type   = range_difference_t<Base>;

    inner-iterator() = default;
    constexpr explicit inner-iterator(outer-iterator<Const> i);

    constexpr decltype(auto) operator*() const { return *i_.current; }

    constexpr inner-iterator& operator++();
    constexpr decltype(auto) operator++(int) {
      if constexpr (forward_range<V>) {
        auto tmp = *this;
        ++*this;
        return tmp;
      } else
        ++*this;
    }

    friend constexpr bool operator==(const inner-iterator& x, const inner-iterator& y)
      requires forward_range<Base>;

    friend constexpr bool operator==(const inner-iterator& x, default_sentinel_t);

    friend constexpr decltype(auto) iter_move(const inner-iterator& i)
    noexcept(noexcept(ranges::iter_move(i.i_.current))) {
      return ranges::iter_move(i.i_.current);
    }

    friend constexpr void iter_swap(const inner-iterator& x, const inner-iterator& y)
      noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
      requires indirectly_swappable<iterator_t<Base>>;
  };
}
```

1 The *typedef-name* `iterator_category` denotes:

(1.1) — `forward_iterator_tag` if `iterator_traits<iterator_t<Base>>::iterator_category` models `derived_from<forward_iterator_tag>`;

(1.2) — otherwise, `iterator_traits<iterator_t<Base>>::iterator_category`.

```
constexpr explicit inner-iterator(outer-iterator<Const> i);
```

2 *Effects*: Initializes *i_* with `std::move(i)`.

```
constexpr inner-iterator& operator++();
```

3 *Effects*: Equivalent to:

```
incremented_ = true;
if constexpr (!forward_range<Base>) {
  if constexpr (Pattern::size() == 0) {
    return *this;
  }
}
++i_.current;
return *this;
```

```
friend constexpr bool operator==(const inner-iterator& x, const inner-iterator& y)
  requires forward_range<Base>;
```

4 *Effects*: Equivalent to: `return x.i_.current == y.i_.current;`

```
friend constexpr bool operator==(const inner-iterator& x, default_sentinel_t);
```

5 *Effects*: Equivalent to:

```
auto [pcur, pend] = subrange{x.i_.parent_->pattern_};
auto end = ranges::end(x.i_.parent_->base_);
if constexpr (tiny-range<Pattern>) {
  const auto & cur = x.i_.current;
  if (cur == end) return true;
  if (pcur == pend) return x.incremented_;
  return *cur == *pcur;
} else {
  auto cur = x.i_.current;
  if (cur == end) return true;
  if (pcur == pend) return x.incremented_;
  do {
    if (*cur != *pcur) return false;
    if (++pcur == pend) return true;
  } while (++cur != end);
  return false;
}
```

```
friend constexpr void iter_swap(const inner-iterator& x, const inner-iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
  requires indirectly_swappable<iterator_t<Base>>;
```

6 *Effects*: Equivalent to `ranges::iter_swap(x.i_.current, y.i_.current)`.

24.7.13 Counted view [range.counted]

1 A counted view presents a `view` of the elements of the counted range (23.3.1) `i` + `[0, n)` for an iterator `i` and non-negative integer `n`.

2 The name `views::counted` denotes a customization point object (16.3.3.3.6). Let `E` and `F` be expressions, let `T` be `decay_t<decltype((E))>`, and let `D` be `iter_difference_t<T>`. If `decltype((F))` does not model `convertible_to<D>`, `views::counted(E, F)` is ill-formed.

[*Note 1*: This case can result in substitution failure when `views::counted(E, F)` appears in the immediate context of a template instantiation. — *end note*]

Otherwise, `views::counted(E, F)` is expression-equivalent to:

(2.1) — If `T` models `contiguous_iterator`, then `span{to_address(E), static_cast<D>(F)}`.

(2.2) — Otherwise, if `T` models `random_access_iterator`, then `subrange{E, E + static_cast<D>(F)}`, except that `E` is evaluated only once.

(2.3) — Otherwise, `subrange{counted_iterator{E, F}, default_sentinel}`.

24.7.14 Common view [range.common]

24.7.14.1 Overview [range.common.overview]

1 `common_view` takes a `view` which has different types for its iterator and sentinel and turns it into a `view` of the same elements with an iterator and sentinel of the same type.

2 [*Note 1*: `common_view` is useful for calling legacy algorithms that expect a range's iterator and sentinel types to be the same. — *end note*]

3 The name `views::common` denotes a range adaptor object (24.7.2). Given a subexpression `E`, the expression `views::common(E)` is expression-equivalent to:

(3.1) — `views::all(E)`, if `decltype((E))` models `common_range` and `views::all(E)` is a well-formed expression.

(3.2) — Otherwise, `common_view{E}`.

4 [*Example 1*:

```
// Legacy algorithm:
template<class ForwardIterator>
size_t count(ForwardIterator first, ForwardIterator last);

template<forward_range R>
void my_algo(R&& r) {
  auto&& common = common_view{r};
  auto cnt = count(common.begin(), common.end());
  // ...
}
```

— *end example*]

24.7.14.2 Class template common_view [range.common.view]

```
namespace std::ranges {
  template<view V>
    requires (!common_range<V> && copyable<iterator_t<V>>)
  class common_view : public view_interface<common_view<V>> {
  private:
    V base_ = V();  // exposition only
  public:
    common_view() = default;

    constexpr explicit common_view(V r);

    template<viewable_range R>
      requires (!common_range<R> && constructible_from<V, views::all_t<R>>)
    constexpr explicit common_view(R&& r);

    constexpr V base() const& requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin() {
      if constexpr (random_access_range<V> && sized_range<V>)
        return ranges::begin(base_);
      else
        return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::begin(base_));
    }

    constexpr auto begin() const requires range<const V> {
      if constexpr (random_access_range<const V> && sized_range<const V>)
        return ranges::begin(base_);
      else
        return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::begin(base_));
    }

    constexpr auto end() {
      if constexpr (random_access_range<V> && sized_range<V>)
        return ranges::begin(base_) + ranges::size(base_);
```

```
      else
        return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::end(base_));
    }

    constexpr auto end() const requires range<const V> {
      if constexpr (random_access_range<const V> && sized_range<const V>)
        return ranges::begin(base_) + ranges::size(base_);
      else
        return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::end(base_));
    }

    constexpr auto size() requires sized_range<V> {
      return ranges::size(base_);
    }
    constexpr auto size() const requires sized_range<const V> {
      return ranges::size(base_);
    }
  };

  template<class R>
    common_view(R&&) -> common_view<views::all_t<R>>;
}
```

```
constexpr explicit common_view(V base);
```

1 *Effects*: Initializes `base_` with `std::move(base)`.

```
template<viewable_range R>
  requires (!common_range<R> && constructible_from<V, views::all_t<R>>)
constexpr explicit common_view(R&& r);
```

2 *Effects*: Initializes `base_` with `views::all(std::forward<R>(r))`.

24.7.15 Reverse view [range.reverse]

24.7.15.1 Overview [range.reverse.overview]

1 `reverse_view` takes a bidirectional `view` and produces another `view` that iterates the same elements in reverse order.

2 The name `views::reverse` denotes a range adaptor object (24.7.2). Given a subexpression `E`, the expression `views::reverse(E)` is expression-equivalent to:

(2.1) — If the type of `E` is a (possibly cv-qualified) specialization of `reverse_view`, equivalent to `E.base()`.

(2.2) — Otherwise, if the type of `E` is *cv* `subrange<reverse_iterator<I>, reverse_iterator<I>, K>` for some iterator type `I` and value `K` of type `subrange_kind`,

(2.2.1) — if `K` is `subrange_kind::sized`, equivalent to:

```
subrange<I, I, K>(E.end().base(), E.begin().base(), E.size())
```

(2.2.2) — otherwise, equivalent to:

```
subrange<I, I, K>(E.end().base(), E.begin().base())
```

However, in either case `E` is evaluated only once.

(2.3) — Otherwise, equivalent to `reverse_view{E}`.

3 [*Example 1*:

```
vector<int> is {0,1,2,3,4};
reverse_view rv {is};
for (int i : rv)
  cout << i << ' '; // prints: 4 3 2 1 0
```

— *end example*]

24.7.15.2 Class template `reverse_view` [range.reverse.view]

```
namespace std::ranges {
  template<view V>
    requires bidirectional_range<V>
```

```
  class reverse_view : public view_interface<reverse_view<V>> {
  private:
    V base_ = V();   // exposition only
  public:
    reverse_view() = default;

    constexpr explicit reverse_view(V r);

    constexpr V base() const& requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr reverse_iterator<iterator_t<V>> begin();
    constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
    constexpr auto begin() const requires common_range<const V>;

    constexpr reverse_iterator<iterator_t<V>> end();
    constexpr auto end() const requires common_range<const V>;

    constexpr auto size() requires sized_range<V> {
      return ranges::size(base_);
    }
    constexpr auto size() const requires sized_range<const V> {
      return ranges::size(base_);
    }
  };

  template<class R>
    reverse_view(R&&) -> reverse_view<views::all_t<R>>;
}
```

```
constexpr explicit reverse_view(V base);
```

1 *Effects*: Initializes *base_* with `std::move(base)`.

```
constexpr reverse_iterator<iterator_t<V>> begin();
```

2 *Returns*:

```
make_reverse_iterator(ranges::next(ranges::begin(base_), ranges::end(base_)))
```

3 *Remarks*: In order to provide the amortized constant time complexity required by the `range` concept, this function caches the result within the `reverse_view` for use on subsequent calls.

```
constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
constexpr auto begin() const requires common_range<const V>;
```

4 *Effects*: Equivalent to: `return make_reverse_iterator(ranges::end(base_));`

```
constexpr reverse_iterator<iterator_t<V>> end();
constexpr auto end() const requires common_range<const V>;
```

5 *Effects*: Equivalent to: `return make_reverse_iterator(ranges::begin(base_));`

24.7.16 Elements view [range.elements]

24.7.16.1 Overview [range.elements.overview]

1 `elements_view` takes a `view` of tuple-like values and a `size_t`, and produces a `view` with a value-type of the N^{th} element of the adapted `view`'s value-type.

2 The name `views::elements<N>` denotes a range adaptor object (24.7.2). Given a subexpression `E` and constant expression `N`, the expression `views::elements<N>(E)` is expression-equivalent to `elements_view<views::all_t<decltype((E))>, N>{E}`.

[*Example 1*:

```
auto historical_figures = map{
  {"Lovelace"sv, 1815},
  {"Turing"sv, 1912},
  {"Babbage"sv, 1791},
```

```
    {"Hamilton"sv, 1936}
  };

  auto names = historical_figures | views::elements<0>;
  for (auto&& name : names) {
    cout << name << ' ';          // prints Babbage Hamilton Lovelace Turing
  }

  auto birth_years = historical_figures | views::elements<1>;
  for (auto&& born : birth_years) {
    cout << born << ' ';          // prints 1791 1936 1815 1912
  }
```

— *end example*]

3 `keys_view` is an alias for `elements_view<views::all_t<R>, 0>`, and is useful for extracting keys from associative containers.

[*Example 2*:

```
  auto names = keys_view{historical_figures};
  for (auto&& name : names) {
    cout << name << ' ';          // prints Babbage Hamilton Lovelace Turing
  }
```

— *end example*]

4 `values_view` is an alias for `elements_view<views::all_t<R>, 1>`, and is useful for extracting values from associative containers.

[*Example 3*:

```
  auto is_even = [](const auto x) { return x % 2 == 0; };
  cout << ranges::count_if(values_view{historical_figures}, is_even);     // prints 2
```

— *end example*]

24.7.16.2 Class template `elements_view` [range.elements.view]

```
namespace std::ranges {
  template<class T, size_t N>
  concept has-tuple-element =                    // exposition only
    requires(T t) {
      typename tuple_size<T>::type;
      requires N < tuple_size_v<T>;
      typename tuple_element_t<N, T>;
      { get<N>(t) } -> convertible_to<const tuple_element_t<N, T>&>;
    };

  template<input_range V, size_t N>
    requires view<V> && has-tuple-element<range_value_t<V>, N> &&
             has-tuple-element<remove_reference_t<range_reference_t<V>>, N>
  class elements_view : public view_interface<elements_view<V, N>> {
  public:
    elements_view() = default;
    constexpr explicit elements_view(V base);

    constexpr V base() const& requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin() requires (!simple-view<V>)
    { return iterator<false>(ranges::begin(base_)); }

    constexpr auto begin() const requires simple-view<V>
    { return iterator<true>(ranges::begin(base_)); }

    constexpr auto end()
    { return sentinel<false>{ranges::end(base_)}; }
```

```
    constexpr auto end() requires common_range<V>
    { return iterator<false>{ranges::end(base_)}; }

    constexpr auto end() const requires range<const V>
    { return sentinel<true>{ranges::end(base_)}; }

    constexpr auto end() const requires common_range<const V>
    { return iterator<true>{ranges::end(base_)}; }

    constexpr auto size() requires sized_range<V>
    { return ranges::size(base_); }

    constexpr auto size() const requires sized_range<const V>
    { return ranges::size(base_); }

  private:
    // 24.7.16.3, class template elements_view::iterator
    template<bool> struct iterator;                       // exposition only
    // 24.7.16.4, class template elements_view::sentinel
    template<bool> struct sentinel;                       // exposition only
    V base_ = V();                                        // exposition only
  };
}
```

```
constexpr explicit elements_view(V base);
```

1 *Effects*: Initializes `base_` with `std::move(base)`.

```
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

13 *Effects*: Equivalent to: `return x.current_ < y.current_;`

```
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

14 *Effects*: Equivalent to: `return y < x;`

```
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

15 *Effects*: Equivalent to: `return !(y < x);`

```
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

16 *Effects*: Equivalent to: `return !(x < y);`

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;
```

17 *Effects*: Equivalent to: `return x.current_ <=> y.current_;`

```
friend constexpr iterator operator+(const iterator& x, difference_type y)
  requires random_access_range<Base>;
```

18 *Effects*: Equivalent to: `return iterator{x} += y;`

```
friend constexpr iterator operator+(difference_type x, const iterator& y)
  requires random_access_range<Base>;
```

19 *Effects*: Equivalent to: `return y + x;`

```
friend constexpr iterator operator-(const iterator& x, difference_type y)
  requires random_access_range<Base>;
```

20 *Effects*: Equivalent to: `return iterator{x} -= y;`

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

21 *Effects*: Equivalent to: `return x.current_ - y.current_;`

24.7.16.4 Class template `elements_view::sentinel` [range.elements.sentinel]

```
namespace std::ranges {
  template<input_range V, size_t N>
    requires view<V> && has-tuple-element<range_value_t<V>, N> &&
             has-tuple-element<remove_reference_t<range_reference_t<V>>, N>
  template<bool Const>
  class elements_view<V, N>::sentinel {                   // exposition only
  private:
    using Base = conditional_t<Const, const V, V>;       // exposition only
    sentinel_t<Base> end_ = sentinel_t<Base>();          // exposition only
  public:
    sentinel() = default;
    constexpr explicit sentinel(sentinel_t<Base> end);
    constexpr sentinel(sentinel<!Const> other)
      requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    constexpr sentinel_t<Base> base() const;

    friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);

    friend constexpr range_difference_t<Base>
      operator-(const iterator<Const>& x, const sentinel& y)
        requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;

    friend constexpr range_difference_t<Base>
      operator-(const sentinel& x, const iterator<Const>& y)
        requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
  };
}
```

```
constexpr explicit sentinel(sentinel_t<Base> end);
```

1 *Effects*: Initializes `end_` with `end`.

```
constexpr sentinel(sentinel<!Const> other)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes `end_` with `std::move(other.end_)`.

```
constexpr sentinel_t<Base> base() const;
```

3 *Effects*: Equivalent to: `return end_;`

```
friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);
```

4 *Effects*: Equivalent to: `return x.current_ == y.end_;`

```
friend constexpr range_difference_t<Base>
  operator-(const iterator<Const>& x, const sentinel& y)
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

5 *Effects*: Equivalent to: `return x.current_ - y.end_;`

```
friend constexpr range_difference_t<Base>
  operator-(const sentinel& x, const iterator<Const>& y)
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

6 *Effects*: Equivalent to: `return x.end_ - y.current_;`

25 Algorithms library [algorithms]

25.1 General [algorithms.general]

1 This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 22) and other sequences.

2 The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 91.

Table 91: Algorithms library summary [tab:algorithms.summary]

	Subclause	Header
25.2	Algorithms requirements	
25.3	Parallel algorithms	
25.5	Algorithm result types	<algorithm>
25.6	Non-modifying sequence operations	
25.7	Mutating sequence operations	
25.8	Sorting and related operations	
25.10	Generalized numeric operations	<numeric>
25.11	Specialized <memory> algorithms	<memory>
25.12	C library algorithms	<cstdlib>

25.2 Algorithms requirements [algorithms.requirements]

1 All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.

2 The entities defined in the std::ranges namespace in this Clause are not found by argument-dependent name lookup (6.5.3). When found by unqualified (6.5.2) name lookup for the *postfix-expression* in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

[*Example 1*:

```
void foo() {
  using namespace std::ranges;
  std::vector<int> vec{1,2,3};
  find(begin(vec), end(vec), 2);        // #1
}
```

The function call expression at #1 invokes std::ranges::find, not std::find, despite that (a) the iterator type returned from begin(vec) and end(vec) may be associated with namespace std and (b) std::find is more specialized (13.7.7.3) than std::ranges::find since the former requires its first two parameters to have the same type. — *end example*]

3 For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.

4 Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.

(4.1) — If an algorithm's template parameter is named InputIterator, InputIterator1, or InputIterator2, the template argument shall meet the *Cpp17InputIterator* requirements (23.3.5.3).

(4.2) — If an algorithm's template parameter is named OutputIterator, OutputIterator1, or OutputIterator2, the template argument shall meet the *Cpp17OutputIterator* requirements (23.3.5.4).

(4.3) — If an algorithm's template parameter is named ForwardIterator, ForwardIterator1, or ForwardIterator2, the template argument shall meet the *Cpp17ForwardIterator* requirements (23.3.5.5).

(4.4) — If an algorithm's template parameter is named NoThrowForwardIterator, the template argument shall meet the *Cpp17ForwardIterator* requirements (23.3.5.5), and is required to have the property that no exceptions are thrown from increment, assignment, or comparison of, or indirection through, valid iterators.

(4.5) — If an algorithm's template parameter is named `BidirectionalIterator`, `BidirectionalIterator1`, or `BidirectionalIterator2`, the template argument shall meet the *Cpp17BidirectionalIterator* requirements (23.3.5.6).

(4.6) — If an algorithm's template parameter is named `RandomAccessIterator`, `RandomAccessIterator1`, or `RandomAccessIterator2`, the template argument shall meet the *Cpp17RandomAccessIterator* requirements (23.3.5.7).

5 If an algorithm's *Effects*: element specifies that a value pointed to by any iterator passed as an argument is modified, then that algorithm has an additional type requirement: The type of that argument shall meet the requirements of a mutable iterator (23.3).

[*Note 1*: This requirement does not affect arguments that are named `OutputIterator`, `OutputIterator1`, or `OutputIterator2`, because output iterators must always be mutable, nor does it affect arguments that are constrained, for which mutability requirements are expressed explicitly. — *end note*]

6 Both in-place and copying versions are provided for certain algorithms.[236] When such a version is provided for *algorithm* it is called *algorithm*`_copy`. Algorithms that take predicates end with the suffix `_if` (which follows the suffix `_copy`).

7 When not otherwise constrained, the `Predicate` parameter is used whenever an algorithm expects a function object (20.14) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as `true`. In other words, if an algorithm takes `Predicate pred` as its argument and `first` as its iterator argument with value type `T`, it should work correctly in the construct `pred(*first)` contextually converted to `bool` (7.3). The function object `pred` shall not apply any non-constant function through the dereferenced iterator. Given a glvalue `u` of type (possibly `const`) `T` that designates the same object as `*first`, `pred(u)` shall be a valid expression that is equal to `pred(*first)`.

8 When not otherwise constrained, the `BinaryPredicate` parameter is used whenever an algorithm expects a function object that when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type `T` when `T` is part of the signature returns a value testable as `true`. In other words, if an algorithm takes `BinaryPredicate binary_pred` as its argument and `first1` and `first2` as its iterator arguments with respective value types `T1` and `T2`, it should work correctly in the construct `binary_pred(*first1, *first2)` contextually converted to `bool` (7.3). Unless otherwise specified, `BinaryPredicate` always takes the first iterator's `value_type` as its first argument, that is, in those cases when `T value` is part of the signature, it should work correctly in the construct `binary_pred(*first1, value)` contextually converted to `bool` (7.3). `binary_pred` shall not apply any non-constant function through the dereferenced iterators. Given a glvalue `u` of type (possibly `const`) `T1` that designates the same object as `*first1`, and a glvalue `v` of type (possibly `const`) `T2` that designates the same object as `*first2`, `binary_pred(u, *first2)`, `binary_pred(*first1, v)`, and `binary_pred(u, v)` shall each be a valid expression that is equal to `binary_pred(*first1, *first2)`, and `binary_pred(u, value)` shall be a valid expression that is equal to `binary_pred(*first1, value)`.

9 The parameters `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, and `BinaryOperation2` are used whenever an algorithm expects a function object (20.14).

10 [*Note 2*: Unless otherwise specified, algorithms that take function objects as arguments can copy those function objects freely. If object identity is important, a wrapper class that points to a noncopied implementation object such as `reference_wrapper<T>` (20.14.6), or some equivalent solution, can be used. — *end note*]

11 When the description of an algorithm gives an expression such as `*first == value` for a condition, the expression shall evaluate to either `true` or `false` in boolean contexts.

12 In the description of the algorithms, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as those of

```
auto tmp = a;
for (; n < 0; ++n) --tmp;
for (; n > 0; --n) ++tmp;
return tmp;
```

236) The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, `sort_copy` is not included because the cost of sorting is much more significant, and users might as well do `copy` followed by `sort`.

Similarly, operator `-` is used for some combinations of iterators and sentinel types for which it does not have to be defined. If `[a, b)` denotes a range, the semantics of `b - a` in these cases are the same as those of

```
iter_difference_t<decltype(a)> n = 0;
for (auto tmp = a; tmp != b; ++tmp) ++n;
return n;
```

and if `[b, a)` denotes a range, the same as those of

```
iter_difference_t<decltype(b)> n = 0;
for (auto tmp = b; tmp != a; ++tmp) --n;
return n;
```

13 In the description of algorithm return values, a sentinel value `s` denoting the end of a range `[i, s)` is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using `ranges::next(i, s)`.

14 Overloads of algorithms that take `range` arguments (24.4.2) behave as if they are implemented by calling `ranges::begin` and `ranges::end` on the `range`(s) and dispatching to the overload in namespace `ranges` that takes separate iterator and sentinel arguments.

15 The number and order of deducible template parameters for algorithm declarations are unspecified, except where explicitly stated otherwise.

[*Note 3*: Consequently, an implementation can reject calls that specify an explicit template argument list. — *end note*]

25.3 Parallel algorithms [algorithms.parallel]

25.3.1 Preamble [algorithms.parallel.defns]

1 Subclause 25.3 describes components that C++ programs may use to perform operations on containers and other sequences in parallel.

2 A *parallel algorithm* is a function template listed in this document with a template parameter named `ExecutionPolicy`.

3 Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:

(3.1) — All operations of the categories of the iterators that the algorithm is instantiated with.

(3.2) — Operations on those sequence elements that are required by its specification.

(3.3) — User-provided function objects to be applied during the execution of the algorithm, if required by the specification.

(3.4) — Operations on those function objects required by the specification.

[*Note 1*: See 25.2. — *end note*]

These functions are herein called *element access functions*.

[*Example 1*: The `sort` function may invoke the following element access functions:

(3.5) — Operations of the random-access iterator of the actual template argument (as per 23.3.5.7), as implied by the name of the template parameter `RandomAccessIterator`.

(3.6) — The `swap` function on the elements of the sequence (as per the preconditions specified in 25.8.2.1).

(3.7) — The user-provided `Compare` function object.

— *end example*]

4 A standard library function is *vectorization-unsafe* if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function.

[*Note 2*: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees. — *end note*]

[*Example 2*:

```
int x = 0;
std::mutex m;
void f() {
  int a[] = {1,2};
```

```
  std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [&](int) {
    std::lock_guard<mutex> guard(m);            // incorrect: lock_guard constructor calls m.lock()
  ++x;
  });
}
```

The above program may result in two consecutive calls to `m.lock()` on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution. — *end example*]

25.3.2 Requirements on user-provided function objects [algorithms.parallel.user]

1 Unless otherwise specified, function objects passed into parallel algorithms as objects of type `Predicate`, `BinaryPredicate`, `Compare`, `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, `BinaryOperation2`, and the operators used by the analogous overloads to these parallel algorithms that are formed by an invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

25.3.3 Effect of execution policies on algorithm execution [algorithms.parallel.exec]

1 Parallel algorithms have template parameters named `ExecutionPolicy` (20.18) which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.

2 If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object.

[*Note 1*: For example, `swap`, `++`, `--`, `@=`, and assignments modify the object. For the assignment and `@=` operators, only the left argument is modified. — *end note*]

3 Unless otherwise stated, implementations may make arbitrary copies of elements (with type `T`) from sequences where `is_trivially_copy_constructible_v<T>` and `is_trivially_destructible_v<T>` are `true`.

[*Note 2*: This implies that user-supplied function objects cannot rely on object identity of arguments for such input sequences. If object identity of the arguments to these function objects is important, a wrapping iterator that returns a non-copied implementation object such as `reference_wrapper<T>` (20.14.6), or some equivalent solution, can be used. — *end note*]

4 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::sequenced_policy` all occur in the calling thread of execution.

[*Note 3*: The invocations are not interleaved; see 6.9.1. — *end note*]

5 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::unsequenced_policy` are permitted to execute in an unordered fashion in the calling thread of execution, unsequenced with respect to one another in the calling thread of execution.

[*Note 4*: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — *end note*]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a `execution::unsequenced_policy` algorithm.

[*Note 5*: Because `execution::unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — *end note*]

6 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_policy` are permitted to execute either in the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by `thread` (32.4.3) or `jthread` (32.4.4) provide concurrent forward progress guarantees (6.9.2.3), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other.

[*Note 6*: It is the caller's responsibility to ensure that the invocation does not introduce data races or deadlocks. — *end note*]

[*Example 1*:

```
int a[] = {0,1};
```

```
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
  v.push_back(i*2+1);                              // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container `v`. — *end example*]

[*Example 2*:

```
std::atomic<int> x{0};
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
  x.fetch_add(1, std::memory_order::relaxed);
  // spin wait for another iteration to change the value of x
  while (x.load(std::memory_order::relaxed) == 1) { }          // incorrect: assumes execution order
});
```

The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution. — *end example*]

[*Example 3*:

```
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
  std::lock_guard<mutex> guard(m);
  ++x;
});
```

The above example synchronizes access to object `x` ensuring that it is incremented correctly. — *end example*]

7 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_unsequenced_policy` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees.

[*Note 7*: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — *end note*]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a `execution::parallel_unsequenced_policy` algorithm.

[*Note 8*: Because `execution::parallel_unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — *end note*]

8 [*Note 9*: The semantics of invocation with `execution::unsequenced_policy`, `execution::parallel_policy`, or `execution::parallel_unsequenced_policy` allow the implementation to fall back to sequential execution if the system cannot parallelize an algorithm invocation, e.g., due to lack of resources. — *end note*]

9 If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either

(9.1) — temporarily block with forward progress guarantee delegation (6.9.2.3) on the completion of these library-managed threads of execution, or

(9.2) — eventually execute an element access function;

the thread of execution will continue to do so until the algorithm is finished.

[*Note 10*: In blocking with forward progress guarantee delegation in this context, a thread of execution created by the library is considered to have finished execution as soon as it has finished the execution of the particular element access function that the invoking thread of execution logically depends on. — *end note*]

10 The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.

25.3.4 Parallel algorithm exceptions [algorithms.parallel.exceptions]

1 During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a `bad_alloc` exception.

2 During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the `ExecutionPolicy`.

25.3.5 `ExecutionPolicy` algorithm overloads [algorithms.parallel.overloads]

1 Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named `ExecutionPolicy`, which is the first template parameter. Additionally, each parallel algorithm overload has an additional function parameter of type `ExecutionPolicy&&`, which is the first function parameter.

[*Note 1*: Not all algorithms have parallel algorithm overloads. — *end note*]

2 Unless otherwise specified, the semantics of `ExecutionPolicy` algorithm overloads are identical to their overloads without.

3 Unless otherwise specified, the complexity requirements of `ExecutionPolicy` algorithm overloads are relaxed from the complexity requirements of the overloads without as follows: when the guarantee says "at most *expr*" or "exactly *expr*" and does not specify the number of assignments or swaps, and *expr* is not already expressed with $\mathcal{O}()$ notation, the complexity of the algorithm shall be $\mathcal{O}(expr)$.

4 Parallel algorithms shall not participate in overload resolution unless `is_execution_policy_v<remove_cvref_t<ExecutionPolicy>>` is `true`.

25.4 Header `<algorithm>` synopsis [algorithm.syn]

```

```
    }
  };
}
```

25.6 Non-modifying sequence operations [alg.nonmodifying]

25.6.1 All of [alg.all.of]

```
template<class InputIterator, class Predicate>
  constexpr bool all_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool all_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
              Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::all_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::all_of(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: `false` if E is `false` for some iterator `i` in the range `[first, last)`, and `true` otherwise.

3 *Complexity*: At most `last - first` applications of the predicate and any projection.

25.6.2 Any of [alg.any.of]

```
template<class InputIterator, class Predicate>
  constexpr bool any_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool any_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
              Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::any_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::any_of(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: `true` if E is `true` for some iterator `i` in the range `[first, last)`, and `false` otherwise.

3 *Complexity*: At most `last - first` applications of the predicate and any projection.

25.6.3 None of [alg.none.of]

```
template<class InputIterator, class Predicate>
  constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool none_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
               Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::none_of(I first, S last, Pred pred, Proj proj = {});
```

```
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::none_of(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: `false` if E is `true` for some iterator `i` in the range `[first, last)`, and `true` otherwise.

3 *Complexity*: At most `last - first` applications of the predicate and any projection.

25.6.4 For each [alg.foreach]

```
template<class InputIterator, class Function>
  constexpr Function for_each(InputIterator first, InputIterator last, Function f);
```

1 *Preconditions*: `Function` meets the *Cpp17MoveConstructible* requirements (Table 28).

[*Note 1*: `Function` need not meet the requirements of *Cpp17CopyConstructible* (Table 29). — *end note*]

2 *Effects*: Applies `f` to the result of dereferencing every iterator in the range `[first, last)`, starting from `first` and proceeding to `last - 1`.

[*Note 2*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

3 *Returns*: `f`.

4 *Complexity*: Applies `f` exactly `last - first` times.

5 *Remarks*: If `f` returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Function>
  void for_each(ExecutionPolicy&& exec,
                ForwardIterator first, ForwardIterator last,
                Function f);
```

6 *Preconditions*: `Function` meets the *Cpp17CopyConstructible* requirements.

7 *Effects*: Applies `f` to the result of dereferencing every iterator in the range `[first, last)`.

[*Note 3*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

8 *Complexity*: Applies `f` exactly `last - first` times.

9 *Remarks*: If `f` returns a result, the result is ignored. Implementations do not have the freedom granted under 25.3.3 to make arbitrary copies of elements from the input sequence.

10 [*Note 4*: Does not return a copy of its `Function` parameter, since parallelization often does not permit efficient state accumulation. — *end note*]

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirectly_unary_invocable<projected<I, Proj>> Fun>
  constexpr ranges::for_each_result<I, Fun>
    ranges::for_each(I first, S last, Fun f, Proj proj = {});
template<input_range R, class Proj = identity,
         indirectly_unary_invocable<projected<iterator_t<R>, Proj>> Fun>
  constexpr ranges::for_each_result<borrowed_iterator_t<R>, Fun>
    ranges::for_each(R&& r, Fun f, Proj proj = {});
```

11 *Effects*: Calls `invoke(f, invoke(proj, *i))` for every iterator `i` in the range `[first, last)`, starting from `first` and proceeding to `last - 1`.

[*Note 5*: If the result of `invoke(proj, *i)` is a mutable reference, `f` can apply non-constant functions. — *end note*]

12 *Returns*: `{last, std::move(f)}`.

13 *Complexity*: Applies `f` and `proj` exactly `last - first` times.

14 *Remarks*: If `f` returns a result, the result is ignored.

15 [*Note 6*: The overloads in namespace `ranges` require `Fun` to model `copy_constructible`. — *end note*]

```
template<class InputIterator, class Size, class Function>
  constexpr InputIterator for_each_n(InputIterator first, Size n, Function f);
```

16 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

17 *Preconditions*: `n >= 0` is `true`. `Function` meets the *Cpp17MoveConstructible* requirements.

[*Note 7*: `Function` need not meet the requirements of *Cpp17CopyConstructible*. — *end note*]

18 *Effects*: Applies `f` to the result of dereferencing every iterator in the range `[first, first + n)` in order.

[*Note 8*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

19 *Returns*: `first + n`.

20 *Remarks*: If `f` returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Size, class Function>
  ForwardIterator for_each_n(ExecutionPolicy&& exec, ForwardIterator first, Size n,
                             Function f);
```

21 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

22 *Preconditions*: `n >= 0` is `true`. `Function` meets the *Cpp17CopyConstructible* requirements.

23 *Effects*: Applies `f` to the result of dereferencing every iterator in the range `[first, first + n)`.

[*Note 9*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

24 *Returns*: `first + n`.

25 *Remarks*: If `f` returns a result, the result is ignored. Implementations do not have the freedom granted under 25.3.3 to make arbitrary copies of elements from the input sequence.

```
template<input_iterator I, class Proj = identity,
         indirectly_unary_invocable<projected<I, Proj>> Fun>
  constexpr ranges::for_each_n_result<I, Fun>
    ranges::for_each_n(I first, iter_difference_t<I> n, Fun f, Proj proj = {});
```

26 *Preconditions*: `n >= 0` is `true`.

27 *Effects*: Calls `invoke(f, invoke(proj, *i))` for every iterator `i` in the range `[first, first + n)` in order.

[*Note 10*: If the result of `invoke(proj, *i)` is a mutable reference, `f` can apply non-constant functions. — *end note*]

28 *Returns*: `{first + n, std::move(f)}`.

29 *Remarks*: If `f` returns a result, the result is ignored.

30 [*Note 11*: The overload in namespace `ranges` requires `Fun` to model `copy_constructible`. — *end note*]

25.6.5 Find [alg.find]

```
template<class InputIterator, class T>
  constexpr InputIterator find(InputIterator first, InputIterator last,
                               const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
  ForwardIterator find(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                       const T& value);

template<class InputIterator, class Predicate>
  constexpr InputIterator find_if(InputIterator first, InputIterator last,
                                  Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator find_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                          Predicate pred);

template<class InputIterator, class Predicate>
  constexpr InputIterator find_if_not(InputIterator first, InputIterator last,
                                      Predicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator find_if_not(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last,
                              Predicate pred);

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr I ranges::find(I first, S last, const T& value, Proj proj = {});
template<input_range R, class T, class Proj = identity>
  requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr borrowed_iterator_t<R>
    ranges::find(R&& r, const T& value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr I ranges::find_if(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr borrowed_iterator_t<R>
    ranges::find_if(R&& r, Pred pred, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr I ranges::find_if_not(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr borrowed_iterator_t<R>
    ranges::find_if_not(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `*i == value` for `find`;

(1.2) — `pred(*i) != false` for `find_if`;

(1.3) — `pred(*i) == false` for `find_if_not`;

(1.4) — `bool(invoke(proj, *i) == value)` for `ranges::find`;

(1.5) — `bool(invoke(pred, invoke(proj, *i)))` for `ranges::find_if`;

(1.6) — `bool(!invoke(pred, invoke(proj, *i)))` for `ranges::find_if_not`.

2 *Returns*: The first iterator `i` in the range `[first, last)` for which E is `true`. Returns `last` if no such iterator is found.

3 *Complexity*: At most `last - first` applications of the corresponding predicate and any projection.

25.6.6 Find end [alg.find.end]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr ForwardIterator1
    find_end(ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator1
    find_end(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr ForwardIterator1
    find_end(ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2,
             BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  ForwardIterator1
    find_end(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
```

```
            ForwardIterator2 first2, ForwardIterator2 last2,
            BinaryPredicate pred);

template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr subrange<I1>
    ranges::find_end(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                     Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr borrowed_subrange_t<R1>
    ranges::find_end(R1&& r1, R2&& r2, Pred pred = {},
                     Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — `pred` be `equal_to{}` for the overloads with no parameter `pred`;

(1.2) — E be:

(1.2.1) — `pred(*(i + n), *(first2 + n))` for the overloads in namespace `std`;

(1.2.2) — `invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n)))` for the overloads in namespace `ranges`;

(1.3) — `i` be `last1` if `[first2, last2)` is empty, or if `(last2 - first2) > (last1 - first1)` is `true`, or if there is no iterator in the range `[first1, last1 - (last2 - first2))` such that for every non-negative integer `n < (last2 - first2)`, E is `true`. Otherwise `i` is the last such iterator in `[first1, last1 - (last2 - first2))`.

2 *Returns*:

(2.1) — `i` for the overloads in namespace `std`.

(2.2) — `{i, i + (i == last1 ? 0 : last2 - first2)}` for the overloads in namespace `ranges`.

3 *Complexity*: At most `(last2 - first2) * (last1 - first1 - (last2 - first2) + 1)` applications of the corresponding predicate and any projections.

25.6.7 Find first [alg.find.first.of]

```
template<class InputIterator, class ForwardIterator>
  constexpr InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
                  ForwardIterator first2, ForwardIterator last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator1
    find_first_of(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator, class ForwardIterator,
         class BinaryPredicate>
  constexpr InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
                  ForwardIterator first2, ForwardIterator last2,
                  BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  ForwardIterator1
    find_first_of(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2,
                  BinaryPredicate pred);
```

```
template<input_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr I1 ranges::find_first_of(I1 first1, S1 last1, I2 first2, S2 last2,
                                     Pred pred = {},
                                     Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr borrowed_iterator_t<R1>
    ranges::find_first_of(R1&& r1, R2&& r2,
                          Pred pred = {},
                          Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let E be:

(1.1) — `*i == *j` for the overloads with no parameter `pred`;

(1.2) — `pred(*i, *j) != false` for the overloads with a parameter `pred` and no parameter `proj1`;

(1.3) — `bool(invoke(pred, invoke(proj1, *i), invoke(proj2, *j)))` for the overloads with parameters `pred` and `proj1`.

2 *Effects*: Finds an element that matches one of a set of values.

3 *Returns*: The first iterator `i` in the range `[first1, last1)` such that for some iterator `j` in the range `[first2, last2)` E holds. Returns `last1` if `[first2, last2)` is empty or if no such iterator is found.

4 *Complexity*: At most `(last1-first1) * (last2-first2)` applications of the corresponding predicate and any projections.

25.6.8 Adjacent find [alg.adjacent.find]

```
template<class ForwardIterator>
  constexpr ForwardIterator
    adjacent_find(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    adjacent_find(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
  constexpr ForwardIterator
    adjacent_find(ForwardIterator first, ForwardIterator last,
                  BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
  ForwardIterator
    adjacent_find(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last,
                  BinaryPredicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_binary_predicate<projected<I, Proj>,
                                   projected<I, Proj>> Pred = ranges::equal_to>
  constexpr I ranges::adjacent_find(I first, S last, Pred pred = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_binary_predicate<projected<iterator_t<R>, Proj>,
                                   projected<iterator_t<R>, Proj>> Pred = ranges::equal_to>
  constexpr borrowed_iterator_t<R> ranges::adjacent_find(R&& r, Pred pred = {}, Proj proj = {});
```

1 Let E be:

(1.1) — `*i == *(i + 1)` for the overloads with no parameter `pred`;

(1.2) — `pred(*i, *(i + 1)) != false` for the overloads with a parameter `pred` and no parameter `proj`;

(1.3) — `bool(invoke(pred, invoke(proj, *i), invoke(proj, *(i + 1))))` for the overloads with both parameters `pred` and `proj`.

2 *Returns*: The first iterator `i` such that both `i` and `i + 1` are in the range `[first, last)` for which E holds. Returns `last` if no such iterator is found.

3 *Complexity*: For the overloads with no `ExecutionPolicy`, exactly

$$\min(\texttt{(i - first) + 1}, \texttt{(last - first) - 1})$$

applications of the corresponding predicate, where `i` is `adjacent_find`'s return value. For the overloads with an `ExecutionPolicy`, $\mathcal{O}(\texttt{last - first})$ applications of the corresponding predicate, and no more than twice as many applications of any projection.

25.6.9 Count [alg.count]

```
template<class InputIterator, class T>
  constexpr typename iterator_traits<InputIterator>::difference_type
    count(InputIterator first, InputIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
  typename iterator_traits<ForwardIterator>::difference_type
    count(ExecutionPolicy&& exec,
          ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
  constexpr typename iterator_traits<InputIterator>::difference_type
    count_if(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  typename iterator_traits<ForwardIterator>::difference_type
    count_if(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr iter_difference_t<I>
    ranges::count(I first, S last, const T& value, Proj proj = {});
template<input_range R, class T, class Proj = identity>
  requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr range_difference_t<R>
    ranges::count(R&& r, const T& value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr iter_difference_t<I>
    ranges::count_if(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr range_difference_t<R>
    ranges::count_if(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `*i == value` for the overloads with no parameter `pred` or `proj`;

(1.2) — `pred(*i) != false` for the overloads with a parameter `pred` but no parameter `proj`;

(1.3) — `invoke(proj, *i) == value` for the overloads with a parameter `proj` but no parameter `pred`;

(1.4) — `bool(invoke(pred, invoke(proj, *i)))` for the overloads with both parameters `proj` and `pred`.

2 *Effects*: Returns the number of iterators `i` in the range `[first, last)` for which E holds.

3 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

25.6.10 Mismatch [mismatch]

```
template<class InputIterator1, class InputIterator2>
  constexpr pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  pair<ForwardIterator1, ForwardIterator2>
    mismatch(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
  constexpr pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  pair<ForwardIterator1, ForwardIterator2>
    mismatch(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
  constexpr pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  pair<ForwardIterator1, ForwardIterator2>
    mismatch(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
  constexpr pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2, InputIterator2 last2,
             BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  pair<ForwardIterator1, ForwardIterator2>
    mismatch(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2,
             BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr ranges::mismatch_result<I1, I2>
    ranges::mismatch(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                     Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr ranges::mismatch_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::mismatch(R1&& r1, R2&& r2, Pred pred = {},
                     Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `last2` be `first2 + (last1 - first1)` for the overloads with no parameter `last2` or `r2`.

2 Let E be:

(2.1) — `!(*(first1 + n) == *(first2 + n))` for the overloads with no parameter `pred`;

(2.2) — `pred(*(first1 + n), *(first2 + n)) == false` for the overloads with a parameter `pred` and no parameter `proj1`;

(2.3) — `!invoke(pred, invoke(proj1, *(first1 + n)), invoke(proj2, *(first2 + n)))` for the overloads with both parameters `pred` and `proj1`.

3 Let N be min(`last1 - first1`, `last2 - first2`).

4 *Returns*: `{ first1 + n, first2 + n }`, where `n` is the smallest integer in `[0, ` N`)` such that E holds, or N if no such integer exists.

5 *Complexity*: At most N applications of the corresponding predicate and any projections.

25.6.11 Equal [alg.equal]

```
template<class InputIterator1, class InputIterator2>
  constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  bool equal(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
  constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  bool equal(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
  constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  bool equal(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
  constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, InputIterator2 last2,
                       BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  bool equal(ExecutionPolicy&& exec,
             ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2,
             BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr bool ranges::equal(I1 first1, S1 last1, I2 first2, S2 last2,
                               Pred pred = {},
                               Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr bool ranges::equal(R1&& r1, R2&& r2, Pred pred = {},
                               Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — `last2` be `first2 + (last1 - first1)` for the overloads with no parameter `last2` or `r2`;

(1.2) — `pred` be `equal_to{}` for the overloads with no parameter `pred`;

(1.3) — E be:

(1.3.1) — `pred(*i, *(first2 + (i - first1)))` for the overloads with no parameter `proj1`;

(1.3.2) — `invoke(pred, invoke(proj1, *i), invoke(proj2, *(first2 + (i - first1))))` for the overloads with parameter `proj1`.

2 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if E holds for every iterator `i` in the range `[first1, last1)` Otherwise, returns `false`.

3 *Complexity*: If the types of `first1`, `last1`, `first2`, and `last2`:

(3.1) — meet the *Cpp17RandomAccessIterator* requirements (23.3.5.7) for the overloads in namespace `std`;

(3.2) — pairwise model `sized_sentinel_for` (23.3.4.8) for the overloads in namespace `ranges`,

and `last1 - first1 != last2 - first2`, then no applications of the corresponding predicate and each projection; otherwise,

(3.3) — For the overloads with no `ExecutionPolicy`, at most min(`last1 - first1`, `last2 - first2`) applications of the corresponding predicate and any projections.

(3.4) — For the overloads with an `ExecutionPolicy`, $\mathscr{O}$(min(`last1 - first1`, `last2 - first2`)) applications of the corresponding predicate.

25.6.12 Is permutation [alg.is.permutation]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2);
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, BinaryPredicate pred);
template<class ForwardIterator1, class ForwardIterator2>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, ForwardIterator2 last2);
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, ForwardIterator2 last2,
                                BinaryPredicate pred);
```

1 Let `last2` be `first2 + (last1 - first1)` for the overloads with no parameter named `last2`, and let `pred` be `equal_to{}` for the overloads with no parameter `pred`.

2 *Mandates*: `ForwardIterator1` and `ForwardIterator2` have the same value type.

3 *Preconditions*: The comparison function is an equivalence relation.

4 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range `[first2, last2)`, beginning with `ForwardIterator2 begin`, such that `equal(first1, last1, begin, pred)` returns `true`; otherwise, returns `false`.

5 *Complexity*: No applications of the corresponding predicate if `ForwardIterator1` and `ForwardIterator2` meet the requirements of random access iterators and `last1 - first1 != last2 - first2`. Otherwise, exactly `last1 - first1` applications of the corresponding predicate if `equal(first1, last1, first2, last2, pred)` would return `true`; otherwise, at worst $\mathscr{O}(N^2)$, where N has the value `last1 - first1`.

```
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
         sentinel_for<I2> S2, class Proj1 = identity, class Proj2 = identity,
         indirect_equivalence_relation<projected<I1, Proj1>,
                                       projected<I2, Proj2>> Pred = ranges::equal_to>
  constexpr bool ranges::is_permutation(I1 first1, S1 last1, I2 first2, S2 last2,
                                        Pred pred = {},
                                        Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_equivalence_relation<projected<iterator_t<R1>, Proj1>,
                                       projected<iterator_t<R2>, Proj2>> Pred = ranges::equal_to>
  constexpr bool ranges::is_permutation(R1&& r1, R2&& r2, Pred pred = {},
```

```
                                    Proj1 proj1 = {}, Proj2 proj2 = {});
```

6 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range `[first2, last2)`, bounded by `[pfirst, plast)`, such that `ranges::equal(first1, last1, pfirst, plast, pred, proj1, proj2)` returns `true`; otherwise, returns `false`.

7 *Complexity*: No applications of the corresponding predicate and projections if:

(7.1) — `S1` and `I1` model `sized_sentinel_for<S1, I1>`,

(7.2) — `S2` and `I2` model `sized_sentinel_for<S2, I2>`, and

(7.3) — `last1 - first1 != last2 - first2`.

Otherwise, exactly `last1 - first1` applications of the corresponding predicate and projections if `ranges::equal(first1, last1, first2, last2, pred, proj1, proj2)` would return `true`; otherwise, at worst $\mathcal{O}(N^2)$, where N has the value `last1 - first1`.

25.6.13 Search [alg.search]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr ForwardIterator1
    search(ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator1
    search(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr ForwardIterator1
    search(ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2,
           BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  ForwardIterator1
    search(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2,
           BinaryPredicate pred);
```

1 *Returns*: The first iterator `i` in the range `[first1, last1 - (last2-first2))` such that for every non-negative integer `n` less than `last2 - first2` the following corresponding conditions hold: `*(i + n) == *(first2 + n), pred(*(i + n), *(first2 + n)) != false`. Returns `first1` if `[first2, last2)` is empty, otherwise returns `last1` if no such iterator is found.

2 *Complexity*: At most `(last1 - first1) * (last2 - first2)` applications of the corresponding predicate.

```
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
         sentinel_for<I2> S2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr subrange<I1>
    ranges::search(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                   Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr borrowed_subrange_t<R1>
    ranges::search(R1&& r1, R2&& r2, Pred pred = {},
                   Proj1 proj1 = {}, Proj2 proj2 = {});
```

3 *Returns*:

(3.1) — `{i, i + (last2 - first2)}`, where `i` is the first iterator in the range `[first1, last1 - (last2 - first2))` such that for every non-negative integer `n` less than `last2 - first2` the condition

```
bool(invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n))))
```

is `true`.

(3.2) — Returns `{last1, last1}` if no such iterator exists.

4 *Complexity*: At most `(last1 - first1) * (last2 - first2)` applications of the corresponding predicate and projections.

```
template<class ForwardIterator, class Size, class T>
  constexpr ForwardIterator
    search_n(ForwardIterator first, ForwardIterator last,
             Size count, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
  ForwardIterator
    search_n(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last,
             Size count, const T& value);

template<class ForwardIterator, class Size, class T,
         class BinaryPredicate>
  constexpr ForwardIterator
    search_n(ForwardIterator first, ForwardIterator last,
             Size count, const T& value,
             BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T,
         class BinaryPredicate>
  ForwardIterator
    search_n(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last,
             Size count, const T& value,
             BinaryPredicate pred);
```

5 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

6 *Returns*: The first iterator `i` in the range `[first, last-count)` such that for every non-negative integer `n` less than `count` the following corresponding conditions hold: `*(i + n) == value, pred(*(i + n),value) != false`. Returns `last` if no such iterator is found.

7 *Complexity*: At most `last - first` applications of the corresponding predicate.

```
template<forward_iterator I, sentinel_for<I> S, class T,
         class Pred = ranges::equal_to, class Proj = identity>
  requires indirectly_comparable<I, const T*, Pred, Proj>
  constexpr subrange<I>
    ranges::search_n(I first, S last, iter_difference_t<I> count,
                     const T& value, Pred pred = {}, Proj proj = {});
template<forward_range R, class T, class Pred = ranges::equal_to,
         class Proj = identity>
  requires indirectly_comparable<iterator_t<R>, const T*, Pred, Proj>
  constexpr borrowed_subrange_t<R>
    ranges::search_n(R&& r, range_difference_t<R> count,
                     const T& value, Pred pred = {}, Proj proj = {});
```

8 *Returns*: `{i, i + count}` where `i` is the first iterator in the range `[first, last - count)` such that for every non-negative integer `n` less than `count`, the following condition holds: `invoke(pred, invoke(proj, *(i + n)), value)`. Returns `{last, last}` if no such iterator is found.

9 *Complexity*: At most `last - first` applications of the corresponding predicate and projection.

```
template<class ForwardIterator, class Searcher>
  constexpr ForwardIterator
    search(ForwardIterator first, ForwardIterator last, const Searcher& searcher);
```

10 *Effects*: Equivalent to: `return searcher(first, last).first;`

11 *Remarks*: `Searcher` need not meet the *Cpp17CopyConstructible* requirements.

25.7 Mutating sequence operations [alg.modifying.operations]

25.7.1 Copy [alg.copy]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator copy(InputIterator first, InputIterator last,
                                OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
  requires indirectly_copyable<I, O>
  constexpr ranges::copy_result<I, O> ranges::copy(I first, S last, O result);
template<input_range R, weakly_incrementable O>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::copy_result<borrowed_iterator_t<R>, O> ranges::copy(R&& r, O result);
```

1 Let N be `last - first`.

2 *Preconditions*: `result` is not in the range `[first, last)`.

3 *Effects*: Copies elements in the range `[first, last)` into the range `[result, result + `N`)` starting from `first` and proceeding to `last`. For each non-negative integer $n < N$, performs `*(result + `n`) = *(first + `n`)`.

4 *Returns*:

(4.1) — `result + `N for the overload in namespace `std`.

(4.2) — `{last, result + `N`}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly N assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2 copy(ExecutionPolicy&& policy,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result);
```

6 *Preconditions*: The ranges `[first, last)` and `[result, result + (last - first))` do not overlap.

7 *Effects*: Copies elements in the range `[first, last)` into the range `[result, result + (last - first))`. For each non-negative integer `n < (last - first)`, performs `*(result + n) = *(first + n)`.

8 *Returns*: `result + (last - first)`.

9 *Complexity*: Exactly `last - first` assignments.

```
template<class InputIterator, class Size, class OutputIterator>
  constexpr OutputIterator copy_n(InputIterator first, Size n,
                                  OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class Size, class ForwardIterator2>
  ForwardIterator2 copy_n(ExecutionPolicy&& exec,
                          ForwardIterator1 first, Size n,
                          ForwardIterator2 result);

template<input_iterator I, weakly_incrementable O>
  requires indirectly_copyable<I, O>
  constexpr ranges::copy_n_result<I, O>
    ranges::copy_n(I first, iter_difference_t<I> n, O result);
```

10 Let N be $\max(0, \texttt{n})$.

11 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

12 *Effects*: For each non-negative integer $i < N$, performs `*(result + `i`) = *(first + `i`)`.

13 *Returns*:

(13.1) — `result + `N for the overloads in namespace `std`.

(13.2) — `{first + `N`, result + `N`}` for the overload in namespace `ranges`.

14 *Complexity*: Exactly N assignments.

```
template<class InputIterator, class OutputIterator, class Predicate>
  constexpr OutputIterator copy_if(InputIterator first, InputIterator last,
                                   OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate>
  ForwardIterator2 copy_if(ExecutionPolicy&& exec,
                           ForwardIterator1 first, ForwardIterator1 last,
                           ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O>
  constexpr ranges::copy_if_result<I, O>
    ranges::copy_if(I first, S last, O result, Pred pred, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::copy_if_result<borrowed_iterator_t<R>, O>
    ranges::copy_if(R&& r, O result, Pred pred, Proj proj = {});
```

15 Let E be:

(15.1) — `bool(pred(*i))` for the overloads in namespace `std`;

(15.2) — `bool(invoke(pred, invoke(proj, *i)))` for the overloads in namespace `ranges`,

and N be the number of iterators `i` in the range `[first, last)` for which the condition E holds.

16 *Preconditions*: The ranges `[first, last)` and `[result, result + (last - first))` do not overlap.

[*Note 1*: For the overload with an `ExecutionPolicy`, there might be a performance cost if `iterator_traits<ForwardIterator1>::value_type` is not *Cpp17MoveConstructible* (Table 28). — *end note*]

17 *Effects*: Copies all of the elements referred to by the iterator `i` in the range `[first, last)` for which E is `true`.

18 *Returns*:

(18.1) — `result +` N for the overloads in namespace `std`.

(18.2) — `{last, result +` N`}` for the overloads in namespace `ranges`.

19 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

20 *Remarks*: Stable (16.4.6.8).

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
  constexpr BidirectionalIterator2
    copy_backward(BidirectionalIterator1 first,
                  BidirectionalIterator1 last,
                  BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
  requires indirectly_copyable<I1, I2>
  constexpr ranges::copy_backward_result<I1, I2>
    ranges::copy_backward(I1 first, S1 last, I2 result);
template<bidirectional_range R, bidirectional_iterator I>
  requires indirectly_copyable<iterator_t<R>, I>
  constexpr ranges::copy_backward_result<borrowed_iterator_t<R>, I>
    ranges::copy_backward(R&& r, I result);
```

21 Let N be `last - first`.

22 *Preconditions*: `result` is not in the range `(first, last]`.

23 *Effects*: Copies elements in the range `[first, last)` into the range `[result -` N`, result)` starting from `last - 1` and proceeding to `first`.[237] For each positive integer $n \leq N$, performs `*(result -` n`) = *(last -` n`)`.

24 *Returns*:

237) `copy_backward` can be used instead of copy when `last` is in the range `[result -` N`, result)`.

(24.1) — `result - ` N for the overload in namespace `std`.

(24.2) — `{last, result - ` N`}` for the overloads in namespace `ranges`.

25 *Complexity*: Exactly N assignments.

25.7.2 Move [alg.move]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator move(InputIterator first, InputIterator last,
                                OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
  requires indirectly_movable<I, O>
  constexpr ranges::move_result<I, O>
    ranges::move(I first, S last, O result);
template<input_range R, weakly_incrementable O>
  requires indirectly_movable<iterator_t<R>, O>
  constexpr ranges::move_result<borrowed_iterator_t<R>, O>
    ranges::move(R&& r, O result);
```

1 Let E be

(1.1) — `std::move(*(first + ` n`))` for the overload in namespace `std`;

(1.2) — `ranges::iter_move(first + ` n`)` for the overloads in namespace `ranges`.

Let N be `last - first`.

2 *Preconditions*: `result` is not in the range `[first, last)`.

3 *Effects*: Moves elements in the range `[first, last)` into the range `[result, result + ` N`)` starting from `first` and proceeding to `last`. For each non-negative integer $n < N$, performs `*(result + ` n`) = ` E.

4 *Returns*:

(4.1) — `result + ` N for the overload in namespace `std`.

(4.2) — `{last, result + ` N`}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly N assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2 move(ExecutionPolicy&& policy,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result);
```

6 Let N be `last - first`.

7 *Preconditions*: The ranges `[first, last)` and `[result, result + ` N`)` do not overlap.

8 *Effects*: Moves elements in the range `[first, last)` into the range `[result, result + ` N`)`. For each non-negative integer $n < N$, performs `*(result + ` n`) = std::move(*(first + ` n`))`.

9 *Returns*: `result + ` N.

10 *Complexity*: Exactly N assignments.

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
  constexpr BidirectionalIterator2
    move_backward(BidirectionalIterator1 first, BidirectionalIterator1 last,
                  BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
  requires indirectly_movable<I1, I2>
  constexpr ranges::move_backward_result<I1, I2>
    ranges::move_backward(I1 first, S1 last, I2 result);
template<bidirectional_range R, bidirectional_iterator I>
  requires indirectly_movable<iterator_t<R>, I>
  constexpr ranges::move_backward_result<borrowed_iterator_t<R>, I>
    ranges::move_backward(R&& r, I result);
```

11 Let E be

(11.1) — `std::move(*(last - `n`))` for the overload in namespace `std`;

(11.2) — `ranges::iter_move(last - `n`)` for the overloads in namespace `ranges`.

Let N be `last - first`.

12 *Preconditions*: `result` is not in the range `(first, last]`.

13 *Effects*: Moves elements in the range `[first, last)` into the range `[result - `N`, result)` starting from `last - 1` and proceeding to `first`.[238] For each positive integer $n \leq N$, performs `*(result - `n`) = `E.

14 *Returns*:

(14.1) — `result - `N for the overload in namespace `std`.

(14.2) — `{last, result - `N`}` for the overloads in namespace `ranges`.

15 *Complexity*: Exactly N assignments.

25.7.3 Swap [alg.swap]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr ForwardIterator2
    swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    swap_ranges(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2>
  requires indirectly_swappable<I1, I2>
  constexpr ranges::swap_ranges_result<I1, I2>
    ranges::swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
template<input_range R1, input_range R2>
  requires indirectly_swappable<iterator_t<R1>, iterator_t<R2>>
  constexpr ranges::swap_ranges_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::swap_ranges(R1&& r1, R2&& r2);
```

1 Let:

(1.1) — `last2` be `first2 + (last1 - first1)` for the overloads with no parameter named `last2`;

(1.2) — M be min(`last1 - first1`, `last2 - first2`).

2 *Preconditions*: The two ranges `[first1, last1)` and `[first2, last2)` do not overlap. For the overloads in namespace `std`, `*(first1 + `n`)` is swappable with (16.4.4.3) `*(first2 + `n`)`.

3 *Effects*: For each non-negative integer $n < M$ performs:

(3.1) — `swap(*(first1 + `n`), *(first2 + `n`))` for the overloads in namespace `std`;

(3.2) — `ranges::iter_swap(first1 + `n`, first2 + `n`)` for the overloads in namespace `ranges`.

4 *Returns*:

(4.1) — `last2` for the overloads in namespace `std`.

(4.2) — `{first1 + `M`, first2 + `M`}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly M swaps.

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);
```

6 *Preconditions*: `a` and `b` are dereferenceable. `*a` is swappable with (16.4.4.3) `*b`.

7 *Effects*: As if by `swap(*a, *b)`.

238) `move_backward` can be used instead of move when `last` is in the range `[result - `N`, result)`.

25.7.4 Transform [alg.transform]

```
template<class InputIterator, class OutputIterator,
         class UnaryOperation>
  constexpr OutputIterator
    transform(InputIterator first1, InputIterator last1,
              OutputIterator result, UnaryOperation op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class UnaryOperation>
  ForwardIterator2
    transform(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 result, UnaryOperation op);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    transform(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, OutputIterator result,
              BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class BinaryOperation>
  ForwardIterator
    transform(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator result,
              BinaryOperation binary_op);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
         copy_constructible F, class Proj = identity>
  requires indirectly_writable<O, indirect_result_t<F&, projected<I, Proj>>>
  constexpr ranges::unary_transform_result<I, O>
    ranges::transform(I first1, S last1, O result, F op, Proj proj = {});
template<input_range R, weakly_incrementable O, copy_constructible F,
         class Proj = identity>
  requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R>, Proj>>>
  constexpr ranges::unary_transform_result<borrowed_iterator_t<R>, O>
    ranges::transform(R&& r, O result, F op, Proj proj = {});
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, copy_constructible F, class Proj1 = identity,
         class Proj2 = identity>
  requires indirectly_writable<O, indirect_result_t<F&, projected<I1, Proj1>,
                                         projected<I2, Proj2>>>
  constexpr ranges::binary_transform_result<I1, I2, O>
    ranges::transform(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                      F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         copy_constructible F, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R1>, Proj1>,
                                         projected<iterator_t<R2>, Proj2>>>
  constexpr ranges::binary_transform_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::transform(R1&& r1, R2&& r2, O result,
                      F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — `last2` be `first2 + (last1 - first1)` for the overloads with parameter `first2` but no parameter `last2`;

(1.2) — N be `last1 - first1` for unary transforms, or min(`last1 - first1`, `last2 - first2`) for binary transforms;

(1.3) — E be

(1.3.1) — `op(*(first1 + (i - result)))` for unary transforms defined in namespace `std`;

(1.3.2) — `binary_op(*(first1 + (i - result)), *(first2 + (i - result)))` for binary transforms defined in namespace `std`;

(1.3.3) — `invoke(op, invoke(proj, *(first1 + (i - result))))` for unary transforms defined in namespace `ranges`;

(1.3.4) — `invoke(binary_op, invoke(proj1, *(first1 + (i - result))), invoke(proj2, *(first2 + (i - result))))` for binary transforms defined in namespace `ranges`.

2 *Preconditions*: `op` and `binary_op` do not invalidate iterators or subranges, nor modify elements in the ranges

(2.1) — `[first1, first1 +` N`]`,

(2.2) — `[first2, first2 +` N`]`, and

(2.3) — `[result, result +` N`]`.[239]

3 *Effects*: Assigns through every iterator `i` in the range `[result, result +` N`)` a new corresponding value equal to E.

4 *Returns*:

(4.1) — `result +` N for the overloads defined in namespace `std`.

(4.2) — `{first1 +` N`, result +` N`}` for unary transforms defined in namespace `ranges`.

(4.3) — `{first1 +` N`, first2 +` N`, result +` N`}` for binary transforms defined in namespace `ranges`.

5 *Complexity*: Exactly N applications of `op` or `binary_op`, and any projections. This requirement also applies to the overload with an `ExecutionPolicy`.

6 *Remarks*: `result` may be equal to `first1` or `first2`.

25.7.5 Replace [alg.replace]

```
template<class ForwardIterator, class T>
  constexpr void replace(ForwardIterator first, ForwardIterator last,
                         const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator, class T>
  void replace(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               const T& old_value, const T& new_value);

template<class ForwardIterator, class Predicate, class T>
  constexpr void replace_if(ForwardIterator first, ForwardIterator last,
                            Predicate pred, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator, class Predicate, class T>
  void replace_if(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last,
                  Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, class Proj = identity>
  requires indirectly_writable<I, const T2&> &&
           indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T1*>
  constexpr I
    ranges::replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = {});
template<input_range R, class T1, class T2, class Proj = identity>
  requires indirectly_writable<iterator_t<R>, const T2&> &&
           indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T1*>
  constexpr borrowed_iterator_t<R>
    ranges::replace(R&& r, const T1& old_value, const T2& new_value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_writable<I, const T&>
  constexpr I ranges::replace_if(I first, S last, Pred pred, const T& new_value, Proj proj = {});
```

239) The use of fully closed ranges is intentional.

```
template<input_range R, class T, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_writable<iterator_t<R>, const T&>
  constexpr borrowed_iterator_t<R>
    ranges::replace_if(R&& r, Pred pred, const T& new_value, Proj proj = {});
```

1 Let E be

(1.1) — `bool(*i == old_value)` for `replace`;

(1.2) — `bool(pred(*i))` for `replace_if`;

(1.3) — `bool(invoke(proj, *i) == old_value)` for `ranges::replace`;

(1.4) — `bool(invoke(pred, invoke(proj, *i)))` for `ranges::replace_if`.

2 *Mandates*: `new_value` is writable (23.3.1) to `first`.

3 *Effects*: Substitutes elements referred by the iterator `i` in the range `[first, last)` with `new_value`, when E is `true`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

```
template<class InputIterator, class OutputIterator, class T>
  constexpr OutputIterator
    replace_copy(InputIterator first, InputIterator last,
                 OutputIterator result,
                 const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
  ForwardIterator2
    replace_copy(ExecutionPolicy&& exec,
                 ForwardIterator1 first, ForwardIterator1 last,
                 ForwardIterator2 result,
                 const T& old_value, const T& new_value);

template<class InputIterator, class OutputIterator, class Predicate, class T>
  constexpr OutputIterator
    replace_copy_if(InputIterator first, InputIterator last,
                    OutputIterator result,
                    Predicate pred, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate, class T>
  ForwardIterator2
    replace_copy_if(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last,
                    ForwardIterator2 result,
                    Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, output_iterator<const T2&> O,
         class Proj = identity>
  requires indirectly_copyable<I, O> &&
           indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T1*>
  constexpr ranges::replace_copy_result<I, O>
    ranges::replace_copy(I first, S last, O result, const T1& old_value, const T2& new_value,
                         Proj proj = {});
template<input_range R, class T1, class T2, output_iterator<const T2&> O,
         class Proj = identity>
  requires indirectly_copyable<iterator_t<R>, O> &&
           indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T1*>
  constexpr ranges::replace_copy_result<borrowed_iterator_t<R>, O>
    ranges::replace_copy(R&& r, O result, const T1& old_value, const T2& new_value,
                         Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class T, output_iterator<const T&> O,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O>
  constexpr ranges::replace_copy_if_result<I, O>
```

```
    ranges::replace_copy_if(I first, S last, O result, Pred pred, const T& new_value,
                            Proj proj = {});
template<input_range R, class T, output_iterator<const T&> O, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::replace_copy_if_result<borrowed_iterator_t<R>, O>
    ranges::replace_copy_if(R&& r, O result, Pred pred, const T& new_value,
                            Proj proj = {});
```

6 Let E be

(6.1) — `bool(*(first + (i - result)) == old_value)` for `replace_copy`;

(6.2) — `bool(pred(*(first + (i - result))))` for `replace_copy_if`;

(6.3) — `bool(invoke(proj, *(first + (i - result))) == old_value)` for `ranges::replace_copy`;

(6.4) — `bool(invoke(pred, invoke(proj, *(first + (i - result)))))` for `ranges::replace_copy_if`.

7 *Mandates*: The results of the expressions `*first` and `new_value` are writable (23.3.1) to `result`.

8 *Preconditions*: The ranges `[first, last)` and `[result, result + (last - first))` do not overlap.

9 *Effects*: Assigns through every iterator `i` in the range `[result, result + (last - first))` a new corresponding value

(9.1) — `new_value` if E is `true` or

(9.2) — `*(first + (i - result))` otherwise.

10 *Returns*:

(10.1) — `result + (last - first)` for the overloads in namespace `std`.

(10.2) — `{last, result + (last - first)}` for the overloads in namespace `ranges`.

11 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

25.7.6 Fill [alg.fill]

```
template<class ForwardIterator, class T>
  constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
  void fill(ExecutionPolicy&& exec,
            ForwardIterator first, ForwardIterator last, const T& value);

template<class OutputIterator, class Size, class T>
  constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
  ForwardIterator fill_n(ExecutionPolicy&& exec,
                         ForwardIterator first, Size n, const T& value);

template<class T, output_iterator<const T&> O, sentinel_for<O> S>
  constexpr O ranges::fill(O first, S last, const T& value);
template<class T, output_range<const T&> R>
  constexpr borrowed_iterator_t<R> ranges::fill(R&& r, const T& value);
template<class T, output_iterator<const T&> O>
  constexpr O ranges::fill_n(O first, iter_difference_t<O> n, const T& value);
```

1 Let N be $\max(0, \texttt{n})$ for the `fill_n` algorithms, and `last - first` for the `fill` algorithms.

2 *Mandates*: The expression `value` is writable (23.3.1) to the output iterator. The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

3 *Effects*: Assigns `value` through all the iterators in the range `[first, first +` N`)`.

4 *Returns*: `first +` N.

5 *Complexity*: Exactly N assignments.

25.7.7 Generate [alg.generate]

```
template<class ForwardIterator, class Generator>
  constexpr void generate(ForwardIterator first, ForwardIterator last,
                          Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Generator>
  void generate(ExecutionPolicy&& exec,
                ForwardIterator first, ForwardIterator last,
                Generator gen);

template<class OutputIterator, class Size, class Generator>
  constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Size, class Generator>
  ForwardIterator generate_n(ExecutionPolicy&& exec,
                             ForwardIterator first, Size n, Generator gen);

template<input_or_output_iterator O, sentinel_for<O> S, copy_constructible F>
  requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
  constexpr O ranges::generate(O first, S last, F gen);
template<class R, copy_constructible F>
  requires invocable<F&> && output_range<R, invoke_result_t<F&>>
  constexpr borrowed_iterator_t<R> ranges::generate(R&& r, F gen);
template<input_or_output_iterator O, copy_constructible F>
  requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
  constexpr O ranges::generate_n(O first, iter_difference_t<O> n, F gen);
```

1 Let N be $\max(0, \mathtt{n})$ for the `generate_n` algorithms, and `last - first` for the `generate` algorithms.

2 *Mandates*: `Size` is convertible to an integral type (7.3.9, 11.4.8).

3 *Effects*: Assigns the result of successive evaluations of `gen()` through each iterator in the range `[first, first +` N`)`.

4 *Returns*: `first +` N.

5 *Complexity*: Exactly N evaluations of `gen()` and assignments.

25.7.8 Remove [alg.remove]

```
template<class ForwardIterator, class T>
  constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,
                                   const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
  ForwardIterator remove(ExecutionPolicy&& exec,
                         ForwardIterator first, ForwardIterator last,
                         const T& value);

template<class ForwardIterator, class Predicate>
  constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,
                                      Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator remove_if(ExecutionPolicy&& exec,
                            ForwardIterator first, ForwardIterator last,
                            Predicate pred);

template<permutable I, sentinel_for<I> S, class T, class Proj = identity>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr subrange<I> ranges::remove(I first, S last, const T& value, Proj proj = {});
template<forward_range R, class T, class Proj = identity>
  requires permutable<iterator_t<R>> &&
           indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr borrowed_subrange_t<R>
    ranges::remove(R&& r, const T& value, Proj proj = {});
template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr subrange<I> ranges::remove_if(I first, S last, Pred pred, Proj proj = {});
```

```
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R>
    ranges::remove_if(R&& r, Pred pred, Proj proj = {});
```

1 Let E be

(1.1) — `bool(*i == value)` for `remove`;

(1.2) — `bool(pred(*i))` for `remove_if`;

(1.3) — `bool(invoke(proj, *i) == value)` for `ranges::remove`;

(1.4) — `bool(invoke(pred, invoke(proj, *i)))` for `ranges::remove_if`.

2 *Preconditions*: For the algorithms in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements (Table 30).

3 *Effects*: Eliminates all the elements referred to by iterator `i` in the range `[first, last)` for which E holds.

4 *Returns*: Let j be the end of the resulting range. Returns:

(4.1) — j for the overloads in namespace `std`.

(4.2) — `{`j`, last}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

6 *Remarks*: Stable (16.4.6.8).

7 [*Note 1*: Each element in the range `[ret, last)`, where `ret` is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — *end note*]

```
template<class InputIterator, class OutputIterator, class T>
  constexpr OutputIterator
    remove_copy(InputIterator first, InputIterator last,
                OutputIterator result, const T& value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class T>
  ForwardIterator2
    remove_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result, const T& value);

template<class InputIterator, class OutputIterator, class Predicate>
  constexpr OutputIterator
    remove_copy_if(InputIterator first, InputIterator last,
                   OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate>
  ForwardIterator2
    remove_copy_if(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class T,
         class Proj = identity>
  requires indirectly_copyable<I, O> &&
           indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr ranges::remove_copy_result<I, O>
    ranges::remove_copy(I first, S last, O result, const T& value, Proj proj = {});
template<input_range R, weakly_incrementable O, class T, class Proj = identity>
  requires indirectly_copyable<iterator_t<R>, O> &&
           indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr ranges::remove_copy_result<borrowed_iterator_t<R>, O>
    ranges::remove_copy(R&& r, O result, const T& value, Proj proj = {});
```

```
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O>
  constexpr ranges::remove_copy_if_result<I, O>
    ranges::remove_copy_if(I first, S last, O result, Pred pred, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::remove_copy_if_result<borrowed_iterator_t<R>, O>
    ranges::remove_copy_if(R&& r, O result, Pred pred, Proj proj = {});
```

8 Let E be

(8.1) — `bool(*i == value)` for `remove_copy`;

(8.2) — `bool(pred(*i))` for `remove_copy_if`;

(8.3) — `bool(invoke(proj, *i) == value)` for `ranges::remove_copy`;

(8.4) — `bool(invoke(pred, invoke(proj, *i)))` for `ranges::remove_copy_if`.

9 Let N be the number of elements in `[first, last)` for which E is `false`.

10 *Mandates*: `*first` is writable (23.3.1) to `result`.

11 *Preconditions*: The ranges `[first, last)` and `[result, result + (last - first))` do not overlap.

[*Note 2*: For the overloads with an `ExecutionPolicy`, there might be a performance cost if `iterator_traits<ForwardIterator1>::value_type` does not meet the *Cpp17MoveConstructible* (Table 28) requirements. — *end note*]

12 *Effects*: Copies all the elements referred to by the iterator `i` in the range `[first, last)` for which E is `false`.

13 *Returns*:

(13.1) — `result +` N, for the algorithms in namespace `std`.

(13.2) — `{last, result +` N`}`, for the algorithms in namespace `ranges`.

14 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

15 *Remarks*: Stable (16.4.6.8).

25.7.9 Unique [alg.unique]

```
template<class ForwardIterator>
  constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator unique(ExecutionPolicy&& exec,
                         ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
  constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last,
                                   BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
  ForwardIterator unique(ExecutionPolicy&& exec,
                         ForwardIterator first, ForwardIterator last,
                         BinaryPredicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
  constexpr subrange<I> ranges::unique(I first, S last, C comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R>
    ranges::unique(R&& r, C comp = {}, Proj proj = {});
```

1 Let `pred` be `equal_to{}` for the overloads with no parameter `pred`, and let E be

(1.1) — `bool(pred(*(i - 1), *i))` for the overloads in namespace `std`;

(1.2) — `bool(invoke(comp, invoke(proj, *(i - 1)), invoke(proj, *i)))` for the overloads in namespace `ranges`.

2 *Preconditions*: For the overloads in namepace `std`, `pred` is an equivalence relation and the type of `*first` meets the *Cpp17MoveAssignable* requirements (Table 30).

3 *Effects*: For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator `i` in the range `[first + 1, last)` for which E is `true`.

4 *Returns*: Let j be the end of the resulting range. Returns:

(4.1) — j for the overloads in namespace `std`.

(4.2) — `{`j`, last}` for the overloads in namespace `ranges`.

5 *Complexity*: For nonempty ranges, exactly `(last - first) - 1` applications of the corresponding predicate and no more than twice as many applications of any projection.

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    unique_copy(InputIterator first, InputIterator last,
                OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    unique_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result);

template<class InputIterator, class OutputIterator,
         class BinaryPredicate>
  constexpr OutputIterator
    unique_copy(InputIterator first, InputIterator last,
                OutputIterator result, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  ForwardIterator2
    unique_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result, BinaryPredicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
         indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
  requires indirectly_copyable<I, O> &&
           (forward_iterator<I> ||
            (input_iterator<O> && same_as<iter_value_t<I>, iter_value_t<O>>) ||
            indirectly_copyable_storable<I, O>)
  constexpr ranges::unique_copy_result<I, O>
    ranges::unique_copy(I first, S last, O result, C comp = {}, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
         indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
  requires indirectly_copyable<iterator_t<R>, O> &&
           (forward_iterator<iterator_t<R>> ||
            (input_iterator<O> && same_as<range_value_t<R>, iter_value_t<O>>) ||
            indirectly_copyable_storable<iterator_t<R>, O>)
  constexpr ranges::unique_copy_result<borrowed_iterator_t<R>, O>
    ranges::unique_copy(R&& r, O result, C comp = {}, Proj proj = {});
```

6 Let `pred` be `equal_to{}` for the overloads in namespace `std` with no parameter `pred`, and let E be

(6.1) — `bool(pred(*i, *(i - 1)))` for the overloads in namespace `std`;

(6.2) — `bool(invoke(comp, invoke(proj, *i), invoke(proj, *(i - 1))))` for the overloads in namespace `ranges`.

7 *Mandates*: `*first` is writable (23.3.1) to `result`.

8 *Preconditions*:

(8.1) — The ranges `[first, last)` and `[result, result+(last-first))` do not overlap.

(8.2) — For the overloads in namespace `std`:

(8.2.1) — The comparison function is an equivalence relation.

(8.2.2) — For the overloads with no `ExecutionPolicy`, let `T` be the value type of `InputIterator`. If `InputIterator` meets the *Cpp17ForwardIterator* requirements, then there are no additional requirements for `T`. Otherwise, if `OutputIterator` meets the *Cpp17ForwardIterator* requirements and its value type is the same as `T`, then `T` meets the *Cpp17CopyAssignable* (Table 31) requirements. Otherwise, `T` meets both the *Cpp17CopyConstructible* (Table 29) and *Cpp17CopyAssignable* requirements.

[*Note 1*: For the overloads with an `ExecutionPolicy`, there might be a performance cost if the value type of `ForwardIterator1` does not meet both the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. — *end note*]

9 *Effects*: Copies only the first element from every consecutive group of equal elements referred to by the iterator `i` in the range `[first, last)` for which E holds.

10 *Returns*:

(10.1) — `result +` N for the overloads in namespace `std`.

(10.2) — `{last, result +` N`}` for the overloads in namespace `ranges`.

11 *Complexity*: Exactly `last - first - 1` applications of the corresponding predicate and no more than twice as many applications of any projection.

25.7.10 Reverse [alg.reverse]

```
template<class BidirectionalIterator>
  constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
  void reverse(ExecutionPolicy&& exec,
               BidirectionalIterator first, BidirectionalIterator last);

template<bidirectional_iterator I, sentinel_for<I> S>
  requires permutable<I>
  constexpr I ranges::reverse(I first, S last);
template<bidirectional_range R>
  requires permutable<iterator_t<R>>
  constexpr borrowed_iterator_t<R> ranges::reverse(R&& r);
```

1 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

2 *Effects*: For each non-negative integer `i < (last - first) / 2`, applies `std::iter_swap`, or `ranges::iter_swap` for the overloads in namespace `ranges`, to all pairs of iterators `first + i, (last - i) - 1`.

3 *Returns*: `last` for the overloads in namespace `ranges`.

4 *Complexity*: Exactly `(last - first)/2` swaps.

```
template<class BidirectionalIterator, class OutputIterator>
  constexpr OutputIterator
    reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
                 OutputIterator result);
template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>
  ForwardIterator
    reverse_copy(ExecutionPolicy&& exec,
                 BidirectionalIterator first, BidirectionalIterator last,
                 ForwardIterator result);

template<bidirectional_iterator I, sentinel_for<I> S, weakly_incrementable O>
  requires indirectly_copyable<I, O>
  constexpr ranges::reverse_copy_result<I, O>
    ranges::reverse_copy(I first, S last, O result);
```

```
template<bidirectional_range R, weakly_incrementable O>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::reverse_copy_result<borrowed_iterator_t<R>, O>
    ranges::reverse_copy(R&& r, O result);
```

5 Let N be `last - first`.

6 *Preconditions*: The ranges `[first, last)` and `[result, result +` N`)` do not overlap.

7 *Effects*: Copies the range `[first, last)` to the range `[result, result +` N`)` such that for every non-negative integer `i <` N the following assignment takes place: `*(result +` N `- 1 - i) = *(first + i)`.

8 *Returns*:

(8.1) — `result +` N for the overloads in namespace `std`.

(8.2) — `{last, result +` N`}` for the overloads in namespace `ranges`.

9 *Complexity*: Exactly N assignments.

25.7.11 Rotate [alg.rotate]

```
template<class ForwardIterator>
  constexpr ForwardIterator
    rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    rotate(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<permutable I, sentinel_for<I> S>
  constexpr subrange<I> ranges::rotate(I first, I middle, S last);
```

1 *Preconditions*: `[first, middle)` and `[middle, last)` are valid ranges. For the overloads in namespace `std`, `ForwardIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of `*first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

2 *Effects*: For each non-negative integer `i < (last - first)`, places the element from the position `first + i` into position `first + (i + (last - middle)) % (last - first)`.

[*Note 1*: This is a left rotate. — *end note*]

3 *Returns*:

(3.1) — `first + (last - middle)` for the overloads in namespace `std`.

(3.2) — `{first + (last - middle), last}` for the overload in namespace `ranges`.

4 *Complexity*: At most `last - first` swaps.

```
template<forward_range R>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R> ranges::rotate(R&& r, iterator_t<R> middle);
```

5 *Effects*: Equivalent to: `return ranges::rotate(ranges::begin(r), middle, ranges::end(r));`

```
template<class ForwardIterator, class OutputIterator>
  constexpr OutputIterator
    rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
                OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    rotate_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 middle, ForwardIterator1 last,
                ForwardIterator2 result);

  template<forward_iterator I, sentinel_for<I> S, weakly_incrementable O>
    requires indirectly_copyable<I, O>
    constexpr ranges::rotate_copy_result<I, O>
```

```
ranges::rotate_copy(I first, I middle, S last, O result);
```

6 Let N be `last - first`.

7 *Preconditions*: `[first, middle)` and `[middle, last)` are valid ranges. The ranges `[first, last)` and `[result, result +` N`)` do not overlap.

8 *Effects*: Copies the range `[first, last)` to the range `[result, result +` N`)` such that for each non-negative integer $i < N$ the following assignment takes place: `*(result +` i`) = *(first + (`i `+ (middle - first)) %` N`)`.

9 *Returns*:

(9.1) — `result +` N for the overloads in namespace `std`.

(9.2) — `{last, result +` N`}` for the overload in namespace `ranges`.

10 *Complexity*: Exactly N assignments.

```
template<forward_range R, weakly_incrementable O>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::rotate_copy_result<borrowed_iterator_t<R>, O>
    ranges::rotate_copy(R&& r, iterator_t<R> middle, O result);
```

11 *Effects*: Equivalent to:

```
return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), result);
```

25.7.12 Sample [alg.random.sample]

```
template<class PopulationIterator, class SampleIterator,
         class Distance, class UniformRandomBitGenerator>
  SampleIterator sample(PopulationIterator first, PopulationIterator last,
                        SampleIterator out, Distance n,
                        UniformRandomBitGenerator&& g);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Gen>
  requires (forward_iterator<I> || random_access_iterator<O>) &&
           indirectly_copyable<I, O> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);
template<input_range R, weakly_incrementable O, class Gen>
  requires (forward_range<R> || random_access_iterator<O>) &&
           indirectly_copyable<iterator_t<R>, O> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  O ranges::sample(R&& r, O out, range_difference_t<R> n, Gen&& g);
```

1 *Mandates*: For the overload in namespace `std`, `Distance` is an integer type and `*first` is writable (23.3.1) to `out`.

2 *Preconditions*: `out` is not in the range `[first, last)`. For the overload in namespace `std`:

(2.1) — `PopulationIterator` meets the *Cpp17InputIterator* requirements (23.3.5.3).

(2.2) — `SampleIterator` meets the *Cpp17OutputIterator* requirements (23.3.5.4).

(2.3) — `SampleIterator` meets the *Cpp17RandomAccessIterator* requirements (23.3.5.7) unless `PopulationIterator` meets the *Cpp17ForwardIterator* requirements (23.3.5.5).

(2.4) — `remove_reference_t<UniformRandomBitGenerator>` meets the requirements of a uniform random bit generator type (26.6.3.3).

3 *Effects*: Copies min(`last - first`, `n`) elements (the *sample*) from `[first, last)` (the *population*) to `out` such that each possible sample has equal probability of appearance.

[*Note 1*: Algorithms that obtain such effects include *selection sampling* and *reservoir sampling*. — *end note*]

4 *Returns*: The end of the resulting sample range.

5 *Complexity*: $\mathcal{O}$(`last - first`).

6 *Remarks*:

(6.1) — For the overload in namespace `std`, stable if and only if `PopulationIterator` meets the *Cpp17ForwardIterator* requirements. For the first overload in namespace `ranges`, stable if and only if `I` models `forward_iterator`.

(6.2) — To the extent that the implementation of this function makes use of random numbers, the object `g` serves as the implementation's source of randomness.

25.7.13 Shuffle [alg.random.shuffle]

```
template<class RandomAccessIterator, class UniformRandomBitGenerator>
  void shuffle(RandomAccessIterator first,
               RandomAccessIterator last,
               UniformRandomBitGenerator&& g);

template<random_access_iterator I, sentinel_for<I> S, class Gen>
  requires permutable<I> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  I ranges::shuffle(I first, S last, Gen&& g);
template<random_access_range R, class Gen>
  requires permutable<iterator_t<R>> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);
```

1 *Preconditions*: For the overload in namespace `std`:

(1.1) — `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

(1.2) — The type `remove_reference_t<UniformRandomBitGenerator>` meets the uniform random bit generator (26.6.3.3) requirements.

2 *Effects*: Permutes the elements in the range `[first, last)` such that each possible permutation of those elements has equal probability of appearance.

3 *Returns*: `last` for the overloads in namespace `ranges`.

4 *Complexity*: Exactly `(last - first) - 1` swaps.

5 *Remarks*: To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation's source of randomness.

25.7.14 Shift [alg.shift]

```
template<class ForwardIterator>
  constexpr ForwardIterator
    shift_left(ForwardIterator first, ForwardIterator last,
               typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
               typename iterator_traits<ForwardIterator>::difference_type n);
```

1 *Preconditions*: `n >= 0` is `true`. The type of `*first` meets the *Cpp17MoveAssignable* requirements.

2 *Effects*: If `n == 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + n + i` into position `first + i` for each non-negative integer `i < (last - first) - n`. In the first overload case, does so in order starting from `i = 0` and proceeding to `i = (last - first) - n - 1`.

3 *Returns*: `first + (last - first - n)` if `n < last - first`, otherwise `first`.

4 *Complexity*: At most `(last - first) - n` assignments.

```
template<class ForwardIterator>
  constexpr ForwardIterator
    shift_right(ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);
```

```
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);
```

5 *Preconditions*: `n >= 0` is `true`. The type of `*first` meets the *Cpp17MoveAssignable* requirements. `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements (23.3.5.6) or the *Cpp17ValueSwappable* requirements.

6 *Effects*: If `n == 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + i` into position `first + n + i` for each non-negative integer `i < (last - first) - n`. In the first overload case, if `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements, does so in order starting from `i = (last - first) - n - 1` and proceeding to `i = 0`.

7 *Returns*: `first + n` if `n < last - first`, otherwise `last`.

8 *Complexity*: At most `(last - first) - n` assignments or swaps.

25.8 Sorting and related operations [alg.sorting]

25.8.1 General [alg.sorting.general]

1 The operations in 25.8 defined directly in namespace `std` have two versions: one that takes a function object of type `Compare` and one that uses an `operator<`.

2 `Compare` is a function object type (20.14) that meets the requirements for a template parameter named `BinaryPredicate` (25.2). The return value of the function call operation applied to an object of type `Compare`, when contextually converted to `bool` (7.3), yields `true` if the first argument of the call is less than the second, and `false` otherwise. `Compare comp` is used throughout for algorithms assuming an ordering relation.

3 For all algorithms that take `Compare`, there is a version that uses `operator<` instead. That is, `comp(*i, *j) != false` defaults to `*i < *j != false`. For algorithms other than those described in 25.8.4, `comp` shall induce a strict weak ordering on the values.

4 The term *strict* refers to the requirement of an irreflexive relation (`!comp(x, x)` for all `x`), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define `equiv(a, b)` as `!comp(a, b) && !comp(b, a)`, then the requirements are that `comp` and `equiv` both be transitive relations:

(4.1) — `comp(a, b) && comp(b, c)` implies `comp(a, c)`

(4.2) — `equiv(a, b) && equiv(b, c)` implies `equiv(a, c)`

[*Note 1*: Under these conditions, it can be shown that

(4.3) — `equiv` is an equivalence relation,

(4.4) — `comp` induces a well-defined relation on the equivalence classes determined by `equiv`, and

(4.5) — the induced relation is a strict total ordering.

— *end note*]

5 A sequence is *sorted with respect to a* `comp` *and* `proj` for a comparator and projection `comp` and `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence,

```
bool(invoke(comp, invoke(proj, *(i + n)), invoke(proj, *i)))
```

is `false`.

6 A sequence `[start, finish)` is *partitioned with respect to an expression* `f(e)` if there exists an integer `n` such that for all `0 <= i < (finish - start)`, `f(*(start + i))` is `true` if and only if `i < n`.

7 In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an `operator==`, but an equivalence relation induced by the strict weak ordering. That is, two elements `a` and `b` are considered equivalent if and only if `!(a < b) && !(b < a)`.

25.8.2 Sorting [alg.sort]

25.8.2.1 `sort` [sort]

```
template<class RandomAccessIterator>
  constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class ExecutionPolicy, class RandomAccessIterator>
  void sort(ExecutionPolicy&& exec,
            RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void sort(RandomAccessIterator first, RandomAccessIterator last,
                      Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void sort(ExecutionPolicy&& exec,
            RandomAccessIterator first, RandomAccessIterator last,
            Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::sort(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

3 *Effects*: Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: Let N be `last - first`. $\mathscr{O}(N \log N)$ comparisons and projections.

25.8.2.2 `stable_sort` [stable.sort]

```
template<class RandomAccessIterator>
  void stable_sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void stable_sort(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                   Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void stable_sort(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator last,
                   Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  I ranges::stable_sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  borrowed_iterator_t<R>
    ranges::stable_sort(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

3 *Effects*: Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: Let N be `last - first`. If enough extra memory is available, $N \log(N)$ comparisons. Otherwise, at most $N \log^2(N)$ comparisons. In either case, twice as many projections as the number of comparisons.

6 *Remarks*: Stable (16.4.6.8).

25.8.2.3 `partial_sort` [partial.sort]

```
template<class RandomAccessIterator>
  constexpr void partial_sort(RandomAccessIterator first,
                              RandomAccessIterator middle,
                              RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void partial_sort(ExecutionPolicy&& exec,
                    RandomAccessIterator first,
                    RandomAccessIterator middle,
                    RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void partial_sort(RandomAccessIterator first,
                              RandomAccessIterator middle,
                              RandomAccessIterator last,
                              Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void partial_sort(ExecutionPolicy&& exec,
                    RandomAccessIterator first,
                    RandomAccessIterator middle,
                    RandomAccessIterator last,
                    Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: `[first, middle)` and `[middle, last)` are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

3 *Effects*: Places the first `middle - first` elements from the range `[first, last)` as sorted with respect to `comp` and `proj` into the range `[first, middle)`. The rest of the elements in the range `[middle, last)` are placed in an unspecified order.

4 *Returns*: `last` for the overload in namespace `ranges`.

5 *Complexity*: Approximately `(last - first) * log(middle - first)` comparisons, and twice as many projections.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

6 *Effects*: Equivalent to:

```
return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

25.8.2.4 `partial_sort_copy` [partial.sort.copy]

```
template<class InputIterator, class RandomAccessIterator>
  constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last);
```

```
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
  RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator,
         class Compare>
  constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last,
                      Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator,
         class Compare>
  RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last,
                      Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
           indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
  constexpr ranges::partial_sort_copy_result<I1, I2>
    ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
                              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, random_access_range R2, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
           sortable<iterator_t<R2>, Comp, Proj2> &&
           indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>,
                                      projected<iterator_t<R2>, Proj2>>
  constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
                              Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let N be min(`last - first`, `result_last - result_first`). Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Mandates*: For the overloads in namespace `std`, the expression `*first` is writable (23.3.1) to `result_first`.

3 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), the type of `*result_first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

4 For iterators `a1` and `b1` in `[first, last)`, and iterators `x2` and `y2` in `[result_first, result_last)`, after evaluating the assignment `*y2 = *b1`, let E be the value of

```
bool(invoke(comp, invoke(proj1, *a1), invoke(proj2, *y2))).
```

Then, after evaluating the assignment `*x2 = *a1`, E is equal to

```
bool(invoke(comp, invoke(proj2, *x2), invoke(proj2, *y2))).
```

[*Note 1*: Writing a value from the input range into the output range does not affect how it is ordered by `comp` and `proj1` or `proj2`. —*end note*]

5 *Effects*: Places the first N elements as sorted with respect to `comp` and `proj2` into the range `[result_first, result_first +` N`)`.

6 *Returns*:

(6.1) — `result_first +` N for the overloads in namespace `std`.

(6.2) — `{last, result_first +` N`}` for the overloads in namespace `ranges`.

7 *Complexity*: Approximately `(last - first) * log` N comparisons, and twice as many projections.

25.8.2.5 is_sorted [is.sorted]

```
template<class ForwardIterator>
  constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);
```

1 *Effects*: Equivalent to: `return is_sorted_until(first, last) == last;`

```
template<class ExecutionPolicy, class ForwardIterator>
  bool is_sorted(ExecutionPolicy&& exec,
                 ForwardIterator first, ForwardIterator last);
```

2 *Effects*: Equivalent to:

```
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```
template<class ForwardIterator, class Compare>
  constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                           Compare comp);
```

3 *Effects*: Equivalent to: `return is_sorted_until(first, last, comp) == last;`

```
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  bool is_sorted(ExecutionPolicy&& exec,
                 ForwardIterator first, ForwardIterator last,
                 Compare comp);
```

4 *Effects*: Equivalent to:

```
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_sorted(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_sorted(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Effects*: Equivalent to: `return ranges::is_sorted_until(first, last, comp, proj) == last;`

```
template<class ForwardIterator>
  constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
  constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last,
                    Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last,
                    Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

7 *Returns*: The last iterator `i` in `[first, last]` for which the range `[first, i)` is sorted with respect to `comp` and `proj`.

8 *Complexity*: Linear.

25.8.3 Nth element [alg.nth.element]

```
template<class RandomAccessIterator>
  constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                             RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void nth_element(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator nth,
                   RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                             RandomAccessIterator last,  Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void nth_element(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator nth,
                   RandomAccessIterator last, Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: `[first, nth)` and `[nth, last)` are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of `*first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

3 *Effects*: After `nth_element` the element in the position pointed to by `nth` is the element that would be in that position if the whole range were sorted with respect to `comp` and `proj`, unless `nth == last`. Also for every iterator `i` in the range `[first, nth)` and every iterator `j` in the range `[nth, last)` it holds that: `bool(invoke(comp, invoke(proj, *j), invoke(proj, *i)))` is `false`.

4 *Returns*: `last` for the overload in namespace `ranges`.

5 *Complexity*: For the overloads with no `ExecutionPolicy`, linear on average. For the overloads with an `ExecutionPolicy`, $\mathcal{O}(N)$ applications of the predicate, and $\mathcal{O}(N \log N)$ swaps, where $N =$ `last - first`.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});
```

6 *Effects*: Equivalent to:

```
return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);
```

25.8.4 Binary search [alg.binary.search]

25.8.4.1 General [alg.binary.search.general]

1 All of the algorithms in 25.8.4 are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

25.8.4.2 lower_bound [lower.bound]

```
template<class ForwardIterator, class T>
  constexpr ForwardIterator
    lower_bound(ForwardIterator first, ForwardIterator last,
                const T& value);

template<class ForwardIterator, class T, class Compare>
  constexpr ForwardIterator
    lower_bound(ForwardIterator first, ForwardIterator last,
                const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::lower_bound(I first, S last, const T& value, Comp comp = {},
                                  Proj proj = {});
template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of `[first, last)` are partitioned with respect to the expression `bool(invoke(comp, invoke(proj, e), value))`.

3 *Returns*: The furthermost iterator `i` in the range `[first, last]` such that for every iterator `j` in the range `[first, i)`, `bool(invoke(comp, invoke(proj, *j), value))` is `true`.

4 *Complexity*: At most $\log_2(\texttt{last - first}) + \mathcal{O}(1)$ comparisons and projections.

25.8.4.3 upper_bound [upper.bound]

```
template<class ForwardIterator, class T>
  constexpr ForwardIterator
    upper_bound(ForwardIterator first, ForwardIterator last,
                const T& value);

template<class ForwardIterator, class T, class Compare>
  constexpr ForwardIterator
    upper_bound(ForwardIterator first, ForwardIterator last,
                const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of `[first, last)` are partitioned with respect to the expression `!bool(invoke(comp, value, invoke(proj, e)))`.

3 *Returns*: The furthermost iterator `i` in the range `[first, last]` such that for every iterator `j` in the range `[first, i)`, `!bool(invoke(comp, value, invoke(proj, *j)))` is `true`.

4 *Complexity*: At most $\log_2(\texttt{last - first}) + \mathcal{O}(1)$ comparisons and projections.

25.8.4.4 equal_range [equal.range]

```
template<class ForwardIterator, class T>
  constexpr pair<ForwardIterator, ForwardIterator>
    equal_range(ForwardIterator first,
                ForwardIterator last, const T& value);
```

```
template<class ForwardIterator, class T, class Compare>
  constexpr pair<ForwardIterator, ForwardIterator>
    equal_range(ForwardIterator first,
                ForwardIterator last, const T& value,
                Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr subrange<I>
    ranges::equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr borrowed_subrange_t<R>
    ranges::equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of `[first, last)` are partitioned with respect to the expressions `bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of `[first, last)`, `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 *Returns*:

(3.1) — For the overloads in namespace `std`:

```
{lower_bound(first, last, value, comp),
 upper_bound(first, last, value, comp)}
```

(3.2) — For the overloads in namespace `ranges`:

```
{ranges::lower_bound(first, last, value, comp, proj),
 ranges::upper_bound(first, last, value, comp, proj)}
```

4 *Complexity*: At most $2 * \log_2(\texttt{last - first}) + \mathcal{O}(1)$ comparisons and projections.

25.8.4.5 `binary_search` [binary.search]

```
template<class ForwardIterator, class T>
  constexpr bool
    binary_search(ForwardIterator first, ForwardIterator last,
                  const T& value);

template<class ForwardIterator, class T, class Compare>
  constexpr bool
    binary_search(ForwardIterator first, ForwardIterator last,
                  const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {},
                                       Proj proj = {});
template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {},
                                       Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of `[first, last)` are partitioned with respect to the expressions `bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of `[first, last)`, `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 *Returns*: `true` if and only if for some iterator `i` in the range `[first, last)`, `!bool(invoke(comp, invoke(proj, *i), value)) && !bool(invoke(comp, value, invoke(proj, *i)))` is `true`.

4 *Complexity*: At most $\log_2(\texttt{last - first}) + \mathcal{O}(1)$ comparisons and projections.

25.8.5 Partitions [alg.partitions]

```
template<class InputIterator, class Predicate>
  constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool is_partitioned(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});
```

1 Let `proj` be `identity{}` for the overloads with no parameter named `proj`.

2 *Returns*: `true` if and only if the elements `e` of `[first, last)` are partitioned with respect to the expression `bool(invoke(pred, invoke(proj, e)))`.

3 *Complexity*: Linear. At most `last - first` applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
  constexpr ForwardIterator
    partition(ForwardIterator first, ForwardIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator
    partition(ExecutionPolicy&& exec,
              ForwardIterator first, ForwardIterator last, Predicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr subrange<I>
    ranges::partition(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R>
    ranges::partition(R&& r, Pred pred, Proj proj = {});
```

4 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, `x`)))`.

5 *Preconditions*: For the overloads in namespace `std`, `ForwardIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

6 *Effects*: Places all the elements `e` in `[first, last)` that satisfy E(`e`) before all the elements that do not.

7 *Returns*: Let `i` be an iterator such that E(`*j`) is `true` for every iterator `j` in `[first, i)` and `false` for every iterator `j` in `[i, last)`. Returns:

(7.1) — `i` for the overloads in namespace `std`.

(7.2) — `{i, last}` for the overloads in namespace `ranges`.

8 *Complexity*: Let $N =$ `last - first`:

(8.1) — For the overload with no `ExecutionPolicy`, exactly N applications of the predicate and projection. At most $N/2$ swaps if the type of `first` meets the *Cpp17BidirectionalIterator* requirements for the overloads in namespace `std` or models `bidirectional_iterator` for the overloads in namespace `ranges`, and at most N swaps otherwise.

(8.2) — For the overload with an `ExecutionPolicy`, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```
template<class BidirectionalIterator, class Predicate>
  BidirectionalIterator
    stable_partition(BidirectionalIterator first, BidirectionalIterator last, Predicate pred);
```

```
template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
  BidirectionalIterator
    stable_partition(ExecutionPolicy&& exec,
                     BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  requires permutable<I>
  subrange<I> ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});
template<bidirectional_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  borrowed_subrange_t<R> ranges::stable_partition(R&& r, Pred pred, Proj proj = {});
```

9 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, `x`)))`.

10 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

11 *Effects*: Places all the elements `e` in `[first, last)` that satisfy E(`e`) before all the elements that do not. The relative order of the elements in both groups is preserved.

12 *Returns*: Let `i` be an iterator such that for every iterator `j` in `[first, i)`, E(`*j`) is `true`, and for every iterator `j` in the range `[i, last)`, E(`*j`) is `false`. Returns:

(12.1) — `i` for the overloads in namespace `std`.

(12.2) — `{i, last}` for the overloads in namespace `ranges`.

13 *Complexity*: Let N = `last - first`:

(13.1) — For the overloads with no `ExecutionPolicy`, at most $N \log N$ swaps, but only $\mathcal{O}(N)$ swaps if there is enough extra memory. Exactly N applications of the predicate and projection.

(13.2) — For the overload with an `ExecutionPolicy`, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```
template<class InputIterator, class OutputIterator1, class OutputIterator2, class Predicate>
  constexpr pair<OutputIterator1, OutputIterator2>
    partition_copy(InputIterator first, InputIterator last,
                   OutputIterator1 out_true, OutputIterator2 out_false, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class ForwardIterator1,
         class ForwardIterator2, class Predicate>
  pair<ForwardIterator1, ForwardIterator2>
    partition_copy(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last,
                   ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O1, weakly_incrementable O2,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O1> && indirectly_copyable<I, O2>
  constexpr ranges::partition_copy_result<I, O1, O2>
    ranges::partition_copy(I first, S last, O1 out_true, O2 out_false, Pred pred,
                           Proj proj = {});
template<input_range R, weakly_incrementable O1, weakly_incrementable O2,
         class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, O1> &&
           indirectly_copyable<iterator_t<R>, O2>
  constexpr ranges::partition_copy_result<borrowed_iterator_t<R>, O1, O2>
    ranges::partition_copy(R&& r, O1 out_true, O2 out_false, Pred pred, Proj proj = {});
```

14 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, `x`)))`.

15 *Mandates*: For the overloads in namespace `std`, the expression `*first` is writable (23.3.1) to `out_true` and `out_false`.

16 *Preconditions*: The input range and output ranges do not overlap.

[*Note 1*: For the overload with an `ExecutionPolicy`, there might be a performance cost if `first`'s value type does not meet the *Cpp17CopyConstructible* requirements. — *end note*]

17 *Effects*: For each iterator `i` in `[first, last)`, copies `*i` to the output range beginning with `out_true` if E(`*i`) is `true`, or to the output range beginning with `out_false` otherwise.

18 *Returns*: Let `o1` be the end of the output range beginning at `out_true`, and `o2` the end of the output range beginning at `out_false`. Returns

(18.1) — `{o1, o2}` for the overloads in namespace `std`.

(18.2) — `{last, o1, o2}` for the overloads in namespace `ranges`.

19 *Complexity*: Exactly `last - first` applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
  constexpr ForwardIterator
    partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr I ranges::partition_point(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr borrowed_iterator_t<R>
    ranges::partition_point(R&& r, Pred pred, Proj proj = {});
```

20 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, `x`)))`.

21 *Preconditions*: The elements `e` of `[first, last)` are partitioned with respect to E(`e`).

22 *Returns*: An iterator `mid` such that E(`*i`) is `true` for all iterators `i` in `[first, mid)`, and `false` for all iterators `i` in `[mid, last)`.

23 *Complexity*: $\mathcal{O}(\log($`last - first`$))$ applications of `pred` and `proj`.

25.8.6 Merge [alg.merge]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    merge(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    merge(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
  constexpr OutputIterator
    merge(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    merge(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result, Compare comp);
```

```
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less, class Proj1 = identity,
         class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  constexpr ranges::merge_result<I1, I2, O>
    ranges::merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                  Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
  constexpr ranges::merge_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::merge(R1&& r1, R2&& r2, O result,
                  Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let N be `(last1 - first1) + (last2 - first2)`. Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.

2 *Preconditions*: The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Copies all the elements of the two ranges `[first1, last1)` and `[first2, last2)` into the range `[result, result_last)`, where `result_last` is `result +` N. If an element `a` precedes `b` in an input range, `a` is copied into the output range before `b`. If `e1` is an element of `[first1, last1)` and `e2` of `[first2, last2)`, `e2` is copied into the output range before `e1` if and only if `bool(invoke(comp, invoke(proj2, e2), invoke(proj1, e1)))` is `true`.

4 *Returns*:

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5 *Complexity*:

(5.1) — For the overloads with no `ExecutionPolicy`, at most $N - 1$ comparisons and applications of each projection.

(5.2) — For the overloads with an `ExecutionPolicy`, $\mathcal{O}(N)$ comparisons.

6 *Remarks*: Stable (16.4.6.8).

```
template<class BidirectionalIterator>
  void inplace_merge(BidirectionalIterator first,
                     BidirectionalIterator middle,
                     BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
  void inplace_merge(ExecutionPolicy&& exec,
                     BidirectionalIterator first,
                     BidirectionalIterator middle,
                     BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
  void inplace_merge(BidirectionalIterator first,
                     BidirectionalIterator middle,
                     BidirectionalIterator last, Compare comp);
template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
  void inplace_merge(ExecutionPolicy&& exec,
                     BidirectionalIterator first,
                     BidirectionalIterator middle,
                     BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

7 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

8 *Preconditions*: `[first, middle)` and `[middle, last)` are valid ranges sorted with respect to `comp` and `proj`. For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

9 *Effects*: Merges two sorted consecutive ranges `[first, middle)` and `[middle, last)`, putting the result of the merge into the range `[first, last)`. The resulting range is sorted with respect to `comp` and `proj`.

10 *Returns*: `last` for the overload in namespace `ranges`.

11 *Complexity*: Let $N =$ `last - first`:

(11.1) — For the overloads with no `ExecutionPolicy`, and if enough additional memory is available, exactly $N - 1$ comparisons.

(11.2) — Otherwise, $\mathcal{O}(N \log N)$ comparisons.

In either case, twice as many projections as comparisons.

12 *Remarks*: Stable (16.4.6.8).

```
template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  borrowed_iterator_t<R>
    ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

13 *Effects*: Equivalent to:

```
return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

25.8.7 Set operations on sorted structures [alg.set.operations]

25.8.7.1 General [alg.set.operations.general]

1 Subclause 25.8.7 defines all the basic set operations on sorted structures. They also work with `multiset`s (22.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to `multiset`s in a standard way by defining `set_union` to contain the maximum number of occurrences of every element, `set_intersection` to contain the minimum, and so on.

25.8.7.2 `includes` [includes]

```
template<class InputIterator1, class InputIterator2>
  constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                          InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  bool includes(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
  constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                          InputIterator2 first2, InputIterator2 last2,
                          Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
  bool includes(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2,
                Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>,
                                    projected<I2, Proj2>> Comp = ranges::less>
  constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {},
                                  Proj1 proj1 = {}, Proj2 proj2 = {});
```

```
template<input_range R1, input_range R2, class Proj1 = identity,
         class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                                    projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
  constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {},
                                  Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.

2 *Preconditions*: The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively.

3 *Returns*: `true` if and only if `[first2, last2)` is a subsequence of `[first1, last1)`.

[*Note 1*: A sequence S is a subsequence of another sequence T if S can be obtained from T by removing some, all, or none of T's elements and keeping the remaining elements in the same order. — *end note*]

4 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

25.8.7.3 set_union [set.union]

```
template<class InputIterator1, class InputIterator2, class OutputIterator>
  constexpr OutputIterator
    set_union(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_union(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result);

template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
  constexpr OutputIterator
    set_union(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    set_union(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  constexpr ranges::set_union_result<I1, I2, O>
    ranges::set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
  constexpr ranges::set_union_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.

4 *Returns*: Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8). If `[first1, last1)` contains m elements that are equivalent to each other and `[first2, last2)` contains n elements that are equivalent to them, then all m elements from the first range are copied to the output range, in order, and then the final $\max(n - m, 0)$ elements from the second range are copied to the output range, in order.

25.8.7.4 `set_intersection` [set.intersection]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    set_intersection(InputIterator1 first1, InputIterator1 last1,
                     InputIterator2 first2, InputIterator2 last2,
                     OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_intersection(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2, ForwardIterator2 last2,
                     ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
  constexpr OutputIterator
    set_intersection(InputIterator1 first1, InputIterator1 last1,
                     InputIterator2 first2, InputIterator2 last2,
                     OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    set_intersection(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2, ForwardIterator2 last2,
                     ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  constexpr ranges::set_intersection_result<I1, I2, O>
    ranges::set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                             Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
  constexpr ranges::set_intersection_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::set_intersection(R1&& r1, R2&& r2, O result,
                             Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The ranges [first1, last1) and [first2, last2) are sorted with respect to comp and proj1 or proj2, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.

4 *Returns*: Let result_last be the end of the constructed range. Returns

(4.1) — result_last for the overloads in namespace std.

(4.2) — {last1, last2, result_last} for the overloads in namespace ranges.

5 *Complexity*: At most 2 * ((last1 - first1) + (last2 - first2)) - 1 comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8). If [first1, last1) contains m elements that are equivalent to each other and [first2, last2) contains n elements that are equivalent to them, the first $\min(m, n)$ elements are copied from the first range to the output range, in order.

25.8.7.5 set_difference [set.difference]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    set_difference(InputIterator1 first1, InputIterator1 last1,
                   InputIterator2 first2, InputIterator2 last2,
                   OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_difference(ExecutionPolicy&& exec,
                   ForwardIterator1 first1, ForwardIterator1 last1,
                   ForwardIterator2 first2, ForwardIterator2 last2,
                   ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
  constexpr OutputIterator
    set_difference(InputIterator1 first1, InputIterator1 last1,
                   InputIterator2 first2, InputIterator2 last2,
                   OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    set_difference(ExecutionPolicy&& exec,
                   ForwardIterator1 first1, ForwardIterator1 last1,
                   ForwardIterator2 first2, ForwardIterator2 last2,
                   ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  constexpr ranges::set_difference_result<I1, O>
    ranges::set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                           Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
  constexpr ranges::set_difference_result<borrowed_iterator_t<R1>, O>
    ranges::set_difference(R1&& r1, R2&& r2, O result,
                           Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let comp be less{}, and proj1 and proj2 be identity{} for the overloads with no parameters by those names.

2 *Preconditions*: The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Copies the elements of the range `[first1, last1)` which are not present in the range `[first2, last2)` to the range beginning at `result`. The elements in the constructed range are sorted.

4 *Returns*: Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, result_last}` for the overloads in namespace `ranges`.

5 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6 *Remarks*: If `[first1, last1)` contains m elements that are equivalent to each other and `[first2, last2)` contains n elements that are equivalent to them, the last $\max(m - n, 0)$ elements from `[first1, last1)` is copied to the output range, in order.

25.8.7.6 `set_symmetric_difference` [set.symmetric.difference]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                             InputIterator2 first2, InputIterator2 last2,
                             OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_symmetric_difference(ExecutionPolicy&& exec,
                             ForwardIterator1 first1, ForwardIterator1 last1,
                             ForwardIterator2 first2, ForwardIterator2 last2,
                             ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
  constexpr OutputIterator
    set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                             InputIterator2 first2, InputIterator2 last2,
                             OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    set_symmetric_difference(ExecutionPolicy&& exec,
                             ForwardIterator1 first1, ForwardIterator1 last1,
                             ForwardIterator2 first2, ForwardIterator2 last2,
                             ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  constexpr ranges::set_symmetric_difference_result<I1, I2, O>
    ranges::set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                                     Comp comp = {}, Proj1 proj1 = {},
                                     Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
  constexpr ranges::set_symmetric_difference_result<borrowed_iterator_t<R1>,
                                                    borrowed_iterator_t<R2>, O>
    ranges::set_symmetric_difference(R1&& r1, R2&& r2, O result, Comp comp = {},
```

```
                        Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Copies the elements of the range `[first1, last1)` that are not present in the range `[first2, last2)`, and the elements of the range `[first2, last2)` that are not present in the range `[first1, last1)` to the range beginning at `result`. The elements in the constructed range are sorted.

4 *Returns*: Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8). If `[first1, last1)` contains m elements that are equivalent to each other and `[first2, last2)` contains n elements that are equivalent to them, then $|m-n|$ of those elements shall be copied to the output range: the last $m-n$ of these elements from `[first1, last1)` if $m > n$, and the last $n-m$ of these elements from `[first2, last2)` if $m < n$. In either case, the elements are copied in order.

25.8.8 Heap operations [alg.heap.operations]

25.8.8.1 General [alg.heap.operations.general]

1 A random access range `[a, b)` is a *heap with respect to* `comp` *and* `proj` for a comparator and projection `comp` and `proj` if its elements are organized such that:

(1.1) — With N `= b - a`, for all i, $0 < i < N$, `bool(invoke(comp, invoke(proj, a[`$\lfloor \frac{i-1}{2} \rfloor$`]), invoke(proj, a[`$i$`])))` is `false`.

(1.2) — `*a` may be removed by `pop_heap`, or a new element added by `push_heap`, in $\mathcal{O}(\log N)$ time.

2 These properties make heaps useful as priority queues.

3 `make_heap` converts a range into a heap and `sort_heap` turns a heap into a sorted sequence.

25.8.8.2 push_heap [push.heap]

```
template<class RandomAccessIterator>
  constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
                           Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::push_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The range `[first, last - 1)` is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveConstructible* requirements (Table 28) and the *Cpp17MoveAssignable* requirements (Table 30).

3 *Effects*: Places the value in the location `last - 1` into the resulting heap `[first, last)`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $\log(\texttt{last - first})$ comparisons and twice as many projections.

25.8.8.3 pop_heap [pop.heap]

```
template<class RandomAccessIterator>
  constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                          Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The range `[first, last)` is a valid non-empty heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

3 *Effects*: Swaps the value in the location `first` with the value in the location `last - 1` and makes `[first, last - 1)` into a heap with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $2\log(\texttt{last - first})$ comparisons and twice as many projections.

25.8.8.4 make_heap [make.heap]

```
template<class RandomAccessIterator>
  constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
                           Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::make_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::make_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

3 *Effects*: Constructs a heap with respect to `comp` and `proj` out of the range `[first, last)`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $3(\texttt{last - first})$ comparisons and twice as many projections.

25.8.8.5 sort_heap [sort.heap]

```
template<class RandomAccessIterator>
  constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
  constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last,
                           Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::sort_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The range `[first, last)` is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 28) and *Cpp17MoveAssignable* (Table 30) requirements.

3 *Effects*: Sorts elements in the heap `[first, last)` with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $2N \log N$ comparisons, where $N =$ `last - first`, and twice as many projections.

25.8.8.6 `is_heap` [is.heap]

```
template<class RandomAccessIterator>
  constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);
```

1 *Effects*: Equivalent to: `return is_heap_until(first, last) == last;`

```
template<class ExecutionPolicy, class RandomAccessIterator>
  bool is_heap(ExecutionPolicy&& exec,
               RandomAccessIterator first, RandomAccessIterator last);
```

2 *Effects*: Equivalent to:

```
return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```
template<class RandomAccessIterator, class Compare>
  constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
                         Compare comp);
```

3 *Effects*: Equivalent to: `return is_heap_until(first, last, comp) == last;`

```
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  bool is_heap(ExecutionPolicy&& exec,
               RandomAccessIterator first, RandomAccessIterator last,
               Compare comp);
```

4 *Effects*: Equivalent to:

```
return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;
```

```
template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_heap(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Effects*: Equivalent to: `return ranges::is_heap_until(first, last, comp, proj) == last;`

```
template<class RandomAccessIterator>
  constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class ExecutionPolicy, class RandomAccessIterator>
  RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                  RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                  RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

7 *Returns*: The last iterator `i` in `[first, last]` for which the range `[first, i)` is a heap with respect to `comp` and `proj`.

8 *Complexity*: Linear.

25.8.9 Minimum and maximum [alg.min.max]

```
template<class T>
  constexpr const T& min(const T& a, const T& b);
template<class T, class Compare>
  constexpr const T& min(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

1 *Preconditions*: For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 26).

2 *Returns*: The smaller value. Returns the first argument when the arguments are equivalent.

3 *Complexity*: Exactly one comparison and two applications of the projection, if any.

4 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr T min(initializer_list<T> r);
template<class T, class Compare>
  constexpr T min(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  constexpr range_value_t<R>
    ranges::min(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Preconditions*: `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17-CopyConstructible* requirements. For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 26).

6 *Returns*: The smallest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the smallest.

7 *Complexity*: Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

8 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
  constexpr const T& max(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr const T& ranges::max(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

9 *Preconditions*: For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 26).

10 *Returns*: The larger value. Returns the first argument when the arguments are equivalent.

11 *Complexity*: Exactly one comparison and two applications of the projection, if any.

12 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr T max(initializer_list<T> r);
template<class T, class Compare>
  constexpr T max(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr T ranges::max(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  constexpr range_value_t<R>
    ranges::max(R&& r, Comp comp = {}, Proj proj = {});
```

13 *Preconditions*: `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17-CopyConstructible* requirements. For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 26).

14 *Returns*: The largest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the largest.

15 *Complexity*: Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

16 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
  constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_result<const T&>
    ranges::minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

17 *Preconditions*: For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 26).

18 *Returns*: `{b, a}` if `b` is smaller than `a`, and `{a, b}` otherwise.

19 *Complexity*: Exactly one comparison and two applications of the projection, if any.

20 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr pair<T, T> minmax(initializer_list<T> t);
template<class T, class Compare>
  constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_result<T>
    ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  constexpr ranges::minmax_result<range_value_t<R>>
    ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});
```

21 *Preconditions*: `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17CopyConstructible* requirements. For the first form, type `T` meets the *Cpp17LessThanComparable* requirements (Table 26).

22 *Returns*: Let `X` be the return type. Returns `X{x, y}`, where `x` is a copy of the leftmost element with the smallest value and `y` a copy of the rightmost element with the largest value in the input range.

23 *Complexity*: At most $(3/2)$`ranges::distance(r)` applications of the corresponding predicate and twice as many applications of the projection, if any.

24 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class ForwardIterator>
  constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator min_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
  constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
                                        Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  ForwardIterator min_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::min_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::min_element(R&& r, Comp comp = {}, Proj proj = {});
```

25 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

26 *Returns*: The first iterator `i` in the range `[first, last)` such that for every iterator `j` in the range `[first, last)`,

```
bool(invoke(comp, invoke(proj, *j), invoke(proj, *i)))
```

is `false`. Returns `last` if `first == last`.

27 *Complexity*: Exactly $\max($`last - first - 1`$, 0)$ comparisons and twice as many projections.

```
template<class ForwardIterator>
  constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator max_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class Compare>
  constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last,
                                        Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  ForwardIterator max_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last,
                              Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::max_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::max_element(R&& r, Comp comp = {}, Proj proj = {});
```

28 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

29 *Returns*: The first iterator `i` in the range `[first, last)` such that for every iterator `j` in the range `[first, last)`,

```
bool(invoke(comp, invoke(proj, *i), invoke(proj, *j)))
```

is `false`. Returns `last` if `first == last`.

30 *Complexity*: Exactly $\max($`last - first - 1`$, 0)$ comparisons and twice as many projections.

```
template<class ForwardIterator>
  constexpr pair<ForwardIterator, ForwardIterator>
    minmax_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  pair<ForwardIterator, ForwardIterator>
    minmax_element(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
  constexpr pair<ForwardIterator, ForwardIterator>
    minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  pair<ForwardIterator, ForwardIterator>
    minmax_element(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_result<I>
    ranges::minmax_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_result<borrowed_iterator_t<R>>
    ranges::minmax_element(R&& r, Comp comp = {}, Proj proj = {});
```

31 *Returns*: `{first, first}` if `[first, last)` is empty, otherwise `{m, M}`, where `m` is the first iterator in `[first, last)` such that no iterator in the range refers to a smaller element, and where `M` is the last iterator[240] in `[first, last)` such that no iterator in the range refers to a larger element.

32 *Complexity*: Let N be `last - first`. At most $\max(\lfloor \frac{3}{2}(N-1) \rfloor, 0)$ comparisons and twice as many applications of the projection, if any.

25.8.10 Bounded value [alg.clamp]

```
template<class T>
  constexpr const T& clamp(const T& v, const T& lo, const T& hi);
template<class T, class Compare>
  constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);
```

240) This behavior intentionally differs from `max_element`.

```
template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr const T&
    ranges::clamp(const T& v, const T& lo, const T& hi, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` for the overloads with no parameter `comp`, and let `proj` be `identity{}` for the overloads with no parameter `proj`.

2 *Preconditions*: `bool(invoke(comp, invoke(proj, hi), invoke(proj, lo)))` is `false`. For the first form, type `T` meets the *Cpp17LessThanComparable* requirements (Table 26).

3 *Returns*: `lo` if `bool(invoke(comp, invoke(proj, v), invoke(proj, lo)))` is `true`, `hi` if `bool(invoke(comp, invoke(proj, hi), invoke(proj, v)))` is `true`, otherwise `v`.

4 [*Note 1*: If NaN is avoided, `T` can be a floating-point type. — *end note*]

5 *Complexity*: At most two comparisons and three applications of the projection.

25.8.11 Lexicographical comparison [alg.lex.comparison]

```
template<class InputIterator1, class InputIterator2>
  constexpr bool
    lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  bool
    lexicographical_compare(ExecutionPolicy&& exec,
                            ForwardIterator1 first1, ForwardIterator1 last1,
                            ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
  constexpr bool
    lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, InputIterator2 last2,
                            Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Compare>
  bool
    lexicographical_compare(ExecutionPolicy&& exec,
                            ForwardIterator1 first1, ForwardIterator1 last1,
                            ForwardIterator2 first2, ForwardIterator2 last2,
                            Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>,
                                    projected<I2, Proj2>> Comp = ranges::less>
  constexpr bool
    ranges::lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,
                                    Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
         class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                                    projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
  constexpr bool
    ranges::lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},
                                    Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 *Returns*: `true` if and only if the sequence of elements defined by the range `[first1, last1)` is lexicographically less than the sequence of elements defined by the range `[first2, last2)`.

2 *Complexity*: At most $2\min($`last1 - first1`, `last2 - first2`$)$ applications of the corresponding comparison and each projection, if any.

3 *Remarks*: If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence.

Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

4 [*Example 1*: `ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2)` could be implemented as:

```
for ( ; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
  if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
  if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
}
return first1 == last1 && first2 != last2;
```

— *end example*]

5 [*Note 1*: An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence. — *end note*]

25.8.12 Three-way comparison algorithms [alg.three.way]

```
template<class InputIterator1, class InputIterator2, class Cmp>
  constexpr auto
    lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                      InputIterator2 b2, InputIterator2 e2,
                                      Cmp comp)
      -> decltype(comp(*b1, *b2));
```

1 *Mandates*: `decltype(comp(*b1, *b2))` is a comparison category type.

2 *Effects*: Lexicographically compares two ranges and produces a result of the strongest applicable comparison category type. Equivalent to:

```
for ( ; b1 != e1 && b2 != e2; void(++b1), void(++b2) )
  if (auto cmp = comp(*b1,*b2); cmp != 0)
    return cmp;
return b1 != e1 ? strong_ordering::greater :
       b2 != e2 ? strong_ordering::less :
                  strong_ordering::equal;
```

```
template<class InputIterator1, class InputIterator2>
  constexpr auto
    lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                      InputIterator2 b2, InputIterator2 e2);
```

3 *Effects*: Equivalent to:

```
return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());
```

25.8.13 Permutation generators [alg.permutation.generators]

```
template<class BidirectionalIterator>
  constexpr bool next_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
  constexpr bool next_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr ranges::next_permutation_result<I>
    ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr ranges::next_permutation_result<borrowed_iterator_t<R>>
    ranges::next_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

3 *Effects*: Takes a sequence defined by the range `[first, last)` and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

4 *Returns*: Let `B` be `true` if a next permutation was found and otherwise `false`. Returns:

(4.1) — `B` for the overloads in namespace `std`.

(4.2) — `{ last, B }` for the overloads in namespace `ranges`.

5 *Complexity*: At most `(last - first) / 2` swaps.

```
template<class BidirectionalIterator>
  constexpr bool prev_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
  constexpr bool prev_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr ranges::prev_permutation_result<I>
    ranges::prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});
template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr ranges::prev_permutation_result<borrowed_iterator_t<R>>
    ranges::prev_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

7 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

8 *Effects*: Takes a sequence defined by the range `[first, last)` and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

9 *Returns*: Let `B` be `true` if a previous permutation was found and otherwise `false`. Returns:

(9.1) — `B` for the overloads in namespace `std`.

(9.2) — `{ last, B }` for the overloads in namespace `ranges`.

10 *Complexity*: At most `(last - first) / 2` swaps.

25.9 Header `<numeric>` synopsis [numeric.ops.overview]

```
namespace std {
  // 25.10.3, accumulate
  template<class InputIterator, class T>
    constexpr T accumulate(InputIterator first, InputIterator last, T init);
  template<class InputIterator, class T, class BinaryOperation>
    constexpr T accumulate(InputIterator first, InputIterator last, T init,

    template<class T>
      constexpr T* midpoint(T* a, T* b);
  }
```

25.10 Generalized numeric operations [numeric.ops]

25.10.1 General [numeric.ops.general]

1 [*Note 1*: The use of closed ranges as well as semi-open ranges to specify requirements throughout 25.10 is intentional. — *end note*]

25.10.2 Definitions [numerics.defns]

1 Define *GENERALIZED_NONCOMMUTATIVE_SUM*(op, a1, ..., aN) as follows:

(1.1) — a1 when N is 1, otherwise

(1.2) — op(*GENERALIZED_NONCOMMUTATIVE_SUM*(op, a1, ..., aK), *GENERALIZED_NONCOMMUTATIVE_SUM*(op, aM, ..., aN)) for any K where $1 < K + 1 = M \leq N$.

2 Define *GENERALIZED_SUM*(op, a1, ..., aN) as *GENERALIZED_NONCOMMUTATIVE_SUM*(op, b1, ..., bN), where b1, ..., bN may be any permutation of a1, ..., aN.

25.10.3 Accumulate [accumulate]

```
template<class InputIterator, class T>
  constexpr T accumulate(InputIterator first, InputIterator last, T init);
template<class InputIterator, class T, class BinaryOperation>
  constexpr T accumulate(InputIterator first, InputIterator last, T init,
                         BinaryOperation binary_op);
```

1 *Preconditions*: T meets the *Cpp17CopyConstructible* (Table 29) and *Cpp17CopyAssignable* (Table 31) requirements. In the range [first, last], binary_op neither modifies elements nor invalidates iterators or subranges.[241]

2 *Effects*: Computes its result by initializing the accumulator acc with the initial value init and then modifies it with acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) for every iterator i in the range [first, last) in order.[242]

25.10.4 Reduce [reduce]

```
template<class InputIterator>
  constexpr typename iterator_traits<InputIterator>::value_type
    reduce(InputIterator first, InputIterator last);
```

1 *Effects*: Equivalent to:

```
return reduce(first, last,
              typename iterator_traits<InputIterator>::value_type{});
```

```
template<class ExecutionPolicy, class ForwardIterator>
  typename iterator_traits<ForwardIterator>::value_type
    reduce(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last);
```

2 *Effects*: Equivalent to:

```
return reduce(std::forward<ExecutionPolicy>(exec), first, last,
              typename iterator_traits<ForwardIterator>::value_type{});
```

```
template<class InputIterator, class T>
  constexpr T reduce(InputIterator first, InputIterator last, T init);
```

3 *Effects*: Equivalent to:

```
return reduce(first, last, init, plus<>());
```

241) The use of fully closed ranges is intentional.

242) accumulate is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.

```
template<class ExecutionPolicy, class ForwardIterator, class T>
  T reduce(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last, T init);
```

4 *Effects*: Equivalent to:

```
return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());
```

```
template<class InputIterator, class T, class BinaryOperation>
  constexpr T reduce(InputIterator first, InputIterator last, T init,
                     BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
  T reduce(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last, T init,
           BinaryOperation binary_op);
```

5 *Mandates*: All of

(5.1) — `binary_op(init, *first)`,

(5.2) — `binary_op(*first, init)`,

(5.3) — `binary_op(init, init)`, and

(5.4) — `binary_op(*first, *first)`

are convertible to `T`.

6 *Preconditions*:

(6.1) — `T` meets the *Cpp17MoveConstructible* (Table 28) requirements.

(6.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the range `[first, last]`.

7 *Returns*: *GENERALIZED_SUM*`(binary_op, init, *i, ...)` for every `i` in `[first, last)`.

8 *Complexity*: $\mathcal{O}$(`last - first`) applications of `binary_op`.

9 [*Note 1*: The difference between `reduce` and `accumulate` is that `reduce` applies `binary_op` in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative `binary_op` such as floating-point addition. — *end note*]

25.10.5 Inner product [inner.product]

```
template<class InputIterator1, class InputIterator2, class T>
  constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, T init);
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
  constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, T init,
                            BinaryOperation1 binary_op1,
                            BinaryOperation2 binary_op2);
```

1 *Preconditions*: `T` meets the *Cpp17CopyConstructible* (Table 29) and *Cpp17CopyAssignable* (Table 31) requirements. In the ranges `[first1, last1]` and `[first2, first2 + (last1 - first1)]` `binary_op1` and `binary_op2` neither modifies elements nor invalidates iterators or subranges.[243]

2 *Effects*: Computes its result by initializing the accumulator `acc` with the initial value `init` and then modifying it with `acc = std::move(acc) + (*i1) * (*i2)` or `acc = binary_op1(std::move(acc), binary_op2(*i1, *i2))` for every iterator `i1` in the range `[first1, last1)` and iterator `i2` in the range `[first2, first2 + (last1 - first1))` in order.

25.10.6 Transform reduce [transform.reduce]

```
template<class InputIterator1, class InputIterator2, class T>
  constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                               InputIterator2 first2,
                               T init);
```

1 *Effects*: Equivalent to:

243) The use of fully closed ranges is intentional.

```
return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T>
  T transform_reduce(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2,
                     T init);
```

2 *Effects*: Equivalent to:

```
return transform_reduce(std::forward<ExecutionPolicy>(exec),
                        first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
  constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                               InputIterator2 first2,
                               T init,
                               BinaryOperation1 binary_op1,
                               BinaryOperation2 binary_op2);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
  T transform_reduce(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2,
                     T init,
                     BinaryOperation1 binary_op1,
                     BinaryOperation2 binary_op2);
```

3 *Mandates*: All of

(3.1) — `binary_op1(init, init)`,

(3.2) — `binary_op1(init, binary_op2(*first1, *first2))`,

(3.3) — `binary_op1(binary_op2(*first1, *first2), init)`, and

(3.4) — `binary_op1(binary_op2(*first1, *first2), binary_op2(*first1, *first2))`

are convertible to `T`.

4 *Preconditions*:

(4.1) — `T` meets the *Cpp17MoveConstructible* (Table 28) requirements.

(4.2) — Neither `binary_op1` nor `binary_op2` invalidates subranges, nor modifies elements in the ranges `[first1, last1]` and `[first2, first2 + (last1 - first1)]`.

5 *Returns*:

```
GENERALIZED_SUM(binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...)
```

for every iterator `i` in `[first1, last1)`.

6 *Complexity*: $\mathcal{O}$(`last1 - first1`) applications each of `binary_op1` and `binary_op2`.

```
template<class InputIterator, class T,
         class BinaryOperation, class UnaryOperation>
  constexpr T transform_reduce(InputIterator first, InputIterator last, T init,
                               BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator, class T,
         class BinaryOperation, class UnaryOperation>
  T transform_reduce(ExecutionPolicy&& exec,
                     ForwardIterator first, ForwardIterator last,
                     T init, BinaryOperation binary_op, UnaryOperation unary_op);
```

7 *Mandates*: All of

(7.1) — `binary_op(init, init)`,

(7.2) — `binary_op(init, unary_op(*first))`, (7.3) — `binary_op(unary_op(*first), init)`, and

(7.4) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

8 *Preconditions*:

(8.1) — `T` meets the *Cpp17MoveConstructible* (Table 28) requirements.

(8.2) — Neither `unary_op` nor `binary_op` invalidates subranges, nor modifies elements in the range `[first, last]`.

9 *Returns*:

```
GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)
```

for every iterator `i` in `[first, last)`.

10 *Complexity*: $\mathscr{O}$(`last - first`) applications each of `unary_op` and `binary_op`.

11 [*Note 1*: `transform_reduce` does not apply `unary_op` to `init`. — *end note*]

25.10.7 Partial sum [partial.sum]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    partial_sum(InputIterator first, InputIterator last,
                OutputIterator result);
template<class InputIterator, class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    partial_sum(InputIterator first, InputIterator last,
                OutputIterator result, BinaryOperation binary_op);
```

1 *Mandates*: `InputIterator`'s value type is constructible from `*first`. The result of the expression `std::move(acc) + *i` or `binary_op(std::move(acc), *i)` is implicitly convertible to `InputIterator`'s value type. `acc` is writable (23.3.1) to `result`.

2 *Preconditions*: In the ranges `[first, last]` and `[result, result + (last - first)]` `binary_op` neither modifies elements nor invalidates iterators or subranges.[244]

3 *Effects*: For a non-empty range, the function creates an accumulator `acc` whose type is `InputIterator`'s value type, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last)` in order, `acc` is then modified by `acc = std::move(acc) + *i` or `acc = binary_op(std::move(acc), *i)` and the result is assigned to `*(result + (i - first))`.

4 *Returns*: `result + (last - first)`.

5 *Complexity*: Exactly `(last - first) - 1` applications of the binary operation.

6 *Remarks*: `result` may be equal to `first`.

25.10.8 Exclusive scan [exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T>
  constexpr OutputIterator
    exclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, T init);
```

1 *Effects*: Equivalent to:

```
return exclusive_scan(first, last, result, init, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
  ForwardIterator2
    exclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, T init);
```

2 *Effects*: Equivalent to:

```
return exclusive_scan(std::forward<ExecutionPolicy>(exec),
                      first, last, result, init, plus<>());
```

244) The use of fully closed ranges is intentional.

```
template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
  constexpr OutputIterator
    exclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, T init, BinaryOperation binary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
  ForwardIterator2
    exclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, T init, BinaryOperation binary_op);
```

3 *Mandates*: All of

(3.1) — `binary_op(init, init)`,

(3.2) — `binary_op(init, *first)`, and

(3.3) — `binary_op(*first, *first)`

are convertible to `T`.

4 *Preconditions*:

(4.1) — `T` meets the *Cpp17MoveConstructible* (Table 28) requirements.

(4.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

5 *Effects*: For each integer `K` in `[0, last - first)` assigns through `result + K` the value of:

```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1))
```

6 *Returns*: The end of the resulting range beginning at `result`.

7 *Complexity*: $\mathcal{O}$(`last - first`) applications of `binary_op`.

8 *Remarks*: `result` may be equal to `first`.

9 [*Note 1*: The difference between `exclusive_scan` and `inclusive_scan` is that `exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `exclusive_scan` might be nondeterministic. — *end note*]

25.10.9 Inclusive scan [inclusive.scan]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result);
```

1 *Effects*: Equivalent to:

```
return inclusive_scan(first, last, result, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result);
```

2 *Effects*: Equivalent to:

```
return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());
```

```
template<class InputIterator, class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
  ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, BinaryOperation binary_op);
```

```
template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
  constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, BinaryOperation binary_op, T init);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
  ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, BinaryOperation binary_op, T init);
```

3 Let `U` be the value type of `decltype(first)`.

4 *Mandates*: If `init` is provided, all of

(4.1) — `binary_op(init, init)`,

(4.2) — `binary_op(init, *first)`, and

(4.3) — `binary_op(*first, *first)`

are convertible to `T`; otherwise, `binary_op(*first, *first)` is convertible to `U`.

5 *Preconditions*:

(5.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* (Table 28) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.

(5.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

6 *Effects*: For each integer `K` in `[0, last - first)` assigns through `result + K` the value of

(6.1) — *`GENERALIZED_NONCOMMUTATIVE_SUM`*(
`binary_op, init, *(first + 0), *(first + 1), ..., *(first + K))`
if `init` is provided, or

(6.2) — *`GENERALIZED_NONCOMMUTATIVE_SUM`*(
`binary_op, *(first + 0), *(first + 1), ..., *(first + K))`
otherwise.

7 *Returns*: The end of the resulting range beginning at `result`.

8 *Complexity*: $\mathcal{O}$(`last - first`) applications of `binary_op`.

9 *Remarks*: `result` may be equal to `first`.

10 [*Note 1*: The difference between `exclusive_scan` and `inclusive_scan` is that `inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `inclusive_scan` might be nondeterministic. — *end note*]

25.10.10 Transform exclusive scan [transform.exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T,
         class BinaryOperation, class UnaryOperation>
  constexpr OutputIterator
    transform_exclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result, T init,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation, class UnaryOperation>
  ForwardIterator2
    transform_exclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result, T init,
                             BinaryOperation binary_op, UnaryOperation unary_op);
```

1 *Mandates*: All of

(1.1) — `binary_op(init, init)`,

(1.2) — `binary_op(init, unary_op(*first))`, and

(1.3) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

2 *Preconditions*:

(2.1) — `T` meets the *Cpp17MoveConstructible* (Table 28) requirements.

(2.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

3 *Effects*: For each integer `K` in `[0, last - first)` assigns through `result + K` the value of:

```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init,
    unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K - 1)))
```

4 *Returns*: The end of the resulting range beginning at `result`.

5 *Complexity*: $\mathcal{O}$(`last - first`) applications each of `unary_op` and `binary_op`.

6 *Remarks*: `result` may be equal to `first`.

7 [*Note 1*: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_exclusive_scan` might be nondeterministic. `transform_exclusive_scan` does not apply `unary_op` to `init`. — *end note*]

25.10.11 Transform inclusive scan [transform.inclusive.scan]

```
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation>
  constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation>
  ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation, class T>
  constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result,
                             BinaryOperation binary_op, UnaryOperation unary_op,
                             T init);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation, class T>
  ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result,
                             BinaryOperation binary_op, UnaryOperation unary_op,
                             T init);
```

1 Let `U` be the value type of `decltype(first)`.

2 *Mandates*: If `init` is provided, all of

(2.1) — `binary_op(init, init)`,

(2.2) — `binary_op(init, unary_op(*first))`, and

(2.3) — `binary_op(unary_op(*first), unary_op(*first))` are convertible to `T`; otherwise, `binary_op(unary_op(*first), unary_op(*first))` is convertible to `U`.

3 *Preconditions*:

(3.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* (Table 28) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.

(3.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

4 *Effects*: For each integer `K` in `[0, last - first)` assigns through `result + K` the value of

(4.1) —
```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init,
    unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K)))
```
if `init` is provided, or

(4.2) —
```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op,
    unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K)))
```
otherwise.

5 *Returns*: The end of the resulting range beginning at `result`.

6 *Complexity*: $\mathcal{O}$(`last - first`) applications each of `unary_op` and `binary_op`.

7 *Remarks*: `result` may be equal to `first`.

8 [*Note 1*: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_inclusive_scan` might be nondeterministic. `transform_inclusive_scan` does not apply `unary_op` to `init`. — *end note*]

25.10.12 Adjacent difference [adjacent.difference]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    adjacent_difference(InputIterator first, InputIterator last,
                        OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    adjacent_difference(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    adjacent_difference(InputIterator first, InputIterator last,
                        OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
  ForwardIterator2
    adjacent_difference(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result, BinaryOperation binary_op);
```

1 Let `T` be the value type of `decltype(first)`. For the overloads that do not take an argument `binary_op`, let `binary_op` be an lvalue that denotes an object of type `minus<>`.

2 *Mandates*:

(2.1) — For the overloads with no `ExecutionPolicy`, `T` is constructible from `*first`. `acc` (defined below) is writable (23.3.1) to the `result` output iterator. The result of the expression `binary_op(val, std::move(acc))` is writable to `result`.

(2.2) — For the overloads with an `ExecutionPolicy`, the result of the expressions `binary_op(*first, *first)` and `*first` are writable to `result`.

3 *Preconditions*:

(3.1) — For the overloads with no `ExecutionPolicy`, `T` meets the *Cpp17MoveAssignable* (Table 30) requirements.

(3.2) — For all overloads, in the ranges `[first, last]` and `[result, result + (last - first)]`, `binary_op` neither modifies elements nor invalidate iterators or subranges.[245]

4 *Effects*: For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an accumulator `acc` of type `T`, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last)` in order, creates an object `val` whose type is `T`, initializes it with `*i`, computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to `acc`.

5 For the overloads with an `ExecutionPolicy` and a non-empty range, performs `*result = *first`. Then, for every `d` in `[1, last - first - 1]`, performs `*(result + d) = binary_op(*(first + d), *(first + (d - 1)))`.

6 *Returns*: `result + (last - first)`.

7 *Complexity*: Exactly `(last - first) - 1` applications of the binary operation.

8 *Remarks*: For the overloads with no `ExecutionPolicy`, `result` may be equal to `first`. For the overloads with an `ExecutionPolicy`, the ranges `[first, last)` and `[result, result + (last - first))` shall not overlap.

25.10.13 Iota [numeric.iota]

```
template<class ForwardIterator, class T>
  constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

1 *Mandates*: `T` is convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has type `T`, is well-formed.

2 *Effects*: For each element referred to by the iterator `i` in the range `[first, last)`, assigns `*i = value` and increments `value` as if by `++value`.

3 *Complexity*: Exactly `last - first` increments and assignments.

25.10.14 Greatest common divisor [numeric.ops.gcd]

```
template<class M, class N>
  constexpr common_type_t<M,N> gcd(M m, N n);
```

1 *Mandates*: `M` and `N` both are integer types other than *cv* `bool`.

2 *Preconditions*: |`m`| and |`n`| are representable as a value of `common_type_t<M, N>`.

[*Note 1*: These requirements ensure, for example, that `gcd(m, m)` = |`m`| is representable as a value of type `M`. — *end note*]

3 *Returns*: Zero when `m` and `n` are both zero. Otherwise, returns the greatest common divisor of |`m`| and |`n`|.

4 *Throws*: Nothing.

25.10.15 Least common multiple [numeric.ops.lcm]

```
template<class M, class N>
  constexpr common_type_t<M,N> lcm(M m, N n);
```

1 *Mandates*: `M` and `N` both are integer types other than *cv* `bool`.

2 *Preconditions*: |`m`| and |`n`| are representable as a value of `common_type_t<M, N>`. The least common multiple of |`m`| and |`n`| is representable as a value of type `common_type_t<M,N>`.

3 *Returns*: Zero when either `m` or `n` is zero. Otherwise, returns the least common multiple of |`m`| and |`n`|.

4 *Throws*: Nothing.

245) The use of fully closed ranges is intentional.

25.10.16 Midpoint [numeric.ops.midpoint]

```
template<class T>
  constexpr T midpoint(T a, T b) noexcept;
```

1 *Constraints*: `T` is an arithmetic type other than `bool`.

2 *Returns*: Half the sum of `a` and `b`. If `T` is an integer type and the sum is odd, the result is rounded towards `a`.

3 *Remarks*: No overflow occurs. If `T` is a floating-point type, at most one inexact operation occurs.

```
template<class T>
  constexpr T* midpoint(T* a, T* b);
```

4 *Constraints*: `T` is an object type.

5 *Mandates*: `T` is a complete type.

6 *Preconditions*: `a` and `b` point to, respectively, elements i and j of the same array object `x`.

[*Note 1*: As specified in 6.8.3, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of n elements is considered to be equivalent to a pointer to a hypothetical array element n for this purpose. — *end note*]

7 *Returns*: A pointer to array element $i + \frac{j-i}{2}$ of `x`, where the result of the division is truncated towards zero.

25.11 Specialized `<memory>` algorithms [specialized.algorithms]

25.11.1 General [specialized.algorithms.general]

1 The contents specified in 25.11 are declared in the header `<memory>` (20.10.2).

2 Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement *new-expression* (7.6.2.8) are destroyed in an unspecified order before allowing the exception to propagate.

3 [*Note 1*: When invoked on ranges of potentially-overlapping subobjects (6.7.2), the algorithms specified in 25.11 result in undefined behavior. — *end note*]

4 Some algorithms specified in 25.11 make use of the exposition-only function *`voidify`*:

```
template<class T>
  constexpr void* voidify(T& obj) noexcept {
    return const_cast<void*>(static_cast<const volatile void*>(addressof(obj)));
  }
```

25.11.2 Special memory concepts [special.mem.concepts]

1 Some algorithms in this subclause are constrained with the following exposition-only concepts:

```
template<class I>
concept no-throw-input-iterator = // exposition only
  input_iterator<I> &&
  is_lvalue_reference_v<iter_reference_t<I>> &&
  same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>;
```

2 A type `I` models *`no-throw-input-iterator`* only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.

3 [*Note 1*: This concept allows some `input_iterator` (23.3.4.9) operations to throw exceptions. — *end note*]

```
template<class S, class I>
concept no-throw-sentinel-for = sentinel_for<S, I>; // exposition only
```

4 Types `S` and `I` model *`no-throw-sentinel-for`* only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type `I` and `S`.

5 [*Note 2*: This concept allows some `sentinel_for` (23.3.4.7) operations to throw exceptions. — *end note*]

```
template<class R>
concept no-throw-input-range = // exposition only
  range<R> &&
  no-throw-input-iterator<iterator_t<R>> &&
  no-throw-sentinel-for<sentinel_t<R>, iterator_t<R>>;
```

6 A type `R` models *`no-throw-input-range`* only if no exceptions are thrown from calls to `ranges::begin` and `ranges::end` on an object of type `R`.

```
template<class I>
concept no-throw-forward-iterator = // exposition only
  no-throw-input-iterator<I> &&
  forward_iterator<I> &&
  no-throw-sentinel-for<I, I>;
```

7 [*Note 3*: This concept allows some `forward_iterator` (23.3.4.11) operations to throw exceptions. — *end note*]

```
template<class R>
concept no-throw-forward-range = // exposition only
  no-throw-input-range<R> &&
  no-throw-forward-iterator<iterator_t<R>>;
```

25.11.3 uninitialized_default_construct [uninitialized.construct.default]

```
template<class NoThrowForwardIterator>
  void uninitialized_default_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

1 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type;
```

```
namespace ranges {
  template<no-throw-forward-iterator I, no-throw-sentinel-for<I> S>
      requires default_initializable<iter_value_t<I>>
    I uninitialized_default_construct(I first, S last);
  template<no-throw-forward-range R>
      requires default_initializable<range_value_t<R>>
    borrowed_iterator_t<R> uninitialized_default_construct(R&& r);
}
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
return first;
```

```
template<class NoThrowForwardIterator, class Size>
  NoThrowForwardIterator uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);
```

3 *Effects*: Equivalent to:

```
for (; n > 0; (void)++first, --n)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type;
return first;
```

```
namespace ranges {
  template<no-throw-forward-iterator I>
      requires default_initializable<iter_value_t<I>>
    I uninitialized_default_construct_n(I first, iter_difference_t<I> n);
}
```

4 *Effects*: Equivalent to:

```
return uninitialized_default_construct(counted_iterator(first, n),
                                       default_sentinel).base();
```

25.11.4 `uninitialized_value_construct` [uninitialized.construct.value]

```
template<class NoThrowForwardIterator>
  void uninitialized_value_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

1 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type();
```

```
namespace ranges {
  template<no-throw-forward-iterator I, no-throw-sentinel-for<I> S>
      requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct(I first, S last);
  template<no-throw-forward-range R>
      requires default_initializable<range_value_t<R>>
    borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
}
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>();
return first;
```

```
template<class NoThrowForwardIterator, class Size>
  NoThrowForwardIterator uninitialized_value_construct_n(NoThrowForwardIterator first, Size n);
```

3 *Effects*: Equivalent to:

```
for (; n > 0; (void)++first, --n)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type();
return first;
```

```
namespace ranges {
  template<no-throw-forward-iterator I>
      requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}
```

4 *Effects*: Equivalent to:

```
return uninitialized_value_construct(counted_iterator(first, n),
                                     default_sentinel).base();
```

25.11.5 `uninitialized_copy` [uninitialized.copy]

```
template<class InputIterator, class NoThrowForwardIterator>
  NoThrowForwardIterator uninitialized_copy(InputIterator first, InputIterator last,
                                            NoThrowForwardIterator result);
```

1 *Preconditions*: `result` + `[0, (last - first))` does not overlap with `[first, last)`.

2 *Effects*: Equivalent to:

```
for (; first != last; ++result, (void) ++first)
  ::new (voidify(*result))
    typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

3 *Returns*: `result`.

```
namespace ranges {
  template<input_iterator I, sentinel_for<I> S1,
           no-throw-forward-iterator O, no-throw-sentinel-for<O> S2>
      requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_result<I, O>
      uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
```

```
  template<input_range IR, no-throw-forward-range OR>
      requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
    uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
      uninitialized_copy(IR&& in_range, OR&& out_range);
}
```

4 *Preconditions*: `[ofirst, olast)` does not overlap with `[ifirst, ilast)`.

5 *Effects*: Equivalent to:

```
for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
  ::new (voidify(*ofirst)) remove_reference_t<iter_reference_t<O>>(*ifirst);
return {std::move(ifirst), ofirst};
```

```
template<class InputIterator, class Size, class NoThrowForwardIterator>
  NoThrowForwardIterator uninitialized_copy_n(InputIterator first, Size n,
                                              NoThrowForwardIterator result);
```

6 *Preconditions*: `result` + `[0, n)` does not overlap with `first` + `[0, n)`.

7 *Effects*: Equivalent to:

```
for ( ; n > 0; ++result, (void) ++first, --n)
  ::new (voidify(*result))
    typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

8 *Returns*: `result`.

```
namespace ranges {
  template<input_iterator I, no-throw-forward-iterator O, no-throw-sentinel-for<O> S>
      requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_n_result<I, O>
      uninitialized_copy_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
```

9 *Preconditions*: `[ofirst, olast)` does not overlap with `ifirst` + `[0, n)`.

10 *Effects*: Equivalent to:

```
auto t = uninitialized_copy(counted_iterator(ifirst, n),
                            default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};
```

25.11.6 `uninitialized_move` [uninitialized.move]

```
template<class InputIterator, class NoThrowForwardIterator>
  NoThrowForwardIterator uninitialized_move(InputIterator first, InputIterator last,
                                            NoThrowForwardIterator result);
```

1 *Preconditions*: `result` + `[0, (last - first))` does not overlap with `[first, last)`.

2 *Effects*: Equivalent to:

```
for (; first != last; (void)++result, ++first)
  ::new (voidify(*result))
    typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
return result;
```

```
namespace ranges {
  template<input_iterator I, sentinel_for<I> S1,
           no-throw-forward-iterator O, no-throw-sentinel-for<O> S2>
      requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
    uninitialized_move_result<I, O>
      uninitialized_move(I ifirst, S1 ilast, O ofirst, S2 olast);
  template<input_range IR, no-throw-forward-range OR>
      requires constructible_from<range_value_t<OR>, range_rvalue_reference_t<IR>>
    uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
      uninitialized_move(IR&& in_range, OR&& out_range);
}
```

3 *Preconditions*: `[ofirst, olast)` does not overlap with `[ifirst, ilast)`.

4 *Effects*: Equivalent to:

```
for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
  ::new (voidify(*ofirst))
    remove_reference_t<iter_reference_t<O>>(ranges::iter_move(ifirst));
return {std::move(ifirst), ofirst};
```

5 [*Note 1*: If an exception is thrown, some objects in the range `[first, last)` are left in a valid, but unspecified state. — *end note*]

```
template<class InputIterator, class Size, class NoThrowForwardIterator>
  pair<InputIterator, NoThrowForwardIterator>
    uninitialized_move_n(InputIterator first, Size n, NoThrowForwardIterator result);
```

6 *Preconditions*: `result` + `[0, n)` does not overlap with `first` + `[0, n)`.

7 *Effects*: Equivalent to:

```
for (; n > 0; ++result, (void) ++first, --n)
  ::new (voidify(*result))
    typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
return {first, result};
```

```
namespace ranges {
  template<input_iterator I, no-throw-forward-iterator O, no-throw-sentinel-for<O> S>
      requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
    uninitialized_move_n_result<I, O>
      uninitialized_move_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
```

8 *Preconditions*: `[ofirst, olast)` does not overlap with `ifirst` + `[0, n)`.

9 *Effects*: Equivalent to:

```
auto t = uninitialized_move(counted_iterator(ifirst, n),
                            default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};
```

10 [*Note 2*: If an exception is thrown, some objects in the range `first` + `[0, n)` are left in a valid but unspecified state. — *end note*]

25.11.7 `uninitialized_fill` [uninitialized.fill]

```
template<class NoThrowForwardIterator, class T>
  void uninitialized_fill(NoThrowForwardIterator first, NoThrowForwardIterator last, const T& x);
```

1 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type(x);
```

```
namespace ranges {
  template<no-throw-forward-iterator I, no-throw-sentinel-for<I> S, class T>
      requires constructible_from<iter_value_t<I>, const T&>
    I uninitialized_fill(I first, S last, const T& x);
  template<no-throw-forward-range R, class T>
      requires constructible_from<range_value_t<R>, const T&>
    borrowed_iterator_t<R> uninitialized_fill(R&& r, const T& x);
}
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>(x);
return first;
```

```
template<class NoThrowForwardIterator, class Size, class T>
  NoThrowForwardIterator uninitialized_fill_n(NoThrowForwardIterator first, Size n, const T& x);
```

3 *Effects*: Equivalent to:

```
for (; n--; ++first)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type(x);
```

```
return first;
```

```
namespace ranges {
  template<no-throw-forward-iterator I, class T>
      requires constructible_from<iter_value_t<I>, const T&>
    I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
}
```

4 *Effects*: Equivalent to:

```
return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();
```

25.11.8 `construct_at` [specialized.construct]

```
template<class T, class... Args>
  constexpr T* construct_at(T* location, Args&&... args);

namespace ranges {
  template<class T, class... Args>
    constexpr T* construct_at(T* location, Args&&... args);
}
```

1 *Constraints*: The expression `::new (declval<void*>()) T(declval<Args>()...)` is well-formed when treated as an unevaluated operand.

2 *Effects*: Equivalent to:

```
return ::new (voidify(*location)) T(std::forward<Args>(args)...);
```

25.11.9 `destroy` [specialized.destroy]

```
template<class T>
  constexpr void destroy_at(T* location);
namespace ranges {
  template<destructible T>
    constexpr void destroy_at(T* location) noexcept;
}
```

1 *Effects*:

(1.1) — If `T` is an array type, equivalent to `destroy(begin(*location), end(*location))`.

(1.2) — Otherwise, equivalent to `location->~T()`.

```
template<class NoThrowForwardIterator>
  constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  destroy_at(addressof(*first));
```

```
namespace ranges {
  template<no-throw-input-iterator I, no-throw-sentinel-for<I> S>
      requires destructible<iter_value_t<I>>
    constexpr I destroy(I first, S last) noexcept;
  template<no-throw-input-range R>
      requires destructible<range_value_t<R>>
    constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}
```

3 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  destroy_at(addressof(*first));
return first;
```

```
template<class NoThrowForwardIterator, class Size>
  constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);
```

4 *Effects*: Equivalent to:

```
    for (; n > 0; (void)++first, --n)
      destroy_at(addressof(*first));
    return first;
```

```
namespace ranges {
  template<no-throw-input-iterator I>
      requires destructible<iter_value_t<I>>
    constexpr I destroy_n(I first, iter_difference_t<I> n) noexcept;
}
```

5 *Effects*: Equivalent to:

```
return destroy(counted_iterator(first, n), default_sentinel).base();
```

25.12 C library algorithms [alg.c.library]

1 [*Note 1*: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — *end note*]

```
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
              c-compare-pred* compar);
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
              compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, c-compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);
```

2 *Preconditions*: The objects in the array pointed to by `base` are of trivial type.

3 *Effects*: These functions have the semantics specified in the C standard library.

4 *Throws*: Any exception thrown by `compar` (16.4.6.13).

SEE ALSO: ISO C 7.22.5.

26 Numerics library [numerics]

26.1 General [numerics.general]

1 This Clause describes components that C++ programs may use to perform seminumerical operations.

2 The following subclauses describe components for complex number types, random number generation, numeric (n-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in Table 92.

Table 92: Numerics library summary [tab:numerics.summary]

	Subclause	Header
26.2	Requirements	
26.3	Floating-point environment	`<cfenv>`
26.4	Complex numbers	`<complex>`
26.5	Bit manipulation	`<bit>`
26.6	Random number generation	`<random>`
26.7	Numeric arrays	`<valarray>`
26.8	Mathematical functions for floating-point types	`<cmath>`, `<cstdlib>`
26.9	Numbers	`<numbers>`

26.2 Numeric type requirements [numeric.requirements]

1 The `complex` and `valarray` components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A *numeric type* is a cv-unqualified object type `T` that meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17Destructible* requirements (16.4.4.2).[246]

2 If any operation on `T` throws an exception the effects are undefined.

3 In addition, many member and related functions of `valarray<T>` can be successfully instantiated and will exhibit well-defined behavior if and only if `T` meets additional requirements specified for each such member or related function.

4 [*Example 1*: It is valid to instantiate `valarray<complex>`, but `operator>()` will not be successfully instantiated for `valarray<complex>` operands, since `complex` does not have any ordering operators. — *end example*]

26.3 The floating-point environment [cfenv]

26.3.1 Header `<cfenv>` synopsis [cfenv.syn]

```
#define FE_ALL_EXCEPT see below

#define FE_UPWARD see below         // optional

#define FE_DFL_ENV see below
```

246) In other words, value types. These include arithmetic types, pointers, the library class `complex`, and instantiations of `valarray` for value types.

```
namespace std {
  // types
  using fenv_t    = object type;
  using fexcept_t = integer type;

  // functions
  int feclearexcept(int except);
  int fegetexceptflag(fexcept_t* pflag, int except);
  int feraiseexcept(int except);
  int fesetexceptflag(const fexcept_t* pflag, int except);
  int fetestexcept(int except);

  int fegetround();
  int fesetround(int mode);

  int fegetenv(fenv_t* penv);
  int feholdexcept(fenv_t* penv);
  int fesetenv(const fenv_t* penv);
  int feupdateenv(const fenv_t* penv);
}
```

1 The contents and meaning of the header `<cfenv>` are the same as the C standard library header `<fenv.h>`.

[*Note 1*: This document does not require an implementation to support the `FENV_ACCESS` pragma; it is implementation-defined (15.9) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. — *end note*]

SEE ALSO: ISO C 7.6

26.3.2 Threads [cfenv.thread]

1 The floating-point environment has thread storage duration (6.7.5.3). The initial state for a thread's floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding `thread` object (32.4.3) or `jthread` object (32.4.4) at the time it constructed the object.

[*Note 1*: That is, the child thread gets the floating-point state of the parent thread at the time of the child's creation. — *end note*]

2 A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

26.4 Complex numbers [complex.numbers]

26.4.1 General [complex.numbers.general]

1 The header `<complex>` defines a class template, and numerous functions for representing and manipulating complex numbers.

2 The effect of instantiating the template `complex` for any type other than `float`, `double`, or `long double` is unspecified. The specializations `complex<float>`, `complex<double>`, and `complex<long double>` are literal types (6.8).

3 If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

4 If `z` is an lvalue of type *cv* `complex<T>` then:

(4.1) — the expression `reinterpret_cast<`*cv* `T(&)[2]>(z)` is well-formed,

(4.2) — `reinterpret_cast<`*cv* `T(&)[2]>(z)[0]` designates the real part of `z`, and

(4.3) — `reinterpret_cast<`*cv* `T(&)[2]>(z)[1]` designates the imaginary part of `z`.

Moreover, if `a` is an expression of type *cv* `complex<T>*` and the expression `a[i]` is well-defined for an integer expression `i`, then:

(4.4) — `reinterpret_cast<`*cv* `T*>(a)[2*i]` designates the real part of `a[i]`, and

(4.5) — `reinterpret_cast<`*cv* `T*>(a)[2*i + 1]` designates the imaginary part of `a[i]`.

26.4.2 Header <complex> synopsis [complex.syn]

```
namespace std {
  // 26.4.3, class template complex
  template<class T> class complex;

      constexpr complex<long double> operator""il(unsigned long long);
      constexpr complex<double> operator""i(long double);
      constexpr complex<double> operator""i(unsigned long long);
      constexpr complex<float> operator""if(long double);
      constexpr complex<float> operator""if(unsigned long long);
    }
    }
  }
```

26.4.3 Class template `complex` [complex]

```
namespace std {
  template<class T> class complex {
  public:
    using value_type = T;

    constexpr complex(const T& re = T(), const T& im = T());
    constexpr complex(const complex&);
    template<class X> constexpr complex(const complex<X>&);

    constexpr T real() const;
    constexpr void real(T);
    constexpr T imag() const;
    constexpr void imag(T);

    constexpr complex& operator= (const T&);
    constexpr complex& operator+=(const T&);
    constexpr complex& operator-=(const T&);
    constexpr complex& operator*=(const T&);
    constexpr complex& operator/=(const T&);

    constexpr complex& operator=(const complex&);
    template<class X> constexpr complex& operator= (const complex<X>&);
    template<class X> constexpr complex& operator+=(const complex<X>&);
    template<class X> constexpr complex& operator-=(const complex<X>&);
    template<class X> constexpr complex& operator*=(const complex<X>&);
    template<class X> constexpr complex& operator/=(const complex<X>&);
  };
}
```

1 The class `complex` describes an object that can store the Cartesian components, `real()` and `imag()`, of a complex number.

26.4.4 Specializations [complex.special]

```
namespace std {
  template<> class complex<float> {
  public:
    using value_type = float;
```

```
    constexpr complex(float re = 0.0f, float im = 0.0f);
    constexpr complex(const complex<float>&) = default;
    constexpr explicit complex(const complex<double>&);
    constexpr explicit complex(const complex<long double>&);

    constexpr float real() const;
    constexpr void real(float);
    constexpr float imag() const;
    constexpr void imag(float);

    constexpr complex& operator= (float);
    constexpr complex& operator+=(float);
    constexpr complex& operator-=(float);
    constexpr complex& operator*=(float);
    constexpr complex& operator/=(float);

    constexpr complex& operator=(const complex&);
    template<class X> constexpr complex& operator= (const complex<X>&);
    template<class X> constexpr complex& operator+=(const complex<X>&);
    template<class X> constexpr complex& operator-=(const complex<X>&);
    template<class X> constexpr complex& operator*=(const complex<X>&);
    template<class X> constexpr complex& operator/=(const complex<X>&);
  };

  template<> class complex<double> {
  public:
    using value_type = double;

    constexpr complex(double re = 0.0, double im = 0.0);
    constexpr complex(const complex<float>&);
    constexpr complex(const complex<double>&) = default;
    constexpr explicit complex(const complex<long double>&);

    constexpr double real() const;
    constexpr void real(double);
    constexpr double imag() const;
    constexpr void imag(double);

    constexpr complex& operator= (double);
    constexpr complex& operator+=(double);
    constexpr complex& operator-=(double);
    constexpr complex& operator*=(double);
    constexpr complex& operator/=(double);

    constexpr complex& operator=(const complex&);
    template<class X> constexpr complex& operator= (const complex<X>&);
    template<class X> constexpr complex& operator+=(const complex<X>&);
    template<class X> constexpr complex& operator-=(const complex<X>&);
    template<class X> constexpr complex& operator*=(const complex<X>&);
    template<class X> constexpr complex& operator/=(const complex<X>&);
  };

  template<> class complex<long double> {
  public:
    using value_type = long double;

    constexpr complex(long double re = 0.0L, long double im = 0.0L);
    constexpr complex(const complex<float>&);
    constexpr complex(const complex<double>&);
    constexpr complex(const complex<long double>&) = default;

    constexpr long double real() const;
    constexpr void real(long double);
    constexpr long double imag() const;
```

```
    constexpr void imag(long double);

    constexpr complex& operator= (long double);
    constexpr complex& operator+=(long double);
    constexpr complex& operator-=(long double);
    constexpr complex& operator*=(long double);
    constexpr complex& operator/=(long double);

    constexpr complex& operator=(const complex&);
    template<class X> constexpr complex& operator= (const complex<X>&);
    template<class X> constexpr complex& operator+=(const complex<X>&);
    template<class X> constexpr complex& operator-=(const complex<X>&);
    template<class X> constexpr complex& operator*=(const complex<X>&);
    template<class X> constexpr complex& operator/=(const complex<X>&);
  };
}
```

26.4.5 Member functions [complex.members]

`template<class T> constexpr complex(const T& re = T(), const T& im = T());`

1 *Postconditions*: `real() == re && imag() == im` is `true`.

`constexpr T real() const;`

2 *Returns*: The value of the real component.

`constexpr void real(T val);`

3 *Effects*: Assigns `val` to the real component.

`constexpr T imag() const;`

4 *Returns*: The value of the imaginary component.

`constexpr void imag(T val);`

5 *Effects*: Assigns `val` to the imaginary component.

26.4.6 Member operators [complex.member.ops]

`constexpr complex& operator+=(const T& rhs);`

1 *Effects*: Adds the scalar value `rhs` to the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

2 *Returns*: `*this`.

`constexpr complex& operator-=(const T& rhs);`

3 *Effects*: Subtracts the scalar value `rhs` from the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

4 *Returns*: `*this`.

`constexpr complex& operator*=(const T& rhs);`

5 *Effects*: Multiplies the scalar value `rhs` by the complex value `*this` and stores the result in `*this`.

6 *Returns*: `*this`.

`constexpr complex& operator/=(const T& rhs);`

7 *Effects*: Divides the scalar value `rhs` into the complex value `*this` and stores the result in `*this`.

8 *Returns*: `*this`.

`template<class X> constexpr complex& operator+=(const complex<X>& rhs);`

9 *Effects*: Adds the complex value `rhs` to the complex value `*this` and stores the sum in `*this`.

10 *Returns*: `*this`.

```
template<class X> constexpr complex& operator-=(const complex<X>& rhs);
```

11 *Effects*: Subtracts the complex value `rhs` from the complex value `*this` and stores the difference in `*this`.

12 *Returns*: `*this`.

```
template<class X> constexpr complex& operator*=(const complex<X>& rhs);
```

13 *Effects*: Multiplies the complex value `rhs` by the complex value `*this` and stores the product in `*this`.

14 *Returns*: `*this`.

```
template<class X> constexpr complex& operator/=(const complex<X>& rhs);
```

15 *Effects*: Divides the complex value `rhs` into the complex value `*this` and stores the quotient in `*this`.

16 *Returns*: `*this`.

26.4.7 Non-member operations [complex.ops]

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs);
```

1 *Returns*: `complex<T>(lhs)`.

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);
```

2 *Returns*: `complex<T>(lhs) += rhs`.

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs);
```

3 *Returns*: `complex<T>(-lhs.real(),-lhs.imag())`.

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);
```

4 *Returns*: `complex<T>(lhs) -= rhs`.

```
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);
```

5 *Returns*: `complex<T>(lhs) *= rhs`.

```
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator/(const T& lhs, const complex<T>& rhs);
```

6 *Returns*: `complex<T>(lhs) /= rhs`.

```
template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);
```

7 *Returns*: `lhs.real() == rhs.real() && lhs.imag() == rhs.imag()`.

8 *Remarks*: The imaginary part is assumed to be `T()`, or 0.0, for the `T` arguments.

```
template<class T, class charT, class traits>
  basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);
```

9 *Preconditions*: The input values are convertible to `T`.

10 *Effects*: Extracts a complex number `x` of the form: `u`, `(u)`, or `(u,v)`, where `u` is the real part and `v` is the imaginary part (29.7.4.3).

11 If bad input is encountered, calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (29.5.5.4)).

12 *Returns*: `is`.

13 *Remarks*: This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

```
template<class T, class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);
```

14 *Effects*: Inserts the complex number `x` onto the stream `o` as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(o.flags());
s.imbue(o.getloc());
s.precision(o.precision());
s << '(' << x.real() << "," << x.imag() << ')';
return o << s.str();
```

15 [*Note 1*: In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting `showpoint` into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously. — *end note*]

26.4.8 Value operations [complex.value.ops]

```
template<class T> constexpr T real(const complex<T>& x);
```

1 *Returns*: `x.real()`.

```
template<class T> constexpr T imag(const complex<T>& x);
```

2 *Returns*: `x.imag()`.

```
template<class T> T abs(const complex<T>& x);
```

3 *Returns*: The magnitude of `x`.

```
template<class T> T arg(const complex<T>& x);
```

4 *Returns*: The phase angle of `x`, or `atan2(imag(x), real(x))`.

```
template<class T> constexpr T norm(const complex<T>& x);
```

5 *Returns*: The squared magnitude of `x`.

```
template<class T> constexpr complex<T> conj(const complex<T>& x);
```

6 *Returns*: The complex conjugate of `x`.

```
template<class T> complex<T> proj(const complex<T>& x);
```

7 *Returns*: The projection of `x` onto the Riemann sphere.

8 *Remarks*: Behaves the same as the C function `cproj`. SEE ALSO: ISO C 7.3.9.5

```
template<class T> complex<T> polar(const T& rho, const T& theta = T());
```

9 *Preconditions*: `rho` is non-negative and non-NaN. `theta` is finite.

10 *Returns*: The `complex` value corresponding to a complex number whose magnitude is `rho` and whose phase angle is `theta`.

26.4.9 Transcendentals [complex.transcendentals]

```
template<class T> complex<T> acos(const complex<T>& x);
```

1 *Returns*: The complex arc cosine of `x`.

2 *Remarks*: Behaves the same as the C function `cacos`. SEE ALSO: ISO C 7.3.5.1

```
template<class T> complex<T> asin(const complex<T>& x);
```

3 *Returns*: The complex arc sine of `x`.

4 *Remarks*: Behaves the same as the C function `casin`. SEE ALSO: ISO C 7.3.5.2

```
template<class T> complex<T> atan(const complex<T>& x);
```

5 *Returns*: The complex arc tangent of `x`.

6 *Remarks*: Behaves the same as the C function `catan`. SEE ALSO: ISO C 7.3.5.3

```
template<class T> complex<T> acosh(const complex<T>& x);
```

7 *Returns*: The complex arc hyperbolic cosine of `x`.

8 *Remarks*: Behaves the same as the C function `cacosh`. SEE ALSO: ISO C 7.3.6.1

```
template<class T> complex<T> asinh(const complex<T>& x);
```

9 *Returns*: The complex arc hyperbolic sine of `x`.

10 *Remarks*: Behaves the same as the C function `casinh`. SEE ALSO: ISO C 7.3.6.2

```
template<class T> complex<T> atanh(const complex<T>& x);
```

11 *Returns*: The complex arc hyperbolic tangent of `x`.

12 *Remarks*: Behaves the same as the C function `catanh`. SEE ALSO: ISO C 7.3.6.3

```
template<class T> complex<T> cos(const complex<T>& x);
```

13 *Returns*: The complex cosine of `x`.

```
template<class T> complex<T> cosh(const complex<T>& x);
```

14 *Returns*: The complex hyperbolic cosine of `x`.

```
template<class T> complex<T> exp(const complex<T>& x);
```

15 *Returns*: The complex base-e exponential of `x`.

```
template<class T> complex<T> log(const complex<T>& x);
```

16 *Returns*: The complex natural (base-e) logarithm of `x`. For all `x`, `imag(log(x))` lies in the interval `[`$-\pi$`, `π`]`.

[*Note 1*: The semantics of this function are intended to be the same in C++ as they are for `clog` in C. — *end note*]

17 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> complex<T> log10(const complex<T>& x);
```

18 *Returns*: The complex common (base-10) logarithm of `x`, defined as `log(x) / log(10)`.

19 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);
template<class T> complex<T> pow(const complex<T>& x, const T& y);
template<class T> complex<T> pow(const T& x, const complex<T>& y);
```

20 *Returns*: The complex power of base `x` raised to the $\mathtt{y}^{\text{th}}$ power, defined as `exp(y * log(x))`. The value returned for `pow(0, 0)` is implementation-defined.

21 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> complex<T> sin(const complex<T>& x);
```

22 *Returns*: The complex sine of `x`.

```
template<class T> complex<T> sinh(const complex<T>& x);
```

23 *Returns*: The complex hyperbolic sine of `x`.

```
template<class T> complex<T> sqrt(const complex<T>& x);
```

24 *Returns*: The complex square root of `x`, in the range of the right half-plane.

[*Note 2*: The semantics of this function are intended to be the same in C++ as they are for `csqrt` in C. — *end note*]

25 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> complex<T> tan(const complex<T>& x);
```

26 *Returns*: The complex tangent of `x`.

```
template<class T> complex<T> tanh(const complex<T>& x);
```

27 *Returns*: The complex hyperbolic tangent of `x`.

26.4.10 Additional overloads [cmplx.over]

1 The following function templates shall have additional overloads:

```
arg                    norm
conj                   proj
imag                   real
```

where `norm`, `conj`, `imag`, and `real` are `constexpr` overloads.

2 The additional overloads shall be sufficient to ensure:

(2.1) — If the argument has type `long double`, then it is effectively cast to `complex<long double>`.

(2.2) — Otherwise, if the argument has type `double` or an integer type, then it is effectively cast to `complex<double>`.

(2.3) — Otherwise, if the argument has type `float`, then it is effectively cast to `complex<float>`.

3 Function template `pow` shall have additional overloads sufficient to ensure, for a call with at least one argument of type `complex<T>`:

(3.1) — If either argument has type `complex<long double>` or type `long double`, then both arguments are effectively cast to `complex<long double>`.

(3.2) — Otherwise, if either argument has type `complex<double>`, `double`, or an integer type, then both arguments are effectively cast to `complex<double>`.

(3.3) — Otherwise, if either argument has type `complex<float>` or `float`, then both arguments are effectively cast to `complex<float>`.

26.4.11 Suffixes for complex number literals [complex.literals]

1 This subclause describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```
constexpr complex<long double> operator""il(long double d);
constexpr complex<long double> operator""il(unsigned long long d);
```

2 *Returns*: `complex<long double>{0.0L, static_cast<long double>(d)}`.

```
constexpr complex<double> operator""i(long double d);
constexpr complex<double> operator""i(unsigned long long d);
```

3 *Returns*: `complex<double>{0.0, static_cast<double>(d)}`.

```
constexpr complex<float> operator""if(long double d);
constexpr complex<float> operator""if(unsigned long long d);
```

4 *Returns*: `complex<float>{0.0f, static_cast<float>(d)}`.

26.5 Bit manipulation [bit]

26.5.1 General [bit.general]

1 The header `<bit>` provides components to access, manipulate and process both individual bits and bit sequences.

26.5.2 Header `<bit>` synopsis [bit.syn]

```
namespace std {
  // 26.5.3, bit_cast
  template<class To, class From>
    constexpr To bit_cast(const From& from) noexcept;

  // 26.5.4, integral powers of 2
  template<class T>
    constexpr bool has_single_bit(T x) noexcept;
  template<class T>
    constexpr T bit_ceil(T x);
  template<class T>
    constexpr T bit_floor(T x) noexcept;
```

```
  template<class T>
    constexpr T bit_width(T x) noexcept;

  // 26.5.5, rotating
  template<class T>
    [[nodiscard]] constexpr T rotl(T x, int s) noexcept;
  template<class T>
    [[nodiscard]] constexpr T rotr(T x, int s) noexcept;

  // 26.5.6, counting
  template<class T>
    constexpr int countl_zero(T x) noexcept;
  template<class T>
    constexpr int countl_one(T x) noexcept;
  template<class T>
    constexpr int countr_zero(T x) noexcept;
  template<class T>
    constexpr int countr_one(T x) noexcept;
  template<class T>
    constexpr int popcount(T x) noexcept;

  // 26.5.7, endian
  enum class endian {
    little = see below,
    big    = see below,
    native = see below
  };
}
```

26.5.3 Function template bit_cast [bit.cast]

```
template<class To, class From>
  constexpr To bit_cast(const From& from) noexcept;
```

1 *Constraints*:

(1.1) — `sizeof(To) == sizeof(From)` is `true`;

(1.2) — `is_trivially_copyable_v<To>` is `true`; and

(1.3) — `is_trivially_copyable_v<From>` is `true`.

2 *Returns*: An object of type `To`. Implicitly creates objects nested within the result (6.7.2). Each bit of the value representation of the result is equal to the corresponding bit in the object representation of `from`. Padding bits of the result are unspecified. For the result and each object created within it, if there is no value of the object's type corresponding to the value representation produced, the behavior is undefined. If there are multiple such values, which value is produced is unspecified.

3 *Remarks*: This function is `constexpr` if and only if `To`, `From`, and the types of all subobjects of `To` and `From` are types `T` such that:

(3.1) — `is_union_v<T>` is `false`;

(3.2) — `is_pointer_v<T>` is `false`;

(3.3) — `is_member_pointer_v<T>` is `false`;

(3.4) — `is_volatile_v<T>` is `false`; and

(3.5) — `T` has no non-static data members of reference type.

26.5.4 Integral powers of 2 [bit.pow.two]

```
template<class T>
  constexpr bool has_single_bit(T x) noexcept;
```

1 *Constraints*: `T` is an unsigned integer type (6.8.2).

2 *Returns*: `true` if `x` is an integral power of two; `false` otherwise.

```
template<class T>
  constexpr T bit_ceil(T x);
```

3 Let N be the smallest power of 2 greater than or equal to `x`.

4 *Constraints*: `T` is an unsigned integer type (6.8.2).

5 *Preconditions*: N is representable as a value of type `T`.

6 *Returns*: N.

7 *Throws*: Nothing.

8 *Remarks*: A function call expression that violates the precondition in the *Preconditions*: element is not a core constant expression (7.7).

```
template<class T>
  constexpr T bit_floor(T x) noexcept;
```

9 *Constraints*: `T` is an unsigned integer type (6.8.2).

10 *Returns*: If `x == 0`, `0`; otherwise the maximal value `y` such that `has_single_bit(y)` is `true` and `y <= x`.

```
template<class T>
  constexpr T bit_width(T x) noexcept;
```

11 *Constraints*: `T` is an unsigned integer type (6.8.2).

12 *Returns*: If `x == 0`, `0`; otherwise one plus the base-2 logarithm of `x`, with any fractional part discarded.

26.5.5 Rotating [bit.rotate]

1 In the following descriptions, let `N` denote `numeric_limits<T>::digits`.

```
template<class T>
  [[nodiscard]] constexpr T rotl(T x, int s) noexcept;
```

2 *Constraints*: `T` is an unsigned integer type (6.8.2).

3 Let `r` be `s % N`.

4 *Returns*: If `r` is `0`, `x`; if `r` is positive, `(x << r) | (x >> (N - r))`; if `r` is negative, `rotr(x, -r)`.

```
template<class T>
  [[nodiscard]] constexpr T rotr(T x, int s) noexcept;
```

5 *Constraints*: `T` is an unsigned integer type (6.8.2).

6 Let `r` be `s % N`.

7 *Returns*: If `r` is `0`, `x`; if `r` is positive, `(x >> r) | (x << (N - r))`; if `r` is negative, `rotl(x, -r)`.

26.5.6 Counting [bit.count]

In the following descriptions, let `N` denote `numeric_limits<T>::digits`.

```
template<class T>
  constexpr int countl_zero(T x) noexcept;
```

1 *Constraints*: `T` is an unsigned integer type (6.8.2).

2 *Returns*: The number of consecutive `0` bits in the value of `x`, starting from the most significant bit.

[*Note 1*: Returns `N` if `x == 0`. — *end note*]

```
template<class T>
  constexpr int countl_one(T x) noexcept;
```

3 *Constraints*: `T` is an unsigned integer type (6.8.2).

4 *Returns*: The number of consecutive `1` bits in the value of `x`, starting from the most significant bit.

[*Note 2*: Returns `N` if `x == numeric_limits<T>::max()`. — *end note*]

```
template<class T>
  constexpr int countr_zero(T x) noexcept;
```

5 *Constraints*: `T` is an unsigned integer type (6.8.2).

6 *Returns*: The number of consecutive `0` bits in the value of `x`, starting from the least significant bit.

[*Note 3*: Returns `N` if `x == 0`. — *end note*]

```
template<class T>
  constexpr int countr_one(T x) noexcept;
```

7 *Constraints*: `T` is an unsigned integer type (6.8.2).

8 *Returns*: The number of consecutive `1` bits in the value of `x`, starting from the least significant bit.

[*Note 4*: Returns `N` if `x == numeric_limits<T>::max()`. — *end note*]

```
template<class T>
  constexpr int popcount(T x) noexcept;
```

9 *Constraints*: `T` is an unsigned integer type (6.8.2).

10 *Returns*: The number of `1` bits in the value of `x`.

26.5.7 Endian [bit.endian]

1 Two common methods of byte ordering in multibyte scalar types are big-endian and little-endian in the execution environment. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage of binary data in which the least significant byte is placed first, with the rest in ascending order. This subclause describes the endianness of the scalar types of the execution environment.

```
enum class endian {
  little = see below,
  big    = see below,
  native = see below
};
```

2 If all scalar types have size 1 byte, then all of `endian::little`, `endian::big`, and `endian::native` have the same value. Otherwise, `endian::little` is not equal to `endian::big`. If all scalar types are big-endian, `endian::native` is equal to `endian::big`. If all scalar types are little-endian, `endian::native` is equal to `endian::little`. Otherwise, `endian::native` is not equal to either `endian::big` or `endian::little`.

26.6 Random number generation [rand]

26.6.1 General [rand.general]

1 Subclause 26.6 defines a facility for generating (pseudo-)random numbers.

2 In addition to a few utilities, four categories of entities are described: *uniform random bit generators*, *random number engines*, *random number engine adaptors*, and *random number distributions*. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated.

[*Note 1*: These entities are specified in such a way as to permit the binding of any uniform random bit generator object `e` as the argument to any random number distribution object `d`, thus producing a zero-argument function object such as given by `bind(d,e)`. — *end note*]

3 Each of the entities specified in 26.6 has an associated arithmetic type (6.8.2) identified as `result_type`. With `T` as the `result_type` thus associated with such an entity, that entity is characterized:

(3.1) — as *boolean* or equivalently as *boolean-valued*, if `T` is `bool`;

(3.2) — otherwise as *integral* or equivalently as *integer-valued*, if `numeric_limits<T>::is_integer` is `true`;

(3.3) — otherwise as *floating-point* or equivalently as *real-valued*.

If integer-valued, an entity may optionally be further characterized as *signed* or *unsigned*, according to `numeric_limits<T>::is_signed`.

4 Unless otherwise specified, all descriptions of calculations in 26.6 use mathematical real numbers.

5 Throughout 26.6, the operators `bitand`, `bitor`, and `xor` denote the respective conventional bitwise operations. Further:

(5.1) — the operator `rshift` denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and

(5.2) — the operator lshift_w denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo 2^w.

26.6.2 Header <random> synopsis [rand.synopsis]

```
#include <initializer_list>

namespace std {
  // 26.6.3.3, uniform random bit generator requirements

}
```

26.6.3 Requirements [rand.req]

26.6.3.1 General requirements [rand.req.genl]

1 Throughout this subclause 26.6, the effect of instantiating a template:

(1.1) — that has a template type parameter named `Sseq` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of seed sequence (26.6.3.2).

(1.2) — that has a template type parameter named `URBG` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of uniform random bit generator (26.6.3.3).

(1.3) — that has a template type parameter named `Engine` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of random number engine (26.6.3.4).

(1.4) — that has a template type parameter named `RealType` is undefined unless the corresponding template argument is cv-unqualified and is one of `float`, `double`, or `long double`.

(1.5) — that has a template type parameter named `IntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `short`, `int`, `long`, `long long`, `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.

(1.6) — that has a template type parameter named `UIntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.

2 Throughout this subclause 26.6, phrases of the form "`x` is an iterator of a specific kind" shall be interpreted as equivalent to the more formal requirement that "`x` is a value of a type meeting the requirements of the specified iterator type".

3 Throughout this subclause 26.6, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared `explicit`.

26.6.3.2 Seed sequence requirements [rand.req.seedseq]

1 A *seed sequence* is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values i, $0 \leq i < 2^{32}$, based on the consumed data.

[*Note 1*: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. — *end note*]

2 A class `S` meets the requirements of a seed sequence if the expressions shown in Table 93 are valid and have the indicated semantics, and if `S` also meets all other requirements of this subclause 26.6.3.2. In that Table and throughout this subclause:

(2.1) — `T` is the type named by `S`'s associated `result_type`;

(2.2) — `q` is a value of `S` and `r` is a possibly const value of `S`;

(2.3) — `ib` and `ie` are input iterators with an unsigned integer `value_type` of at least 32 bits;

(2.4) — `rb` and `re` are mutable random access iterators with an unsigned integer `value_type` of at least 32 bits;

(2.5) — `ob` is an output iterator; and

(2.6) — `il` is a value of `initializer_list<T>`.

Table 93: Seed sequence requirements [tab:rand.req.seedseq]

Expression	Return type	Pre/post-condition	Complexity
`S::result_type`	`T`	`T` is an unsigned integer type (6.8.2) of at least 32 bits.	compile-time
`S()`		Creates a seed sequence with the same initial state as all other default-constructed seed sequences of type `S`.	constant
`S(ib,ie)`		Creates a seed sequence having internal state that depends on some or all of the bits of the supplied sequence [`ib`, `ie`).	$\mathcal{O}$(`ie` − `ib`)
`S(il)`		Same as `S(il.begin(), il.end())`.	same as `S(il.begin(), il.end())`
`q.generate(rb,re)`	`void`	Does nothing if `rb == re`. Otherwise, fills the supplied sequence [`rb`, `re`) with 32-bit quantities that depend on the sequence supplied to the constructor and possibly also depend on the history of `generate`'s previous invocations.	$\mathcal{O}$(`re` − `rb`)
`r.size()`	`size_t`	The number of 32-bit units that would be copied by a call to `r.param`.	constant
`r.param(ob)`	`void`	Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of type `S`, and that would reproduce in that second object a state indistinguishable from the state of the first object.	$\mathcal{O}$(`r.size()`)

26.6.3.3 Uniform random bit generator requirements [rand.req.urng]

1 A *uniform random bit generator* `g` of type `G` is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned.

[*Note 1*: The degree to which `g`'s results approximate the ideal is often determined statistically. — *end note*]

```
template<class G>
  concept uniform_random_bit_generator =
    invocable<G&> && unsigned_integral<invoke_result_t<G&>> &&
    requires {
      { G::min() } -> same_as<invoke_result_t<G&>>;
      { G::max() } -> same_as<invoke_result_t<G&>>;
      requires bool_constant<(G::min() < G::max())>::value;
    };
```

2 Let `g` be an object of type `G`. `G` models `uniform_random_bit_generator` only if

(2.1) — `G::min() <= g()`,

(2.2) — `g() <= G::max()`, and

(2.3) — `g()` has amortized constant complexity.

3 A class `G` meets the *uniform random bit generator* requirements if `G` models `uniform_random_bit_generator`, `invoke_result_t<G&>` is an unsigned integer type (6.8.2), and `G` provides a nested *typedef-name* `result_type` that denotes the same type as `invoke_result_t<G&>`.

26.6.3.4 Random number engine requirements [rand.req.eng]

1 A *random number engine* (commonly shortened to *engine*) `e` of type `E` is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.

2 At any given time, `e` has a state $\mathtt{e}_i$ for some integer $i \geq 0$. Upon construction, `e` has an initial state $\mathtt{e}_0$. An engine's state may be established via a constructor, a `seed` function, assignment, or a suitable `operator>>`.

3 `E`'s specification shall define:

(3.1) — the size of `E`'s state in multiples of the size of `result_type`, given as an integral constant expression;

(3.2) — the *transition algorithm* TA by which `e`'s state $\mathtt{e}_i$ is advanced to its *successor state* $\mathtt{e}_{i+1}$; and

(3.3) — the *generation algorithm* GA by which an engine's state is mapped to a value of type `result_type`.

4 A class `E` that meets the requirements of a uniform random bit generator (26.6.3.3) also meets the requirements of a *random number engine* if the expressions shown in Table 94 are valid and have the indicated semantics, and if `E` also meets all other requirements of this subclause 26.6.3.4. In that Table and throughout this subclause:

(4.1) — `T` is the type named by `E`'s associated `result_type`;

(4.2) — `e` is a value of `E`, `v` is an lvalue of `E`, `x` and `y` are (possibly `const`) values of `E`;

(4.3) — `s` is a value of `T`;

(4.4) — `q` is an lvalue meeting the requirements of a seed sequence (26.6.3.2);

(4.5) — `z` is a value of type `unsigned long long`;

(4.6) — `os` is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and

(4.7) — `is` is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 21 and Clause 29.

Table 94: Random number engine requirements [tab:rand.req.eng]

Expression	Return type	Pre/post-condition	Complexity
`E()`		Creates an engine with the same initial state as all other default-constructed engines of type `E`.	$\mathcal{O}$(size of state)
`E(x)`		Creates an engine that compares equal to `x`.	$\mathcal{O}$(size of state)
`E(s)`		Creates an engine with initial state determined by `s`.	$\mathcal{O}$(size of state)
`E(q)`[247]		Creates an engine with an initial state that depends on a sequence produced by one call to `q.generate`.	same as complexity of `q.generate` called on a sequence whose length is size of state
`e.seed()`	`void`	*Postconditions*: `e == E()`.	same as `E()`
`e.seed(s)`	`void`	*Postconditions*: `e == E(s)`.	same as `E(s)`
`e.seed(q)`	`void`	*Postconditions*: `e == E(q)`.	same as `E(q)`
`e()`	`T`	Advances `e`'s state $\mathtt{e}_i$ to $\mathtt{e}_{i+1}$ = TA($\mathtt{e}_i$) and returns GA($\mathtt{e}_i$).	per 26.6.3.3
`e.discard(z)`[248]	`void`	Advances `e`'s state $\mathtt{e}_i$ to $\mathtt{e}_{i+\mathtt{z}}$ by any means equivalent to `z` consecutive calls `e()`.	no worse than the complexity of `z` consecutive calls `e()`

247) This constructor (as well as the subsequent corresponding `seed()` function) can be particularly useful to applications requiring a large number of independent random sequences.

248) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes `z` consecutive calls `e()`.

Expression	Return type	Pre/post-condition	Complexity
`x == y`	`bool`	This operator is an equivalence relation. With S_x and S_y as the infinite sequences of values that would be generated by repeated future calls to `x()` and `y()`, respectively, returns `true` if $S_x = S_y$; else returns `false`.	$\mathcal{O}$(size of state)
`x != y`	`bool`	`!(x == y)`.	$\mathcal{O}$(size of state)
`os << x`	reference to the type of `os`	With `os.`*fmtflags* set to `ios_base::dec|ios_base::left` and the fill character set to the space character, writes to `os` the textual representation of `x`'s current state. In the output, adjacent numbers are separated by one or more space characters. *Postconditions*: The `os.`*fmtflags* and fill character are unchanged.	$\mathcal{O}$(size of state)
`is >> v`	reference to the type of `is`	With `is.fmtflags` set to `ios_base::dec`, sets `v`'s state as determined by reading its textual representation from `is`. If bad input is encountered, ensures that `v`'s state is unchanged by the operation and calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (29.5.5.4)). If a textual representation written via `os << x` was subsequently read via `is >> v`, then `x == v` provided that there have been no intervening invocations of `x` or of `v`. *Preconditions*: `is` provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of `is`, and whose type's template specialization arguments `charT` and `traits` were respectively the same as those of `is`. *Postconditions*: The `is.`*fmtflags* are unchanged.	$\mathcal{O}$(size of state)

5 `E` shall meet the *Cpp17CopyConstructible* (Table 29) and *Cpp17CopyAssignable* (Table 31) requirements. These operations shall each be of complexity no worse than $\mathcal{O}$(size of state).

26.6.3.5 Random number engine adaptor requirements [rand.req.adapt]

1 A *random number engine adaptor* (commonly shortened to *adaptor*) `a` of type `A` is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine `b` of type `B` adapted in this way is termed a *base engine* in this context. The expression `a.base()` shall be valid and shall return a const reference to `a`'s base engine.

2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

```
A::A();
```

3 *Effects*: The base engine is initialized as if by its default constructor.

```
bool operator==(const A& a1, const A& a2);
```

4 *Returns*: `true` if `a1`'s base engine is equal to `a2`'s base engine. Otherwise returns `false`.

```
A::A(result_type s);
```

5 *Effects*: The base engine is initialized with `s`.

```
template<class Sseq> A::A(Sseq& q);
```

6 *Effects*: The base engine is initialized with `q`.

```
void seed();
```

7 *Effects*: With `b` as the base engine, invokes `b.seed()`.

```
void seed(result_type s);
```

8 *Effects*: With `b` as the base engine, invokes `b.seed(s)`.

```
template<class Sseq> void seed(Sseq& q);
```

9 *Effects*: With `b` as the base engine, invokes `b.seed(q)`.

10 `A` shall also meet the following additional requirements:

(10.1) — The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.

(10.2) — The state of `A` shall include the state of its base engine. The size of `A`'s state shall be no less than the size of the base engine.

(10.3) — Copying `A`'s state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of `A`.

(10.4) — The textual representation of `A` shall include the textual representation of its base engine.

26.6.3.6 Random number distribution requirements [rand.req.dist]

1 A *random number distribution* (commonly shortened to *distribution*) `d` of type `D` is a function object returning values that are distributed according to an associated mathematical *probability density function* $p(z)$ or according to an associated *discrete probability function* $P(z_i)$. A distribution's specification identifies its associated probability function $p(z)$ or $P(z_i)$.

2 An associated probability function is typically expressed using certain externally-supplied quantities known as the *parameters of the distribution*. Such distribution parameters are identified in this context by writing, for example, $p(z \mid a, b)$ or $P(z_i \mid a, b)$, to name specific parameters, or by writing, for example, $p(z \mid \{\texttt{p}\})$ or $P(z_i \mid \{\texttt{p}\})$, to denote a distribution's parameters `p` taken as a whole.

3 A class `D` meets the requirements of a *random number distribution* if the expressions shown in Table 95 are valid and have the indicated semantics, and if `D` and its associated types also meet all other requirements of this subclause 26.6.3.6. In that Table and throughout this subclause,

(3.1) — `T` is the type named by `D`'s associated `result_type`;

(3.2) — `P` is the type named by `D`'s associated `param_type`;

(3.3) — `d` is a value of `D`, and `x` and `y` are (possibly `const`) values of `D`;

(3.4) — `glb` and `lub` are values of `T` respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by `d`'s `operator()`, as determined by the current values of `d`'s parameters;

(3.5) — `p` is a (possibly `const`) value of `P`;

(3.6) — `g`, `g1`, and `g2` are lvalues of a type meeting the requirements of a uniform random bit generator (26.6.3.3);

(3.7) — `os` is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and

(3.8) — `is` is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`; where `charT` and `traits` are constrained according to Clause 21 and Clause 29.

Table 95: Random number distribution requirements [tab:rand.req.dist]

Expression	Return type	Pre/post-condition	Complexity
`D::result_type`	`T`	`T` is an arithmetic type (6.8.2).	compile-time
`D::param_type`	`P`		compile-time
`D()`		Creates a distribution whose behavior is indistinguishable from that of any other newly default-constructed distribution of type `D`.	constant
`D(p)`		Creates a distribution whose behavior is indistinguishable from that of a distribution newly constructed directly from the values used to construct `p`.	same as `p`'s construction
`d.reset()`	`void`	Subsequent uses of `d` do not depend on values produced by any engine prior to invoking `reset`.	constant
`x.param()`	`P`	Returns a value `p` such that `D(p).param() == p`.	no worse than the complexity of `D(p)`
`d.param(p)`	`void`	*Postconditions*: `d.param() == p`.	no worse than the complexity of `D(p)`
`d(g)`	`T`	With `p` = `d.param()`, the sequence of numbers returned by successive invocations with the same object `g` is randomly distributed according to the associated $p(z \mid \{\texttt{p}\})$ or $P(z_i \mid \{\texttt{p}\})$ function.	amortized constant number of invocations of `g`
`d(g,p)`	`T`	The sequence of numbers returned by successive invocations with the same objects `g` and `p` is randomly distributed according to the associated $p(z \mid \{\texttt{p}\})$ or $P(z_i \mid \{\texttt{p}\})$ function.	amortized constant number of invocations of `g`
`x.min()`	`T`	Returns `glb`.	constant
`x.max()`	`T`	Returns `lub`.	constant
`x == y`	`bool`	This operator is an equivalence relation. Returns `true` if `x.param() == y.param()` and $S_1 = S_2$, where S_1 and S_2 are the infinite sequences of values that would be generated, respectively, by repeated future calls to `x(g1)` and `y(g2)` whenever `g1 == g2`. Otherwise returns `false`.	constant
`x != y`	`bool`	`!(x == y)`.	same as `x == y`.

Expression	Return type	Pre/post-condition	Complexity
`os << x`	reference to the type of `os`	Writes to `os` a textual representation for the parameters and the additional internal data of `x`. *Postconditions*: The `os.`*fmtflags* and fill character are unchanged.	
`is >> d`	reference to the type of `is`	Restores from `is` the parameters and additional internal data of the lvalue `d`. If bad input is encountered, ensures that `d` is unchanged by the operation and calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (29.5.5.4)). *Preconditions*: `is` provides a textual representation that was previously written using an `os` whose imbued locale and whose type's template specialization arguments `charT` and `traits` were the same as those of `is`. *Postconditions*: The `is.`*fmtflags* are unchanged.	

4 `D` shall meet the *Cpp17CopyConstructible* (Table 29) and *Cpp17CopyAssignable* (Table 31) requirements.

5 The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of `D` between any of the invocations `d(g)`.

6 If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.

7 It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In this subclause 26.6, declarations of `D::param_type` are in the form of `typedef`s for convenience of exposition only.

8 `P` shall meet the *Cpp17CopyConstructible* (Table 29), *Cpp17CopyAssignable* (Table 31), and *Cpp17EqualityComparable* (Table 25) requirements.

9 For each of the constructors of `D` taking arguments corresponding to parameters of the distribution, `P` shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of `D` that return values corresponding to parameters of the distribution, `P` shall have a corresponding member function with the identical name, type, and semantics.

10 `P` shall have a declaration of the form

```
using distribution_type =  D;
```

26.6.4 Random number engine class templates [rand.eng]

26.6.4.1 General [rand.eng.general]

1 Each type instantiated from a class template specified in 26.6.4 meets the requirements of a random number engine (26.6.3.4) type.

2 Except where specified otherwise, the complexity of each function specified in 26.6.4 is constant.

3 Except where specified otherwise, no function described in 26.6.4 throws an exception.

4 Every function described in 26.6.4 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.

5 Descriptions are provided in 26.6.4 only for engine operations that are not described in 26.6.3.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6 Each template specified in 26.6.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

7 For every random number engine and for every random number engine adaptor `X` defined in 26.6.4 and in 26.6.5:

(7.1) — if the constructor

```
template<class Sseq> explicit X(Sseq& q);
```

is called with a type `Sseq` that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

(7.2) — if the member function

```
template<class Sseq> void seed(Sseq& q);
```

is called with a type `Sseq` that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to `X::result_type`.

26.6.4.2 Class template `linear_congruential_engine` [rand.eng.lcong]

1 A `linear_congruential_engine` random number engine produces unsigned integer random numbers. The state $\mathtt{x}_i$ of a `linear_congruential_engine` object `x` is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form $\mathsf{TA}(\mathtt{x}_i) = (a \cdot \mathtt{x}_i + c) \bmod m$; the generation algorithm is $\mathsf{GA}(\mathtt{x}_i) = \mathtt{x}_{i+1}$.

```
template<class UIntType, UIntType a, UIntType c, UIntType m>
  class linear_congruential_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type multiplier = a;
    static constexpr result_type increment = c;
    static constexpr result_type modulus = m;
    static constexpr result_type min() { return c == 0u ? 1u: 0u; }
    static constexpr result_type max() { return m - 1u; }
    static constexpr result_type default_seed = 1u;

    // constructors and seeding functions
    linear_congruential_engine() : linear_congruential_engine(default_seed) {}
    explicit linear_congruential_engine(result_type s);
    template<class Sseq> explicit linear_congruential_engine(Sseq& q);
    void seed(result_type s = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);
  };
```

2 If the template parameter `m` is 0, the modulus m used throughout this subclause 26.6.4.2 is `numeric_limits<result_type>::max()` plus 1.

[*Note 1*: m need not be representable as a value of type `result_type`. — *end note*]

3 If the template parameter `m` is not 0, the following relations shall hold: `a < m` and `c < m`.

4 The textual representation consists of the value of $\mathtt{x}_i$.

```
explicit linear_congruential_engine(result_type s);
```

5 *Effects*: If $c \bmod m$ is 0 and `s` mod m is 0, sets the engine's state to 1, otherwise sets the engine's state to `s` mod m.

```
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

6 *Effects*: With $k = \left\lceil \frac{\log_2 m}{32} \right\rceil$ and a an array (or equivalent) of length $k + 3$, invokes `q.generate(`$a + 0$`,` $a + k + 3$`)` and then computes $S = \left(\sum_{j=0}^{k-1} a_{j+3} \cdot 2^{32j}\right) \bmod m$. If $c \bmod m$ is 0 and S is 0, sets the engine's state to 1, else sets the engine's state to S.

26.6.4.3 Class template `mersenne_twister_engine` [rand.eng.mers]

1 A `mersenne_twister_engine` random number engine[249] produces unsigned integer random numbers in the closed interval $[0, 2^w - 1]$. The state x_i of a `mersenne_twister_engine` object `x` is of size n and consists of a sequence X of n values of the type delivered by `x`; all subscripts applied to X are to be taken modulo n.

2 The transition algorithm employs a twisted generalized feedback shift register defined by shift values n and m, a twist value r, and a conditional xor-mask a. To improve the uniformity of the result, the bits of the raw shift register are additionally *tempered* (i.e., scrambled) according to a bit-scrambling matrix defined by values u, d, s, b, t, c, and ℓ.

The state transition is performed as follows:

(2.1) — Concatenate the upper $w - r$ bits of X_{i-n} with the lower r bits of X_{i+1-n} to obtain an unsigned integer value Y.

(2.2) — With $\alpha = a \cdot (Y \mathsf{\ bitand\ } 1)$, set X_i to $X_{i+m-n} \mathsf{\ xor\ } (Y \mathsf{\ rshift\ } 1) \mathsf{\ xor\ } \alpha$.

The sequence X is initialized with the help of an initialization multiplier f.

3 The generation algorithm determines the unsigned integer values z_1, z_2, z_3, z_4 as follows, then delivers z_4 as its result:

(3.1) — Let $z_1 = X_i \mathsf{\ xor\ } \big((X_i \mathsf{\ rshift\ } u) \mathsf{\ bitand\ } d\big)$.

(3.2) — Let $z_2 = z_1 \mathsf{\ xor\ } \big((z_1 \mathsf{\ lshift}_w\ s) \mathsf{\ bitand\ } b\big)$.

(3.3) — Let $z_3 = z_2 \mathsf{\ xor\ } \big((z_2 \mathsf{\ lshift}_w\ t) \mathsf{\ bitand\ } c\big)$.

(3.4) — Let $z_4 = z_3 \mathsf{\ xor\ } (z_3 \mathsf{\ rshift\ } \ell)$.

```
template<class UIntType, size_t w, size_t n, size_t m, size_t r,
         UIntType a, size_t u, UIntType d, size_t s,
         UIntType b, size_t t,
         UIntType c, size_t l, UIntType f>
  class mersenne_twister_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t state_size = n;
    static constexpr size_t shift_size = m;
    static constexpr size_t mask_bits = r;
    static constexpr UIntType xor_mask = a;
    static constexpr size_t tempering_u = u;
    static constexpr UIntType tempering_d = d;
    static constexpr size_t tempering_s = s;
    static constexpr UIntType tempering_b = b;
    static constexpr size_t tempering_t = t;
    static constexpr UIntType tempering_c = c;
    static constexpr size_t tempering_l = l;
    static constexpr UIntType initialization_multiplier = f;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return  2^w − 1; }
```

249) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.

```
    static constexpr result_type default_seed = 5489u;

    // constructors and seeding functions
    mersenne_twister_engine() : mersenne_twister_engine(default_seed) {}
    explicit mersenne_twister_engine(result_type value);
    template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
    void seed(result_type value = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);
  };
```

4 The following relations shall hold: `0 < m`, `m <= n`, `2u < w`, `r <= w`, `u <= w`, `s <= w`, `t <= w`, `l <= w`, `w <= numeric_limits<UIntType>::digits`, `a <= (1u<<w) - 1u`, `b <= (1u<<w) - 1u`, `c <= (1u<<w) - 1u`, `d <= (1u<<w) - 1u`, and `f <= (1u<<w) - 1u`.

5 The textual representation of $\texttt{x}_i$ consists of the values of $X_{i-n}, \ldots, X_{i-1}$, in that order.

`explicit mersenne_twister_engine(result_type value);`

6 *Effects*: Sets X_{-n} to `value` mod 2^w. Then, iteratively for $i = 1-n, \ldots, -1$, sets X_i to

$$\left[f \cdot \left(X_{i-1} \mathsf{~xor~} \left(X_{i-1} \mathsf{~rshift~} (w-2)\right)\right) + i \bmod n\right] \bmod 2^w .$$

7 *Complexity*: $\mathcal{O}(n)$.

`template<class Sseq> explicit mersenne_twister_engine(Sseq& q);`

8 *Effects*: With $k = \lceil w/32 \rceil$ and a an array (or equivalent) of length $n \cdot k$, invokes `q.generate(`$a+0$`,` $a+n\cdot k$`)` and then, iteratively for $i = -n, \ldots, -1$, sets X_i to $\left(\sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j}\right) \bmod 2^w$. Finally, if the most significant $w-r$ bits of X_{-n} are zero, and if each of the other resulting X_i is 0, changes X_{-n} to 2^{w-1}.

26.6.4.4 Class template `subtract_with_carry_engine` [rand.eng.sub]

1 A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.

2 The state $\texttt{x}_i$ of a `subtract_with_carry_engine` object `x` is of size $\mathcal{O}(r)$, and consists of a sequence X of r integer values $0 \le X_i < m = 2^w$; all subscripts applied to X are to be taken modulo r. The state $\texttt{x}_i$ additionally consists of an integer c (known as the *carry*) whose value is either 0 or 1.

3 The state transition is performed as follows:

(3.1) — Let $Y = X_{i-s} - X_{i-r} - c$.

(3.2) — Set X_i to $y = Y \bmod m$. Set c to 1 if $Y < 0$, otherwise set c to 0.

[*Note 1*: This algorithm corresponds to a modular linear function of the form $\mathsf{TA}(\texttt{x}_i) = (a \cdot \texttt{x}_i) \bmod b$, where b is of the form $m^r - m^s + 1$ and $a = b - (b-1)/m$. — *end note*]

4 The generation algorithm is given by $\mathsf{GA}(\texttt{x}_i) = y$, where y is the value produced as a result of advancing the engine's state as described above.

```
template<class UIntType, size_t w, size_t s, size_t r>
  class subtract_with_carry_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t short_lag = s;
    static constexpr size_t long_lag = r;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return m − 1; }
    static constexpr result_type default_seed = 19780503u;
```

```
    // constructors and seeding functions
    subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {}
    explicit subtract_with_carry_engine(result_type value);
    template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
    void seed(result_type value = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);
  };
```

5 The following relations shall hold: `0u < s`, `s < r`, `0 < w`, and `w <= numeric_limits<UIntType>::digits`.

6 The textual representation consists of the values of $X_{i-r}, \dots, X_{i-1}$, in that order, followed by c.

```
explicit subtract_with_carry_engine(result_type value);
```

7 *Effects*: Sets the values of $X_{-r}, \dots, X_{-1}$, in that order, as specified below. If X_{-1} is then 0, sets c to 1; otherwise sets c to 0.

To set the values X_k, first construct `e`, a `linear_congruential_engine` object, as if by the following definition:

```
linear_congruential_engine<result_type,
                           40014u,0u,2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each X_k, obtain new values $z_0, \dots, z_{n-1}$ from $n = \lceil w/32 \rceil$ successive invocations of `e` taken modulo 2^{32}. Set X_k to $\left(\sum_{j=0}^{n-1} z_j \cdot 2^{32j}\right)$ mod m.

8 *Complexity*: Exactly $n \cdot$ `r` invocations of `e`.

```
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
```

9 *Effects*: With $k = \lceil w/32 \rceil$ and a an array (or equivalent) of length $r \cdot k$, invokes `q.generate(`$a + 0$`,` $a + r \cdot k$`)` and then, iteratively for $i = -r, \dots, -1$, sets X_i to $\left(\sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j}\right)$ mod m. If X_{-1} is then 0, sets c to 1; otherwise sets c to 0.

26.6.5 Random number engine adaptor class templates [rand.adapt]

26.6.5.1 In general [rand.adapt.general]

1 Each type instantiated from a class template specified in this subclause 26.6.5 meets the requirements of a random number engine adaptor (26.6.3.5) type.

2 Except where specified otherwise, the complexity of each function specified in this subclause 26.6.5 is constant.

3 Except where specified otherwise, no function described in this subclause 26.6.5 throws an exception.

4 Every function described in this subclause 26.6.5 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.

5 Descriptions are provided in this subclause 26.6.5 only for adaptor operations that are not described in subclause 26.6.3.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6 Each template specified in this subclause 26.6.5 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

26.6.5.2 Class template `discard_block_engine` [rand.adapt.disc]

1 A `discard_block_engine` random number engine adaptor produces random numbers selected from those produced by some base engine e. The state $\mathtt{x}_i$ of a `discard_block_engine` engine adaptor object `x` consists of the state $\mathtt{e}_i$ of its base engine `e` and an additional integer n. The size of the state is the size of e's state plus 1.

2 The transition algorithm discards all but $r > 0$ values from each block of $p \geq r$ values delivered by e. The state transition is performed as follows: If $n \geq r$, advance the state of `e` from $\mathtt{e}_i$ to $\mathtt{e}_{i+p-r}$ and set n to 0. In any case, then increment n and advance `e`'s then-current state $\mathtt{e}_j$ to $\mathtt{e}_{j+1}$.

3 The generation algorithm yields the value returned by the last invocation of `e()` while advancing `e`'s state as described above.

```
template<class Engine, size_t p, size_t r>
  class discard_block_engine {
  public:
    // types
    using result_type = typename Engine::result_type;

    // engine characteristics
    static constexpr size_t block_size = p;
    static constexpr size_t used_block = r;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    // constructors and seeding functions
    discard_block_engine();
    explicit discard_block_engine(const Engine& e);
    explicit discard_block_engine(Engine&& e);
    explicit discard_block_engine(result_type s);
    template<class Sseq> explicit discard_block_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; };

  private:
    Engine e;     // exposition only
    int n;        // exposition only
  };
```

4 The following relations shall hold: `0 < r` and `r <= p`.

5 The textual representation consists of the textual representation of `e` followed by the value of `n`.

6 In addition to its behavior pursuant to subclause 26.6.3.5, each constructor that is not a copy constructor sets `n` to 0.

26.6.5.3 Class template `independent_bits_engine` [rand.adapt.ibits]

1 An `independent_bits_engine` random number engine adaptor combines random numbers that are produced by some base engine e, so as to produce random numbers with a specified number of bits w. The state $\mathtt{x}_i$ of an `independent_bits_engine` engine adaptor object `x` consists of the state $\mathtt{e}_i$ of its base engine `e`; the size of the state is the size of e's state.

2 The transition and generation algorithms are described in terms of the following integral constants:

(2.1) — Let $R = \mathtt{e.max() - e.min() + 1}$ and $m = \lfloor \log_2 R \rfloor$.

(2.2) — With n as determined below, let $w_0 = \lfloor w/n \rfloor$, $n_0 = n - w \bmod n$, $y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor$, and $y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor$.

(2.3) — Let $n = \lceil w/m \rceil$ if and only if the relation $R - y_0 \leq \lfloor y_0/n \rfloor$ holds as a result. Otherwise let $n = 1 + \lceil w/m \rceil$.

[*Note 1*: The relation $w = n_0 w_0 + (n - n_0)(w_0 + 1)$ always holds. —*end note*]

3 The transition algorithm is carried out by invoking `e()` as often as needed to obtain n_0 values less than $y_0 + \mathtt{e.min()}$ and $n - n_0$ values less than $y_1 + \mathtt{e.min()}$.

4 The generation algorithm uses the values produced while advancing the state as described above to yield a quantity S obtained as if by the following algorithm:

```
S = 0;
for (k = 0; k ≠ n_0; k += 1)  {
 do u = e() - e.min(); while (u ≥ y_0);
 S = 2^{w_0} · S + u mod 2^{w_0};
}
for (k = n_0; k ≠ n; k += 1)  {
 do u = e() - e.min(); while (u ≥ y_1);
 S = 2^{w_0+1} · S + u mod 2^{w_0+1};
}
```

```
template<class Engine, size_t w, class UIntType>
  class independent_bits_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return 2^w − 1; }

    // constructors and seeding functions
    independent_bits_engine();
    explicit independent_bits_engine(const Engine& e);
    explicit independent_bits_engine(Engine&& e);
    explicit independent_bits_engine(result_type s);
    template<class Sseq> explicit independent_bits_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; };

  private:
    Engine e;    // exposition only
  };
```

5 The following relations shall hold: `0 < w` and `w <= numeric_limits<result_type>::digits`.

6 The textual representation consists of the textual representation of `e`.

26.6.5.4 Class template `shuffle_order_engine` [rand.adapt.shuf]

1 A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine e, but delivers them in a different sequence. The state $\mathtt{x}_i$ of a `shuffle_order_engine` engine adaptor object `x` consists of the state $\mathtt{e}_i$ of its base engine `e`, an additional value Y of the type delivered by `e`, and an additional sequence V of k values also of the type delivered by `e`. The size of the state is the size of e's state plus $k + 1$.

2 The transition algorithm permutes the values produced by e. The state transition is performed as follows:

(2.1) — Calculate an integer $j = \left\lfloor \frac{k\cdot(Y-e_{\min})}{e_{\max}-e_{\min}+1} \right\rfloor$.

(2.2) — Set Y to V_j and then set V_j to `e()`.

3 The generation algorithm yields the last value of `Y` produced while advancing `e`'s state as described above.

```
template<class Engine, size_t k>
  class shuffle_order_engine {
  public:
    // types
    using result_type = typename Engine::result_type;
```

```
    // engine characteristics
    static constexpr size_t table_size = k;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    // constructors and seeding functions
    shuffle_order_engine();
    explicit shuffle_order_engine(const Engine& e);
    explicit shuffle_order_engine(Engine&& e);
    explicit shuffle_order_engine(result_type s);
    template<class Sseq> explicit shuffle_order_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; };

  private:
    Engine e;           // exposition only
    result_type V[k];   // exposition only
    result_type Y;      // exposition only
  };
```

4 The following relation shall hold: `0 < k`.

5 The textual representation consists of the textual representation of `e`, followed by the `k` values of V, followed by the value of Y.

6 In addition to its behavior pursuant to subclause 26.6.3.5, each constructor that is not a copy constructor initializes `V[0]`, . . . , `V[k-1]` and Y, in that order, with values returned by successive invocations of `e()`.

26.6.6 Engines and engine adaptors with predefined parameters [rand.predef]

```
using minstd_rand0 =
      linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;
```

1 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `minstd_rand0` produces the value 1043618065.

```
using minstd_rand =
      linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;
```

2 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `minstd_rand` produces the value 399268537.

```
using mt19937 =
      mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
       0x9908'b0df, 11, 0xffff'ffff, 7, 0x9d2c'5680, 15, 0xefc6'0000, 18, 1'812'433'253>;
```

3 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `mt19937` produces the value 4123659995.

```
using mt19937_64 =
      mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
       0xb502'6f5a'a966'19e9, 29, 0x5555'5555'5555'5555, 17,
       0x71d6'7fff'eda6'0000, 37, 0xfff7'eee0'0000'0000, 43, 6'364'136'223'846'793'005>;
```

4 *Required behavior*: The 10000th consecutive invocation of a default-constructed object of type `mt19937_64` produces the value 9981545732273789042.

```
using ranlux24_base =
      subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;
```

5 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `ranlux24_base` produces the value 7937952.

```
using ranlux48_base =
      subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;
```

6 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `ranlux48_base` produces the value 61839128582725.

```
using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;
```

7 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `ranlux24` produces the value 9901578.

```
using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;
```

8 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `ranlux48` produces the value 249142670248501.

```
using knuth_b = shuffle_order_engine<minstd_rand0,256>;
```

9 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `knuth_b` produces the value 1112339016.

```
using default_random_engine = implementation-defined;
```

10 *Remarks*: The choice of engine type named by this `typedef` is implementation-defined.

[*Note 1*: The implementation can select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations can select different underlying engine types, code that uses this `typedef` need not generate identical sequences across implementations. — *end note*]

26.6.7 Class `random_device` [rand.device]

1 A `random_device` uniform random bit generator produces nondeterministic random numbers.

2 If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

```
class random_device {
public:
  // types
  using result_type = unsigned int;

  // generator characteristics
  static constexpr result_type min() { return numeric_limits<result_type>::min(); }
  static constexpr result_type max() { return numeric_limits<result_type>::max(); }

  // constructors
  random_device() : random_device(implementation-defined) {}
  explicit random_device(const string& token);

  // generating functions
  result_type operator()();

  // property functions
  double entropy() const noexcept;

  // no copy functions
  random_device(const random_device&) = delete;
  void operator=(const random_device&) = delete;
};
```

```
explicit random_device(const string& token);
```

3 *Throws*: A value of an implementation-defined type derived from `exception` if the `random_device` could not be initialized.

4 *Remarks*: The semantics of the `token` parameter and the token value used by the default constructor are implementation-defined.[250]

```
double entropy() const noexcept;
```

5 *Returns*: If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate[251] for the random numbers returned by `operator()`, in the range `min()` to $\log_2(\texttt{max()} + 1)$.

```
result_type operator()();
```

6 *Returns*: A nondeterministic random value, uniformly distributed between `min()` and `max()` (inclusive). It is implementation-defined how these values are generated.

7 *Throws*: A value of an implementation-defined type derived from `exception` if a random number could not be obtained.

26.6.8 Utilities [rand.util]

26.6.8.1 Class seed_seq [rand.util.seedseq]

```
class seed_seq {
public:
  // types
  using result_type = uint_least32_t;

  // constructors
  seed_seq();
  template<class T>
    seed_seq(initializer_list<T> il);
  template<class InputIterator>
    seed_seq(InputIterator begin, InputIterator end);

  // generating functions
  template<class RandomAccessIterator>
    void generate(RandomAccessIterator begin, RandomAccessIterator end);

  // property functions
  size_t size() const noexcept;
  template<class OutputIterator>
    void param(OutputIterator dest) const;

  // no copy functions
  seed_seq(const seed_seq&) = delete;
  void operator=(const seed_seq&) = delete;

private:
  vector<result_type> v;          // exposition only
};
```

```
seed_seq();
```

1 *Postconditions*: `v.empty()` is `true`.

2 *Throws*: Nothing.

```
template<class T>
 seed_seq(initializer_list<T> il);
```

3 *Mandates*: `T` is an integer type.

4 *Effects*: Same as `seed_seq(il.begin(), il.end())`.

250) The parameter is intended to allow an implementation to differentiate between different sources of randomness.
251) If a device has n states whose respective probabilities are $P_0, \dots, P_{n-1}$, the device entropy S is defined as $S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i$.

```
template<class InputIterator>
  seed_seq(InputIterator begin, InputIterator end);
```

5 *Mandates*: `iterator_traits<InputIterator>::value_type` is an integer type.

6 *Preconditions*: `InputIterator` meets the *Cpp17InputIterator* requirements (23.3.5.3).

7 *Effects*: Initializes `v` by the following algorithm:

```
for (InputIterator s = begin; s != end; ++s)
 v.push_back((*s)mod2^32);
```

```
template<class RandomAccessIterator>
  void generate(RandomAccessIterator begin, RandomAccessIterator end);
```

8 *Mandates*: `iterator_traits<RandomAccessIterator>::value_type` is an unsigned integer type capable of accommodating 32-bit quantities.

9 *Preconditions*: `RandomAccessIterator` meets the *Cpp17RandomAccessIterator* requirements (23.3.5.7) and the requirements of a mutable iterator.

10 *Effects*: Does nothing if `begin == end`. Otherwise, with $s = \texttt{v.size()}$ and $n = \texttt{end} - \texttt{begin}$, fills the supplied range $[\texttt{begin}, \texttt{end})$ according to the following algorithm in which each operation is to be carried out modulo 2^{32}, each indexing operator applied to `begin` is to be taken modulo n, and $T(x)$ is defined as $x \;\mathsf{xor}\; (x \;\mathsf{rshift}\; 27)$:

(10.1) — By way of initialization, set each element of the range to the value `0x8b8b8b8b`. Additionally, for use in subsequent steps, let $p = (n - t)/2$ and let $q = p + t$, where

$$t = (n \geq 623) \ ? \ 11 : (n \geq 68) \ ? \ 7 : (n \geq 39) \ ? \ 5 : (n \geq 7) \ ? \ 3 : (n-1)/2;$$

(10.2) — With m as the larger of $s + 1$ and n, transform the elements of the range: iteratively for $k = 0, \ldots, m - 1$, calculate values

$$\begin{aligned} r_1 &= 1664525 \cdot T(\texttt{begin}[k] \;\mathsf{xor}\; \texttt{begin}[k+p] \;\mathsf{xor}\; \texttt{begin}[k-1]) \\ r_2 &= r_1 + \begin{cases} s & , k = 0 \\ k \bmod n + \texttt{v}[k-1] & , 0 < k \leq s \\ k \bmod n & , s < k \end{cases} \end{aligned}$$

and, in order, increment $\texttt{begin}[k+p]$ by r_1, increment $\texttt{begin}[k+q]$ by r_2, and set $\texttt{begin}[k]$ to r_2.

(10.3) — Transform the elements of the range again, beginning where the previous step ended: iteratively for $k = m, \ldots, m + n - 1$, calculate values

$$\begin{aligned} r_3 &= 1566083941 \cdot T(\texttt{begin}[k] + \texttt{begin}[k+p] + \texttt{begin}[k-1]) \\ r_4 &= r_3 - (k \bmod n) \end{aligned}$$

and, in order, update $\texttt{begin}[k+p]$ by xoring it with r_3, update $\texttt{begin}[k+q]$ by xoring it with r_4, and set $\texttt{begin}[k]$ to r_4.

11 *Throws*: What and when `RandomAccessIterator` operations of `begin` and `end` throw.

```
size_t size() const noexcept;
```

12 *Returns*: The number of 32-bit units that would be returned by a call to `param()`.

13 *Complexity*: Constant time.

```
template<class OutputIterator>
  void param(OutputIterator dest) const;
```

14 *Mandates*: Values of type `result_type` are writable (23.3.1) to `dest`.

15 *Preconditions*: `OutputIterator` meets the *Cpp17OutputIterator* requirements (23.3.5.4).

16 *Effects*: Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

```
copy(v.begin(), v.end(), dest);
```

17 *Throws*: What and when `OutputIterator` operations of `dest` throw.

26.6.8.2 Function template generate_canonical [rand.util.canonical]

```
template<class RealType, size_t bits, class URBG>
  RealType generate_canonical(URBG& g);
```

1 *Complexity*: Exactly $k = \max(1, \lceil b / \log_2 R \rceil)$ invocations of `g`, where b[252] is the lesser of `numeric_limits<RealType>::digits` and `bits`, and R is the value of `g.max()` $-$ `g.min()` $+ 1$.

2 *Effects*: Invokes `g()` k times to obtain values $g_0, \ldots, g_{k-1}$, respectively. Calculates a quantity

$$S = \sum_{i=0}^{k-1} (g_i - \texttt{g.min()}) \cdot R^i$$

using arithmetic of type `RealType`.

3 *Returns*: S/R^k.

[*Note 1*: $0 \le S/R^k < 1$. — *end note*]

4 *Throws*: What and when `g` throws.

5 [*Note 2*: If the values g_i produced by `g` are uniformly distributed, the instantiation's results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution. — *end note*]

26.6.9 Random number distribution class templates [rand.dist]

26.6.9.1 In general [rand.dist.general]

1 Each type instantiated from a class template specified in this subclause 26.6.9 meets the requirements of a random number distribution (26.6.3.6) type.

2 Descriptions are provided in this subclause 26.6.9 only for distribution operations that are not described in 26.6.3.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

3 The algorithms for producing each of the specified distributions are implementation-defined.

4 The value of each probability density function $p(z)$ and of each discrete probability function $P(z_i)$ specified in this subclause is 0 everywhere outside its stated domain.

26.6.9.2 Uniform distributions [rand.dist.uni]

26.6.9.2.1 Class template uniform_int_distribution [rand.dist.uni.int]

1 A `uniform_int_distribution` random number distribution produces random integers i, $a \le i \le b$, distributed according to the constant discrete probability function

$$P(i \,|\, a, b) = 1/(b - a + 1)\ .$$

```
template<class IntType = int>
  class uniform_int_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructors and reset functions
    uniform_int_distribution() : uniform_int_distribution(0) {}
    explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
    explicit uniform_int_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);
```

252) b is introduced to avoid any attempt to produce more bits of randomness than can be held in `RealType`.

```
    // property functions
    result_type a() const;
    result_type b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
```

2 *Preconditions*: `a` $\leq$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
result_type a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
result_type b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

26.6.9.2.2 Class template `uniform_real_distribution` [rand.dist.uni.real]

1 A `uniform_real_distribution` random number distribution produces random numbers x, $a \leq x < b$, distributed according to the constant probability density function

$$p(x \mid a, b) = 1/(b - a) \ .$$

[*Note 1*: This implies that $p(x \mid a, b)$ is undefined when `a == b`. — *end note*]

```
template<class RealType = double>
  class uniform_real_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructors and reset functions
    uniform_real_distribution() : uniform_real_distribution(0.0) {}
    explicit uniform_real_distribution(RealType a, RealType b = 1.0);
    explicit uniform_real_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    result_type a() const;
    result_type b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit uniform_real_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: `a` $\leq$ `b` and `b` $-$ `a` $\leq$ `numeric_limits<RealType>::max()`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
result_type a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
result_type b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

26.6.9.3 Bernoulli distributions [rand.dist.bern]

26.6.9.3.1 Class `bernoulli_distribution` [rand.dist.bern.bernoulli]

1 A `bernoulli_distribution` random number distribution produces `bool` values b distributed according to the discrete probability function

$$P(b\,|\,p) = \begin{cases} p & \text{if } b = \texttt{true}\text{, or} \\ 1-p & \text{if } b = \texttt{false}. \end{cases}$$

```
class bernoulli_distribution {
public:
  // types
  using result_type = bool;
  using param_type  = unspecified;

  // constructors and reset functions
  bernoulli_distribution() : bernoulli_distribution(0.5) {}
  explicit bernoulli_distribution(double p);
  explicit bernoulli_distribution(const param_type& parm);
  void reset();

  // generating functions
  template<class URBG>
    result_type operator()(URBG& g);
  template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

  // property functions
  double p() const;
  param_type param() const;
  void param(const param_type& parm);
  result_type min() const;
  result_type max() const;
};
```

```
explicit bernoulli_distribution(double p);
```

2 *Preconditions*: $0 \le \texttt{p} \le 1$.

3 *Remarks*: `p` corresponds to the parameter of the distribution.

```
double p() const;
```

4 *Returns*: The value of the `p` parameter with which the object was constructed.

26.6.9.3.2 Class template `binomial_distribution` [rand.dist.bern.bin]

1 A `binomial_distribution` random number distribution produces integer values $i \ge 0$ distributed according to the discrete probability function

$$P(i\,|\,t,p) = \binom{t}{i} \cdot p^i \cdot (1-p)^{t-i} \; .$$

```
template<class IntType = int>
  class binomial_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;
```

```
    // constructors and reset functions
    binomial_distribution() : binomial_distribution(1) {}
    explicit binomial_distribution(IntType t, double p = 0.5);
    explicit binomial_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    IntType t() const;
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit binomial_distribution(IntType t, double p = 0.5);
```

2 *Preconditions*: $0 \leq$ `p` ≤ 1 and $0 \leq$ `t`.

3 *Remarks*: `t` and `p` correspond to the respective parameters of the distribution.

```
IntType t() const;
```

4 *Returns*: The value of the `t` parameter with which the object was constructed.

```
double p() const;
```

5 *Returns*: The value of the `p` parameter with which the object was constructed.

26.6.9.3.3 Class template `geometric_distribution` [rand.dist.bern.geo]

1 A `geometric_distribution` random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function

$$P(i \,|\, p) = p \cdot (1-p)^i \ .$$

```
template<class IntType = int>
  class geometric_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructors and reset functions
    geometric_distribution() : geometric_distribution(0.5) {}
    explicit geometric_distribution(double p);
    explicit geometric_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit geometric_distribution(double p);
```

2 *Preconditions*: $0 < \texttt{p} < 1$.

3 *Remarks*: `p` corresponds to the parameter of the distribution.

```
double p() const;
```

4 *Returns*: The value of the `p` parameter with which the object was constructed.

26.6.9.3.4 Class template `negative_binomial_distribution` [rand.dist.bern.negbin]

1 A `negative_binomial_distribution` random number distribution produces random integers $i \geq 0$ distributed according to the discrete probability function

$$P(i \mid k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i \ .$$

[*Note 1*: This implies that $P(i \mid k, p)$ is undefined when `p == 1`. — *end note*]

```
template<class IntType = int>
  class negative_binomial_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructor and reset functions
    negative_binomial_distribution() : negative_binomial_distribution(1) {}
    explicit negative_binomial_distribution(IntType k, double p = 0.5);
    explicit negative_binomial_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    IntType k() const;
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit negative_binomial_distribution(IntType k, double p = 0.5);
```

2 *Preconditions*: $0 < \texttt{p} \leq 1$ and $0 < \texttt{k}$.

3 *Remarks*: `k` and `p` correspond to the respective parameters of the distribution.

```
IntType k() const;
```

4 *Returns*: The value of the `k` parameter with which the object was constructed.

```
double p() const;
```

5 *Returns*: The value of the `p` parameter with which the object was constructed.

26.6.9.4 Poisson distributions [rand.dist.pois]

26.6.9.4.1 Class template `poisson_distribution` [rand.dist.pois.poisson]

1 A `poisson_distribution` random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function

$$P(i \mid \mu) = \frac{e^{-\mu} \mu^i}{i\,!} \ .$$

The distribution parameter μ is also known as this distribution's *mean*.

```
template<class IntType = int>
  class poisson_distribution
  {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructors and reset functions
    poisson_distribution() : poisson_distribution(1.0) {}
    explicit poisson_distribution(double mean);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double mean() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit poisson_distribution(double mean);
```

2 *Preconditions*: $0 <$ `mean`.

3 *Remarks*: `mean` corresponds to the parameter of the distribution.

```
double mean() const;
```

4 *Returns*: The value of the `mean` parameter with which the object was constructed.

26.6.9.4.2 Class template `exponential_distribution` [rand.dist.pois.exp]

1 An `exponential_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x \mid \lambda) = \lambda e^{-\lambda x} \ .$$

```
template<class RealType = double>
  class exponential_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructors and reset functions
    exponential_distribution() : exponential_distribution(1.0) {}
    explicit exponential_distribution(RealType lambda);
    explicit exponential_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);
```

```
    // property functions
    RealType lambda() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit exponential_distribution(RealType lambda);
```

2 *Preconditions*: $0 <$ `lambda`.

3 *Remarks*: `lambda` corresponds to the parameter of the distribution.

```
RealType lambda() const;
```

4 *Returns*: The value of the `lambda` parameter with which the object was constructed.

26.6.9.4.3 Class template `gamma_distribution` [rand.dist.pois.gamma]

1 A `gamma_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x \,|\, \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \cdot \Gamma(\alpha)} \cdot x^{\alpha-1} \; .$$

```
template<class RealType = double>
  class gamma_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructors and reset functions
    gamma_distribution() : gamma_distribution(1.0) {}
    explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
    explicit gamma_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType alpha() const;
    RealType beta() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
```

2 *Preconditions*: $0 <$ `alpha` and $0 <$ `beta`.

3 *Remarks*: `alpha` and `beta` correspond to the parameters of the distribution.

```
RealType alpha() const;
```

4 *Returns*: The value of the `alpha` parameter with which the object was constructed.

```
RealType beta() const;
```

5 *Returns*: The value of the `beta` parameter with which the object was constructed.

26.6.9.4.4 Class template `weibull_distribution` [rand.dist.pois.weibull]

1 A `weibull_distribution` random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function

$$p(x \mid a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^{a}\right) \ .$$

```
template<class RealType = double>
  class weibull_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    weibull_distribution() : weibull_distribution(1.0) {}
    explicit weibull_distribution(RealType a, RealType b = 1.0);
    explicit weibull_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit weibull_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: $0 <$ `a` and $0 <$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

26.6.9.4.5 Class template `extreme_value_distribution` [rand.dist.pois.extreme]

1 An `extreme_value_distribution` random number distribution produces random numbers x distributed according to the probability density function[253]

$$p(x \mid a, b) = \frac{1}{b} \cdot \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right) \ .$$

```
template<class RealType = double>
  class extreme_value_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;
```

253) The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

```
    // constructor and reset functions
    extreme_value_distribution() : extreme_value_distribution(0.0) {}
    explicit extreme_value_distribution(RealType a, RealType b = 1.0);
    explicit extreme_value_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit extreme_value_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: $0 <$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

26.6.9.5 Normal distributions [rand.dist.norm]

26.6.9.5.1 Class template `normal_distribution` [rand.dist.norm.normal]

1 A `normal_distribution` random number distribution produces random numbers x distributed according to the probability density function

$$p(x \mid \mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} \cdot \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right) .$$

The distribution parameters μ and σ are also known as this distribution's *mean* and *standard deviation*.

```
template<class RealType = double>
  class normal_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructors and reset functions
    normal_distribution() : normal_distribution(0.0) {}
    explicit normal_distribution(RealType mean, RealType stddev = 1.0);
    explicit normal_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType mean() const;
    RealType stddev() const;
```

```
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit normal_distribution(RealType mean, RealType stddev = 1.0);
```

2 *Preconditions*: $0 <$ `stddev`.

3 *Remarks*: `mean` and `stddev` correspond to the respective parameters of the distribution.

```
RealType mean() const;
```

4 *Returns*: The value of the `mean` parameter with which the object was constructed.

```
RealType stddev() const;
```

5 *Returns*: The value of the `stddev` parameter with which the object was constructed.

26.6.9.5.2 Class template `lognormal_distribution` [rand.dist.norm.lognormal]

1 A `lognormal_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x \,|\, m, s) = \frac{1}{sx\sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right) .$$

```
template<class RealType = double>
  class lognormal_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    lognormal_distribution() : lognormal_distribution(0.0) {}
    explicit lognormal_distribution(RealType m, RealType s = 1.0);
    explicit lognormal_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType m() const;
    RealType s() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit lognormal_distribution(RealType m, RealType s = 1.0);
```

2 *Preconditions*: $0 <$ `s`.

3 *Remarks*: `m` and `s` correspond to the respective parameters of the distribution.

```
RealType m() const;
```

4 *Returns*: The value of the `m` parameter with which the object was constructed.

```
RealType s() const;
```

5 *Returns*: The value of the `s` parameter with which the object was constructed.

26.6.9.5.3 Class template `chi_squared_distribution` [rand.dist.norm.chisq]

1 A `chi_squared_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x \mid n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}} \; .$$

```
template<class RealType = double>
  class chi_squared_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    chi_squared_distribution() : chi_squared_distribution(1.0) {}
    explicit chi_squared_distribution(RealType n);
    explicit chi_squared_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit chi_squared_distribution(RealType n);
```

2 *Preconditions*: $0 <$ `n`.

3 *Remarks*: `n` corresponds to the parameter of the distribution.

```
RealType n() const;
```

4 *Returns*: The value of the `n` parameter with which the object was constructed.

26.6.9.5.4 Class template `cauchy_distribution` [rand.dist.norm.cauchy]

1 A `cauchy_distribution` random number distribution produces random numbers x distributed according to the probability density function

$$p(x \mid a, b) = \left(\pi b \left(1 + \left(\frac{x - a}{b} \right)^2 \right) \right)^{-1} \; .$$

```
template<class RealType = double>
  class cauchy_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    cauchy_distribution() : cauchy_distribution(0.0) {}
    explicit cauchy_distribution(RealType a, RealType b = 1.0);
    explicit cauchy_distribution(const param_type& parm);
    void reset();
```

```
    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit cauchy_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: $0 <$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

26.6.9.5.5 Class template `fisher_f_distribution` [rand.dist.norm.f]

1 A `fisher_f_distribution` random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function

$$p(x \,|\, m, n) = \frac{\Gamma\big((m+n)/2\big)}{\Gamma(m/2)\;\Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2)-1} \cdot \left(1 + \frac{mx}{n}\right)^{-(m+n)/2} \quad .$$

```
template<class RealType = double>
  class fisher_f_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    fisher_f_distribution() : fisher_f_distribution(1.0) {}
    explicit fisher_f_distribution(RealType m, RealType n = 1.0);
    explicit fisher_f_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType m() const;
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit fisher_f_distribution(RealType m, RealType n = 1);
```

2 *Preconditions*: $0 <$ `m` and $0 <$ `n`.

3 *Remarks*: `m` and `n` correspond to the respective parameters of the distribution.

```
RealType m() const;
```

4 *Returns*: The value of the `m` parameter with which the object was constructed.

```
RealType n() const;
```

5 *Returns*: The value of the `n` parameter with which the object was constructed.

26.6.9.5.6 Class template `student_t_distribution` [rand.dist.norm.t]

1 A `student_t_distribution` random number distribution produces random numbers x distributed according to the probability density function

$$p(x \mid n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma\big((n+1)/2\big)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2} .$$

```
template<class RealType = double>
  class student_t_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    student_t_distribution() : student_t_distribution(1.0) {}
    explicit student_t_distribution(RealType n);
    explicit student_t_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
explicit student_t_distribution(RealType n);
```

2 *Preconditions*: $0 <$ `n`.

3 *Remarks*: `n` corresponds to the parameter of the distribution.

```
RealType n() const;
```

4 *Returns*: The value of the `n` parameter with which the object was constructed.

26.6.9.6 Sampling distributions [rand.dist.samp]

26.6.9.6.1 Class template `discrete_distribution` [rand.dist.samp.discrete]

1 A `discrete_distribution` random number distribution produces random integers i, $0 \le i < n$, distributed according to the discrete probability function

$$P(i \mid p_0, \ldots, p_{n-1}) = p_i .$$

2 Unless specified otherwise, the distribution parameters are calculated as: $p_k = w_k/S$ for $k = 0, \ldots, n-1$, in which the values w_k, commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: $0 < S = w_0 + \cdots + w_{n-1}$.

```
template<class IntType = int>
  class discrete_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructor and reset functions
    discrete_distribution();
    template<class InputIterator>
      discrete_distribution(InputIterator firstW, InputIterator lastW);
    discrete_distribution(initializer_list<double> wl);
    template<class UnaryOperation>
      discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
    explicit discrete_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    vector<double> probabilities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
discrete_distribution();
```

3 *Effects*: Constructs a `discrete_distribution` object with $n = 1$ and $p_0 = 1$.

[*Note 1*: Such an object will always deliver the value 0. — *end note*]

```
template<class InputIterator>
  discrete_distribution(InputIterator firstW, InputIterator lastW);
```

4 *Mandates*: `is_convertible_v<iterator_traits<InputIterator>::value_type, double>` is `true`.

5 *Preconditions*: `InputIterator` meets the *Cpp17InputIterator* requirements (23.3.5.3). If `firstW == lastW`, let $n = 1$ and $w_0 = 1$. Otherwise, $\left[\texttt{firstW}, \texttt{lastW}\right)$ forms a sequence w of length $n > 0$.

6 *Effects*: Constructs a `discrete_distribution` object with probabilities given by the formula above.

```
discrete_distribution(initializer_list<double> wl);
```

7 *Effects*: Same as `discrete_distribution(wl.begin(), wl.end())`.

```
template<class UnaryOperation>
  discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
```

8 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

9 *Preconditions*: If $\texttt{nw} = 0$, let $n = 1$, otherwise let $n = \texttt{nw}$. The relation $0 < \delta = (\texttt{xmax} - \texttt{xmin})/n$ holds.

10 *Effects*: Constructs a `discrete_distribution` object with probabilities given by the formula above, using the following values: If $\texttt{nw} = 0$, let $w_0 = 1$. Otherwise, let $w_k = \texttt{fw}(\texttt{xmin} + k \cdot \delta + \delta/2)$ for $k = 0, \ldots, n - 1$.

11 *Complexity*: The number of invocations of `fw` does not exceed n.

```
vector<double> probabilities() const;
```

12 *Returns*: A `vector<double>` whose `size` member returns n and whose `operator[]` member returns p_k when invoked with argument k for $k = 0, \ldots, n - 1$.

26.6.9.6.2 Class template `piecewise_constant_distribution` [rand.dist.samp.pconst]

1 A `piecewise_constant_distribution` random number distribution produces random numbers x, $b_0 \le x < b_n$, uniformly distributed over each subinterval $[b_i, b_{i+1})$ according to the probability density function

$$p(x \mid b_0, \dots, b_n,\ \rho_0, \dots, \rho_{n-1}) = \rho_i \text{ , for } b_i \le x < b_{i+1}.$$

2 The $n+1$ distribution parameters b_i, also known as this distribution's *interval boundaries*, shall satisfy the relation $b_i < b_{i+1}$ for $i = 0, \dots, n-1$. Unless specified otherwise, the remaining n distribution parameters are calculated as:

$$\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \dots, n-1 \text{ ,}$$

in which the values w_k, commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: $0 < S = w_0 + \cdots + w_{n-1}$.

```
template<class RealType = double>
  class piecewise_constant_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    piecewise_constant_distribution();
    template<class InputIteratorB, class InputIteratorW>
      piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                      InputIteratorW firstW);
    template<class UnaryOperation>
      piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
      piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
                                      UnaryOperation fw);
    explicit piecewise_constant_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    vector<result_type> intervals() const;
    vector<result_type> densities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
piecewise_constant_distribution();
```

3 *Effects*: Constructs a `piecewise_constant_distribution` object with $n = 1$, $\rho_0 = 1$, $b_0 = 0$, and $b_1 = 1$.

```
template<class InputIteratorB, class InputIteratorW>
 piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                 InputIteratorW firstW);
```

4 *Mandates*: Both of

(4.1) — `is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>`

(4.2) — `is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>`

are `true`.

5 *Preconditions*: `InputIteratorB` and `InputIteratorW` each meet the *Cpp17InputIterator* requirements (23.3.5.3). If `firstB == lastB` or `++firstB == lastB`, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, $[\texttt{firstB}, \texttt{lastB})$ forms a sequence b of length $n + 1$, the length of the sequence w starting from `firstW` is at least n, and any w_k for $k \geq n$ are ignored by the distribution.

6 *Effects*: Constructs a `piecewise_constant_distribution` object with parameters as specified above.

```
template<class UnaryOperation>
 piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

7 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

8 *Effects*: Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: If `bl.size()` < 2, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, let $[\texttt{bl.begin()}, \texttt{bl.end()})$ form a sequence $b_0, \ldots, b_n$, and let $w_k = \texttt{fw}\big((b_{k+1} + b_k)/2\big)$ for $k = 0, \ldots, n-1$.

9 *Complexity*: The number of invocations of `fw` does not exceed n.

```
template<class UnaryOperation>
 piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

10 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

11 *Preconditions*: If $\texttt{nw} = 0$, let $n = 1$, otherwise let $n = \texttt{nw}$. The relation $0 < \delta = (\texttt{xmax} - \texttt{xmin})/n$ holds.

12 *Effects*: Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: Let $b_k = \texttt{xmin} + k \cdot \delta$ for $k = 0, \ldots, n$, and $w_k = \texttt{fw}(b_k + \delta/2)$ for $k = 0, \ldots, n-1$.

13 *Complexity*: The number of invocations of `fw` does not exceed n.

```
vector<result_type> intervals() const;
```

14 *Returns*: A `vector<result_type>` whose `size` member returns $n + 1$ and whose `operator[]` member returns b_k when invoked with argument k for $k = 0, \ldots, n$.

```
vector<result_type> densities() const;
```

15 *Returns*: A `vector<result_type>` whose `size` member returns n and whose `operator[]` member returns ρ_k when invoked with argument k for $k = 0, \ldots, n - 1$.

26.6.9.6.3 Class template `piecewise_linear_distribution` [rand.dist.samp.plinear]

1 A `piecewise_linear_distribution` random number distribution produces random numbers x, $b_0 \leq x < b_n$, distributed over each subinterval $[b_i, b_{i+1})$ according to the probability density function

$$p(x \,|\, b_0, \ldots, b_n,\ \rho_0, \ldots, \rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}\ , \text{ for } b_i \leq x < b_{i+1}.$$

2 The $n + 1$ distribution parameters b_i, also known as this distribution's *interval boundaries*, shall satisfy the relation $b_i < b_{i+1}$ for $i = 0, \ldots, n - 1$. Unless specified otherwise, the remaining $n + 1$ distribution parameters are calculated as $\rho_k = w_k/S$ for $k = 0, \ldots, n$, in which the values w_k, commonly known as the *weights at boundaries*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

$$0 < S = \frac{1}{2} \cdot \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k)\ .$$

```
template<class RealType = double>
  class piecewise_linear_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    piecewise_linear_distribution();
    template<class InputIteratorB, class InputIteratorW>
      piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                    InputIteratorW firstW);
```

```
    template<class UnaryOperation>
      piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
      piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
    explicit piecewise_linear_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    vector<result_type> intervals() const;
    vector<result_type> densities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  };
```

```
piecewise_linear_distribution();
```

3 *Effects*: Constructs a `piecewise_linear_distribution` object with $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$.

```
template<class InputIteratorB, class InputIteratorW>
 piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                               InputIteratorW firstW);
```

4 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

5 *Preconditions*: `InputIteratorB` and `InputIteratorW` each meet the *Cpp17InputIterator* requirements (23.3.5.3). If `firstB == lastB` or `++firstB == lastB`, let $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, $[\texttt{firstB}, \texttt{lastB})$ forms a sequence b of length $n + 1$, the length of the sequence w starting from `firstW` is at least $n + 1$, and any w_k for $k \geq n + 1$ are ignored by the distribution.

6 *Effects*: Constructs a `piecewise_linear_distribution` object with parameters as specified above.

```
template<class UnaryOperation>
 piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

7 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

8 *Effects*: Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: If `bl.size()` < 2, let $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, let $[\texttt{bl.begin()}, \texttt{bl.end()})$ form a sequence $b_0, \ldots, b_n$, and let $w_k = \texttt{fw}(b_k)$ for $k = 0, \ldots, n$.

9 *Complexity*: The number of invocations of `fw` does not exceed $n + 1$.

```
template<class UnaryOperation>
 piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

10 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

11 *Preconditions*: If $\texttt{nw} = 0$, let $n = 1$, otherwise let $n = \texttt{nw}$. The relation $0 < \delta = (\texttt{xmax} - \texttt{xmin})/n$ holds.

12 *Effects*: Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: Let $b_k = \texttt{xmin} + k \cdot \delta$ for $k = 0, \ldots, n$, and $w_k = \texttt{fw}(b_k)$ for $k = 0, \ldots, n$.

13 *Complexity*: The number of invocations of `fw` does not exceed $n + 1$.

```
vector<result_type> intervals() const;
```

14 *Returns*: A `vector<result_type>` whose `size` member returns $n + 1$ and whose `operator[]` member returns b_k when invoked with argument k for $k = 0, \ldots, n$.

```
vector<result_type> densities() const;
```

15 *Returns*: A `vector<result_type>` whose `size` member returns n and whose `operator[]` member returns ρ_k when invoked with argument k for $k = 0, \ldots, n$.

26.6.10 Low-quality random number generation [c.math.rand]

1 [*Note 1*: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — *end note*]

```
int rand();
void srand(unsigned int seed);
```

2 *Effects*: The `rand` and `srand` functions have the semantics specified in the C standard library.

3 *Remarks*: The implementation may specify that particular library functions may call `rand`. It is implementation-defined whether the `rand` function may introduce data races (16.4.6.10).

[*Note 2*: The other random number generation facilities in this document (26.6) are often preferable to `rand`, because `rand`'s underlying algorithm is unspecified. Use of `rand` therefore continues to be non-portable, with unpredictable and oft-questionable quality and performance. — *end note*]

  template<class T> unspecified2 end(const valarray<T>& v);
}
```

1 The header `<valarray>` defines five class templates (`valarray`, `slice_array`, `gslice_array`, `mask_array`, and `indirect_array`), two classes (`slice` and `gslice`), and a series of related function templates for representing and manipulating arrays of values.

2 The `valarray` array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.

3 Any function returning a `valarray<T>` is permitted to return an object of another type, provided all the const member functions of `valarray<T>` are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.[254]

4 Implementations introducing such replacement types shall provide additional functions and operators as follows:

(4.1) — for every function taking a `const valarray<T>&` other than `begin` and `end` (26.7.10), identical functions taking the replacement types shall be added;

(4.2) — for every function taking two `const valarray<T>&` arguments, identical functions taking every combination of `const valarray<T>&` and replacement types shall be added.

254) Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for valarray expressions.

5 In particular, an implementation shall allow a `valarray<T>` to be constructed from such replacement types and shall allow assignments and compound assignments of such types to `valarray<T>`, `slice_array<T>`, `gslice_array<T>`, `mask_array<T>` and `indirect_array<T>` objects.

6 These library functions are permitted to throw a `bad_alloc` (17.6.4.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

26.7.2 Class template valarray [template.valarray]

26.7.2.1 Overview [template.valarray.overview]

```
namespace std {
  template<class T> class valarray {
  public:
    using value_type = T;

    // 26.7.2.2, construct/destroy
    valarray();
    explicit valarray(size_t);
    valarray(const T&, size_t);
    valarray(const T*, size_t);
    valarray(const valarray&);
    valarray(valarray&&) noexcept;
    valarray(const slice_array<T>&);
    valarray(const gslice_array<T>&);
    valarray(const mask_array<T>&);
    valarray(const indirect_array<T>&);
    valarray(initializer_list<T>);
    ~valarray();

    // 26.7.2.3, assignment
    valarray& operator=(const valarray&);
    valarray& operator=(valarray&&) noexcept;
    valarray& operator=(initializer_list<T>);
    valarray& operator=(const T&);
    valarray& operator=(const slice_array<T>&);
    valarray& operator=(const gslice_array<T>&);
    valarray& operator=(const mask_array<T>&);
    valarray& operator=(const indirect_array<T>&);

    // 26.7.2.4, element access
    const T&          operator[](size_t) const;
    T&                operator[](size_t);

    // 26.7.2.5, subset operations
    valarray          operator[](slice) const;
    slice_array<T>    operator[](slice);
    valarray          operator[](const gslice&) const;
    gslice_array<T>   operator[](const gslice&);
    valarray          operator[](const valarray<bool>&) const;
    mask_array<T>     operator[](const valarray<bool>&);
    valarray          operator[](const valarray<size_t>&) const;
    indirect_array<T> operator[](const valarray<size_t>&);

    // 26.7.2.6, unary operators
    valarray operator+() const;
    valarray operator-() const;
    valarray operator~() const;
    valarray<bool> operator!() const;

    // 26.7.2.7, compound assignment
    valarray& operator*= (const T&);
    valarray& operator/= (const T&);
    valarray& operator%= (const T&);
    valarray& operator+= (const T&);
```

```
    valarray& operator-= (const T&);
    valarray& operator^= (const T&);
    valarray& operator&= (const T&);
    valarray& operator|= (const T&);
    valarray& operator<<=(const T&);
    valarray& operator>>=(const T&);

    valarray& operator*= (const valarray&);
    valarray& operator/= (const valarray&);
    valarray& operator%= (const valarray&);
    valarray& operator+= (const valarray&);
    valarray& operator-= (const valarray&);
    valarray& operator^= (const valarray&);
    valarray& operator|= (const valarray&);
    valarray& operator&= (const valarray&);
    valarray& operator<<=(const valarray&);
    valarray& operator>>=(const valarray&);

    // 26.7.2.8, member functions
    void swap(valarray&) noexcept;

    size_t size() const;

    T sum() const;
    T min() const;
    T max() const;

    valarray shift (int) const;
    valarray cshift(int) const;
    valarray apply(T func(T)) const;
    valarray apply(T func(const T&)) const;
    void resize(size_t sz, T c = T());
  };

  template<class T, size_t cnt> valarray(const T(&)[cnt], size_t) -> valarray<T>;
}
```

1 The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an “array” throughout the remainder of 26.7. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.[255]

26.7.2.2 Constructors [valarray.cons]

`valarray();`

1 *Effects*: Constructs a `valarray` that has zero length.[256]

`explicit valarray(size_t n);`

2 *Effects*: Constructs a `valarray` that has length `n`. Each element of the array is value-initialized (9.4).

`valarray(const T& v, size_t n);`

3 *Effects*: Constructs a `valarray` that has length `n`. Each element of the array is initialized with `v`.

`valarray(const T* p, size_t n);`

4 *Preconditions*: `[p, p + n)` is a valid range.

255) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.
256) This default constructor is essential, since arrays of `valarray` can be useful. After initialization, the length of an empty array can be increased with the `resize` member function.

Effects: Constructs a `valarray` that has length `n`. The values of the elements of the array are initialized with the first `n` values pointed to by the first argument.[257]

```
valarray(const valarray& v);
```

5 *Effects*: Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.[258]

```
valarray(valarray&& v) noexcept;
```

6 *Effects*: Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.

7 *Complexity*: Constant.

```
valarray(initializer_list<T> il);
```

8 *Effects*: Equivalent to `valarray(il.begin(), il.size())`.

```
valarray(const slice_array<T>&);
valarray(const gslice_array<T>&);
valarray(const mask_array<T>&);
valarray(const indirect_array<T>&);
```

9 These conversion constructors convert one of the four reference templates to a `valarray`.

```
~valarray();
```

10 *Effects*: The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

26.7.2.3 Assignment [valarray.assign]

```
valarray& operator=(const valarray& v);
```

1 *Effects*: Each element of the `*this` array is assigned the value of the corresponding element of `v`. If the length of `v` is not equal to the length of `*this`, resizes `*this` to make the two arrays the same length, as if by calling `resize(v.size())`, before performing the assignment.

2 *Postconditions*: `size() == v.size()`.

3 *Returns*: `*this`.

```
valarray& operator=(valarray&& v) noexcept;
```

4 *Effects*: `*this` obtains the value of `v`. The value of `v` after the assignment is not specified.

5 *Returns*: `*this`.

6 *Complexity*: Linear.

```
valarray& operator=(initializer_list<T> il);
```

7 *Effects*: Equivalent to: `return *this = valarray(il);`

```
valarray& operator=(const T& v);
```

8 *Effects*: Assigns `v` to each element of `*this`.

9 *Returns*: `*this`.

```
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);
```

10 *Preconditions*: The length of the array to which the argument refers equals `size()`. The value of an element in the left-hand side of a `valarray` assignment operator does not depend on the value of another element in that left-hand side.

257) This constructor is the preferred method for converting a C array to a `valarray` object.
258) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.

11 These operators allow the results of a generalized subscripting operation to be assigned directly to a `valarray`.

26.7.2.4 Element access [valarray.access]

```
const T&  operator[](size_t n) const;
T& operator[](size_t n);
```

1 *Preconditions*: `n < size()` is `true`.

2 *Returns*: A reference to the corresponding element of the array.

[*Note 1*: The expression `(a[i] = q, a[i]) == q` evaluates to `true` for any non-constant `valarray<T> a`, any `T q`, and for any `size_t i` such that the value of `i` is less than the length of `a`. — *end note*]

3 *Remarks*: The expression `addressof(a[i+j]) == addressof(a[i]) + j` evaluates to `true` for all `size_t i` and `size_t j` such that `i+j < a.size()`.

4 The expression `addressof(a[i]) != addressof(b[j])` evaluates to `true` for any two arrays `a` and `b` and for any `size_t i` and `size_t j` such that `i < a.size()` and `j < b.size()`.

[*Note 2*: This property indicates an absence of aliasing and can be used to advantage by optimizing compilers. Compilers can take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from `operator new`, and other techniques to generate efficient `valarray`s. — *end note*]

5 The reference returned by the subscript operator for an array shall be valid until the member function `resize(size_t, T)` (26.7.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

26.7.2.5 Subset operations [valarray.sub]

1 The member `operator[]` is overloaded to provide several ways to select sequences of elements from among those controlled by `*this`. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new `valarray` object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of `operator=` and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

```
valarray operator[](slice slicearr) const;
```

2 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `slicearr`.

[*Example 1*:

```
const valarray<char> v0("abcdefghijklmnop", 16);
// v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
```

— *end example*]

```
slice_array<T> operator[](slice slicearr);
```

3 *Returns*: An object that holds references to elements of the controlled sequence selected by `slicearr`.

[*Example 2*:

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
// v0 == valarray<char>("abAdeBghCjkDmnEp", 16);
```

— *end example*]

```
valarray operator[](const gslice& gslicearr) const;
```

4 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `gslicearr`.

[*Example 3*:

```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
// v0[gslice(3, len, str)] returns
// valarray<char>("dfhkmo", 6)
```

— *end example*]

```
gslice_array<T> operator[](const gslice& gslicearr);
```

5 *Returns*: An object that holds references to elements of the controlled sequence selected by `gslicearr`.

[*Example 4*:
```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDEF", 6);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
// v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
```
— *end example*]

```
valarray operator[](const valarray<bool>& boolarr) const;
```

6 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `boolarr`.

[*Example 5*:
```
const valarray<char> v0("abcdefghijklmnop", 16);
const bool vb[] = { false, false, true, true, false, true };
// v0[valarray<bool>(vb, 6)] returns
// valarray<char>("cdf", 3)
```
— *end example*]

```
mask_array<T> operator[](const valarray<bool>& boolarr);
```

7 *Returns*: An object that holds references to elements of the controlled sequence selected by `boolarr`.

[*Example 6*:
```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeCghijklmnop", 16)
```
— *end example*]

```
valarray operator[](const valarray<size_t>& indarr) const;
```

8 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `indarr`.

[*Example 7*:
```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)
```
— *end example*]

```
indirect_array<T> operator[](const valarray<size_t>& indarr);
```

9 *Returns*: An object that holds references to elements of the controlled sequence selected by `indarr`.

[*Example 8*:
```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEjklmnop", 16)
```
— *end example*]

26.7.2.6 Unary operators [valarray.unary]

```
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
```

```
valarray<bool> operator!() const;
```

1 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `T` (`bool` for `operator!`) or which may be unambiguously implicitly converted to type `T` (`bool` for `operator!`).

2 *Returns*: A `valarray` whose length is `size()`. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

26.7.2.7 Compound assignment [valarray.cassign]

```
valarray& operator*= (const valarray& v);
valarray& operator/= (const valarray& v);
valarray& operator%= (const valarray& v);
valarray& operator+= (const valarray& v);
valarray& operator-= (const valarray& v);
valarray& operator^= (const valarray& v);
valarray& operator&= (const valarray& v);
valarray& operator|= (const valarray& v);
valarray& operator<<=(const valarray& v);
valarray& operator>>=(const valarray& v);
```

1 *Mandates*: The indicated operator can be applied to two operands of type `T`.

2 *Preconditions*: `size() == v.size()` is `true`.

The value of an element in the left-hand side of a valarray compound assignment operator does not depend on the value of another element in that left hand side.

3 *Effects*: Each of these operators performs the indicated operation on each of the elements of `*this` and the corresponding element of `v`.

4 *Returns*: `*this`.

5 *Remarks*: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

```
valarray& operator*= (const T& v);
valarray& operator/= (const T& v);
valarray& operator%= (const T& v);
valarray& operator+= (const T& v);
valarray& operator-= (const T& v);
valarray& operator^= (const T& v);
valarray& operator&= (const T& v);
valarray& operator|= (const T& v);
valarray& operator<<=(const T& v);
valarray& operator>>=(const T& v);
```

6 *Mandates*: The indicated operator can be applied to two operands of type `T`.

7 *Effects*: Each of these operators applies the indicated operation to each element of `*this` and `v`.

8 *Returns*: `*this`

9 *Remarks*: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

26.7.2.8 Member functions [valarray.members]

```
void swap(valarray& v) noexcept;
```

1 *Effects*: `*this` obtains the value of `v`. `v` obtains the value of `*this`.

2 *Complexity*: Constant.

```
size_t size() const;
```

3 *Returns*: The number of elements in the array.

4 *Complexity*: Constant time.

```
T sum() const;
```

5 *Mandates*: `operator+=` can be applied to operands of type `T`.

6 *Preconditions*: `size() > 0` is `true`.

7 *Returns*: The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying `operator+=` to a copy of an element of the array and all other elements of the array in an unspecified order.

```
T min() const;
```

8 *Preconditions*: `size() > 0` is `true`.

9 *Returns*: The minimum value contained in `*this`. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using `operator<`.

```
T max() const;
```

10 *Preconditions*: `size() > 0` is `true`.

11 *Returns*: The maximum value contained in `*this`. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using `operator<`.

```
valarray shift(int n) const;
```

12 *Returns*: A `valarray` of length `size()`, each of whose elements *I* is `(*this)[`*I* `+ n]` if *I* `+ n` is non-negative and less than `size()`, otherwise `T()`.

[*Note 1*: If element zero is taken as the leftmost element, a positive value of `n` shifts the elements left `n` places, with zero fill. — *end note*]

13 [*Example 1*: If the argument has the value -2, the first two elements of the result will be value-initialized (9.4); the third element of the result will be assigned the value of the first element of the argument; etc. — *end example*]

```
valarray cshift(int n) const;
```

14 *Returns*: A `valarray` of length `size()` that is a circular shift of `*this`. If element zero is taken as the leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative value of n shifts the elements circularly right $-n$ places.

```
valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;
```

15 *Returns*: A `valarray` whose length is `size()`. Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of `*this`.

```
void resize(size_t sz, T c = T());
```

16 *Effects*: Changes the length of the `*this` array to `sz` and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

26.7.3 valarray non-member operations [valarray.nonmembers]

26.7.3.1 Binary operators [valarray.binary]

```
template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&, const valarray<T>&);
```

1 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `T` or which can be unambiguously implicitly converted to `T`.

2 *Preconditions*: The argument arrays have the same length.

3 *Returns*: A `valarray` whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<T> operator* (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator* (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator/ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator% (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator+ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator- (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator^ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator| (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator<<(const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator>>(const typename valarray<T>::value_type&,
                                         const valarray<T>&);
```

4 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `T` or which can be unambiguously implicitly converted to `T`.

5 *Returns*: A `valarray` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

26.7.3.2 Logical operators [valarray.comparison]

```
template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&, const valarray<T>&);
```

1 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

2 *Preconditions*: The two array arguments have the same length.

3 *Returns*: A `valarray<bool>` whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<bool> operator==(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator==(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator!=(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator< (const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator> (const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<=(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>=(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator||(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
```

4 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

5 *Returns*: A `valarray<bool>` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

26.7.3.3 Transcendentals [valarray.transcend]

```
template<class T> valarray<T> abs  (const valarray<T>&);
template<class T> valarray<T> acos (const valarray<T>&);
template<class T> valarray<T> asin (const valarray<T>&);
template<class T> valarray<T> atan (const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> atan2(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> cos  (const valarray<T>&);
template<class T> valarray<T> cosh (const valarray<T>&);
template<class T> valarray<T> exp  (const valarray<T>&);
template<class T> valarray<T> log  (const valarray<T>&);
template<class T> valarray<T> log10(const valarray<T>&);
template<class T> valarray<T> pow  (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow  (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> pow  (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> sin  (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
```

```
template<class T> valarray<T> tan  (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);
```

1 *Mandates*: A unique function with the indicated name can be applied (unqualified) to an operand of type `T`. This function returns a value of type `T` or which can be unambiguously implicitly converted to type `T`.

26.7.3.4 Specialized algorithms [valarray.special]

```
template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;
```

1 *Effects*: Equivalent to `x.swap(y)`.

26.7.4 Class slice [class.slice]

26.7.4.1 Overview [class.slice.overview]

```
namespace std {
  class slice {
  public:
    slice();
    slice(size_t, size_t, size_t);

    size_t start() const;
    size_t size() const;
    size_t stride() const;

    friend bool operator==(const slice& x, const slice& y);
  };
}
```

1 The `slice` class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.[259]

26.7.4.2 Constructors [cons.slice]

```
slice();
slice(size_t start, size_t length, size_t stride);
slice(const slice&);
```

1 The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.

2 [*Example 1*: `slice(3, 8, 2)` constructs a slice which selects elements $3, 5, 7, \ldots, 17$ from an array. — *end example*]

26.7.4.3 Access functions [slice.access]

```
size_t start() const;
size_t size() const;
size_t stride() const;
```

1 *Returns*: The start, length, or stride specified by a `slice` object.

2 *Complexity*: Constant time.

26.7.4.4 Operators [slice.ops]

```
friend bool operator==(const slice& x, const slice& y);
```

1 *Effects*: Equivalent to:

```
return x.start() == y.start() && x.size() == y.size() && x.stride() == y.stride();
```

259) BLAS stands for *Basic Linear Algebra Subprograms*. C++ programs can instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.

26.7.5 Class template slice_array [template.slice.array]

26.7.5.1 Overview [template.slice.array.overview]

```
namespace std {
  template<class T> class slice_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    slice_array(const slice_array&);
    ~slice_array();
    const slice_array& operator=(const slice_array&) const;
    void operator=(const T&) const;

    slice_array() = delete;      // as implied by declaring copy constructor above
  };
}
```

1 This template is a helper template used by the `slice` subscript operator

```
slice_array<T> valarray<T>::operator[](slice);
```

2 It has reference semantics to a subset of an array specified by a `slice` object.

[*Example 1*: The expression `a[slice(1, 5, 3)] = b;` has the effect of assigning the elements of `b` to a slice of the elements in `a`. For the slice shown, the elements selected from `a` are $1, 4, \ldots, 13$. — *end example*]

26.7.5.2 Assignment [slice.arr.assign]

```
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `slice_array` object refers.

26.7.5.3 Compound assignment [slice.arr.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `slice_array` object refers.

26.7.5.4 Fill function [slice.arr.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `slice_array` object refers.

26.7.6 The gslice class [class.gslice]

26.7.6.1 Overview [class.gslice.overview]

```
namespace std {
  class gslice {
  public:
    gslice();
    gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

    size_t           start() const;
    valarray<size_t> size() const;
    valarray<size_t> stride() const;
  };
}
```

1 This class represents a generalized slice out of an array. A `gslice` is defined by a starting offset (s), a set of lengths (l_j), and a set of strides (d_j). The number of lengths shall equal the number of strides.

2 A `gslice` represents a mapping from a set of indices (i_j), equal in number to the number of strides, to a single index k. It is useful for building multidimensional array classes using the `valarray` template, which is one-dimensional. The set of one-dimensional index values specified by a `gslice` are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices i_j range in value from 0 to $l_{ij} - 1$.

3 [*Example 1*: The `gslice` specification

```
start  = 3
length = {2, 4, 3}
stride = {19, 4, 1}
```

yields the sequence of one-dimensional indices

$$k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1$$

which are ordered as shown in the following table:

$$
\begin{array}{lllll}
(i_0, & i_1, & i_2, & k) & = \\
 & (0, & 0, & 0, & 3), \\
 & (0, & 0, & 1, & 4), \\
 & (0, & 0, & 2, & 5), \\
 & (0, & 1, & 0, & 7), \\
 & (0, & 1, & 1, & 8), \\
 & (0, & 1, & 2, & 9), \\
 & (0, & 2, & 0, & 11), \\
 & (0, & 2, & 1, & 12), \\
 & (0, & 2, & 2, & 13), \\
 & (0, & 3, & 0, & 15), \\
 & (0, & 3, & 1, & 16), \\
 & (0, & 3, & 2, & 17), \\
 & (1, & 0, & 0, & 22), \\
 & (1, & 0, & 1, & 23), \\
 & \ldots \\
 & (1, & 3, & 2, & 36)
\end{array}
$$

That is, the highest-ordered index turns fastest. — *end example*]

4 It is possible to have degenerate generalized slices in which an address is repeated.

5 [*Example 2*: If the stride parameters in the previous example are changed to {1, 1, 1}, the first few elements of the resulting sequence of indices will be

$$
\begin{array}{llll}
(0, & 0, & 0, & 3), \\
(0, & 0, & 1, & 4), \\
(0, & 0, & 2, & 5), \\
(0, & 1, & 0, & 4),
\end{array}
$$

(0, 1, 1, 5),
(0, 1, 2, 6),
...

— *end example*]

6 If a degenerate slice is used as the argument to the non-`const` version of `operator[](const gslice&)`, the behavior is undefined.

26.7.6.2 Constructors [gslice.cons]

```
gslice();
gslice(size_t start, const valarray<size_t>& lengths,
       const valarray<size_t>& strides);
gslice(const gslice&);
```

1 The default constructor is equivalent to `gslice(0, valarray<size_t>(), valarray<size_t>())`. The constructor with arguments builds a `gslice` based on a specification of start, lengths, and strides, as explained in the previous subclause.

26.7.6.3 Access functions [gslice.access]

```
size_t           start()  const;
valarray<size_t> size() const;
valarray<size_t> stride() const;
```

1 *Returns*: The representation of the start, lengths, or strides specified for the `gslice`.

2 *Complexity*: `start()` is constant time. `size()` and `stride()` are linear in the number of strides.

26.7.7 Class template gslice_array [template.gslice.array]

26.7.7.1 Overview [template.gslice.array.overview]

```
namespace std {
  template<class T> class gslice_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    gslice_array(const gslice_array&);
    ~gslice_array();
    const gslice_array& operator=(const gslice_array&) const;
    void operator=(const T&) const;

    gslice_array() = delete;     // as implied by declaring copy constructor above
  };
}
```

1 This template is a helper template used by the `gslice` subscript operator

```
gslice_array<T> valarray<T>::operator[](const gslice&);
```

2 It has reference semantics to a subset of an array specified by a `gslice` object. Thus, the expression `a[gslice(1, length, stride)] = b` has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

26.7.7.2 Assignment [gslice.array.assign]

```
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

26.7.7.3 Compound assignment [gslice.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` object refers.

26.7.7.4 Fill function [gslice.array.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.

26.7.8 Class template `mask_array` [template.mask.array]

26.7.8.1 Overview [template.mask.array.overview]

```
namespace std {
  template<class T> class mask_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    mask_array(const mask_array&);
    ~mask_array();
    const mask_array& operator=(const mask_array&) const;
    void operator=(const T&) const;

    mask_array() = delete;       // as implied by declaring copy constructor above
  };
}
```

1 This template is a helper template used by the mask subscript operator:

`mask_array<T> valarray<T>::operator[](const valarray<bool>&).`

2 It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is `true`).

26.7.8.2 Assignment [mask.array.assign]

```
void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `mask_array` object refers.

26.7.8.3 Compound assignment [mask.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `mask_array` object refers.

26.7.8.4 Fill function [mask.array.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.

26.7.9 Class template `indirect_array` [template.indirect.array]

26.7.9.1 Overview [template.indirect.array.overview]

```
namespace std {
  template<class T> class indirect_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    indirect_array(const indirect_array&);
    ~indirect_array();
    const indirect_array& operator=(const indirect_array&) const;
    void operator=(const T&) const;

    indirect_array() = delete;  // as implied by declaring copy constructor above
  };
}
```

1 This template is a helper template used by the indirect subscript operator

`indirect_array<T> valarray<T>::operator[](const valarray<size_t>&).`

2 It has reference semantics to a subset of an array specified by an `indirect_array`. Thus, the expression `a[indirect] = b;` has the effect of assigning the elements of `b` to the elements in `a` whose indices appear in `indirect`.

26.7.9.2 Assignment [indirect.array.assign]

```
void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.

2 If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

3 [*Example 1*:

```
int addr[] = {2, 3, 1, 4, 4};
valarray<size_t> indirect(addr, 5);
valarray<double> a(0., 10), b(1., 5);
a[indirect] = b;
```

results in undefined behavior since element 4 is specified twice in the indirection. — *end example*]

26.7.9.3 Compound assignment [indirect.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `indirect_array` object refers.

2 If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

26.7.9.4 Fill function [indirect.array.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `indirect_array` object refers.

26.7.10 valarray range access [valarray.range]

1 In the `begin` and `end` function templates that follow, *`unspecified`*1 is a type that meets the requirements of a mutable *Cpp17RandomAccessIterator* (23.3.5.7) and models `contiguous_iterator` (23.3.4.14), whose `value_type` is the template parameter `T` and whose `reference` type is `T&`. *`unspecified`*2 is a type that meets the requirements of a constant *Cpp17RandomAccessIterator* and models `contiguous_iterator`, whose `value_type` is the template parameter `T` and whose `reference` type is `const T&`.

2 The iterators returned by `begin` and `end` for an array are guaranteed to be valid until the member function `resize(size_t, T)` (26.7.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

```
template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
```

3 *Returns*: An iterator referencing the first value in the array.

```
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
```

4 *Returns*: An iterator referencing one past the last value in the array.

26.8 Mathematical functions for floating-point types [c.math]

```

1 The contents and meaning of the header `<cmath>` are the same as the C standard library header `<math.h>`, with the addition of a three-dimensional hypotenuse function (26.8.3) and the mathematical special functions described in 26.8.6.

[*Note 1*: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2). — *end note*]

2 For each set of overloaded functions within `<cmath>`, with the exception of `abs`, there shall be additional overloads sufficient to ensure:

(2.1) — If any argument of arithmetic type corresponding to a `double` parameter has type `long double`, then all arguments of arithmetic type (6.8.2) corresponding to `double` parameters are effectively cast to `long double`.

(2.2) — Otherwise, if any argument of arithmetic type corresponding to a `double` parameter has type `double` or an integer type, then all arguments of arithmetic type corresponding to `double` parameters are effectively cast to `double`.

(2.3) — [*Note 2*: Otherwise, all arguments of arithmetic type corresponding to `double` parameters have type `float`. — *end note*]

[*Note 3*: `abs` is exempted from these rules in order to stay compatible with C. — *end note*]

SEE ALSO: ISO C 7.12

26.8.2 Absolute values [c.math.abs]

1 [*Note 1*: The headers `<cstdlib>` (17.2.2) and `<cmath>` (26.8.1) declare the functions described in this subclause. — *end note*]

```
int abs(int j);
long int abs(long int j);
long long int abs(long long int j);
float abs(float j);
double abs(double j);
```

```
long double abs(long double j);
```

2 *Effects*: The `abs` functions have the semantics specified in the C standard library for the functions `abs`, `labs`, `llabs`, `fabsf`, `fabs`, and `fabsl`.

3 *Remarks*: If `abs()` is called with an argument of type `X` for which `is_unsigned_v<X>` is `true` and if `X` cannot be converted to `int` by integral promotion (7.3.7), the program is ill-formed.

[*Note 2*: Arguments that can be promoted to `int` are permitted for compatibility with C. — *end note*]

SEE ALSO: ISO C 7.12.7.2, 7.22.6.1

26.8.3 Three-dimensional hypotenuse [c.math.hypot3]

```
float hypot(float x, float y, float z);
double hypot(double x, double y, double z);
long double hypot(long double x, long double y, long double z);
```

1 *Returns*: $\sqrt{x^2 + y^2 + z^2}$.

26.8.4 Linear interpolation [c.math.lerp]

```
constexpr float lerp(float a, float b, float t) noexcept;
constexpr double lerp(double a, double b, double t) noexcept;
constexpr long double lerp(long double a, long double b, long double t) noexcept;
```

1 *Returns*: $a + t(b - a)$.

2 *Remarks*: Let `r` be the value returned. If `isfinite(a) && isfinite(b)`, then:

(2.1) — If `t == 0`, then `r == a`.

(2.2) — If `t == 1`, then `r == b`.

(2.3) — If `t >= 0 && t <= 1`, then `isfinite(r)`.

(2.4) — If `isfinite(t) && a == b`, then `r == a`.

(2.5) — If `isfinite(t) || !isnan(t) && b-a != 0`, then `!isnan(r)`.

Let *`CMP`*`(x,y)` be `1` if `x > y`, `-1` if `x < y`, and `0` otherwise. For any `t1` and `t2`, the product of *`CMP`*`(lerp(a, b, t2), lerp(a, b, t1))`, *`CMP`*`(t2, t1)`, and *`CMP`*`(b, a)` is non-negative.

26.8.5 Classification / comparison functions [c.math.fpclass]

1 The classification / comparison functions behave the same as the C macros with the corresponding names defined in the C standard library. Each function is overloaded for the three floating-point types.

SEE ALSO: ISO C 7.12.3, 7.12.4

26.8.6 Mathematical special functions [sf.cmath]

26.8.6.1 General [sf.cmath.general]

1 If any argument value to any of the functions specified in 26.8.6 is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:

(1.1) — the function description's *Returns*: element explicitly specifies a domain and those argument values fall outside the specified domain, or

(1.2) — the corresponding mathematical function value has a nonzero imaginary component, or

(1.3) — the corresponding mathematical function is not mathematically defined.[260]

2 Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

26.8.6.2 Associated Laguerre polynomials [sf.cmath.assoc.laguerre]

```
double      assoc_laguerre(unsigned n, unsigned m, double x);
float       assoc_laguerref(unsigned n, unsigned m, float x);
```

260) A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.

```
long double  assoc_laguerrel(unsigned n, unsigned m, long double x);
```

1 *Effects*: These functions compute the associated Laguerre polynomials of their respective arguments `n`, `m`, and `x`.

2 *Returns*:

$$\mathsf{L}_n^m(x) = (-1)^m \frac{\mathsf{d}^m}{\mathsf{d}x^m} \mathsf{L}_{n+m}(x) , \quad \text{for } x \geq 0,$$

where n is `n`, m is `m`, and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128` or if `m >= 128`.

26.8.6.3 Associated Legendre functions [sf.cmath.assoc.legendre]

```
double       assoc_legendre(unsigned l, unsigned m, double x);
float        assoc_legendref(unsigned l, unsigned m, float x);
long double  assoc_legendrel(unsigned l, unsigned m, long double x);
```

1 *Effects*: These functions compute the associated Legendre functions of their respective arguments `l`, `m`, and `x`.

2 *Returns*:

$$\mathsf{P}_\ell^m(x) = (1 - x^2)^{m/2} \frac{\mathsf{d}^m}{\mathsf{d}x^m} \mathsf{P}_\ell(x) , \quad \text{for } |x| \leq 1,$$

where l is `l`, m is `m`, and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `l >= 128`.

26.8.6.4 Beta function [sf.cmath.beta]

```
double       beta(double x, double y);
float        betaf(float x, float y);
long double  betal(long double x, long double y);
```

1 *Effects*: These functions compute the beta function of their respective arguments `x` and `y`.

2 *Returns*:

$$\mathsf{B}(x, y) = \frac{\Gamma(x)\,\Gamma(y)}{\Gamma(x+y)} , \quad \text{for } x > 0,\ y > 0,$$

where x is `x` and y is `y`.

26.8.6.5 Complete elliptic integral of the first kind [sf.cmath.comp.ellint.1]

```
double       comp_ellint_1(double k);
float        comp_ellint_1f(float k);
long double  comp_ellint_1l(long double k);
```

1 *Effects*: These functions compute the complete elliptic integral of the first kind of their respective arguments `k`.

2 *Returns*:

$$\mathsf{K}(k) = \mathsf{F}(k, \pi/2) , \quad \text{for } |k| \leq 1,$$

where k is `k`.

3 See also 26.8.6.12.

26.8.6.6 Complete elliptic integral of the second kind [sf.cmath.comp.ellint.2]

```
double       comp_ellint_2(double k);
float        comp_ellint_2f(float k);
long double  comp_ellint_2l(long double k);
```

1 *Effects*: These functions compute the complete elliptic integral of the second kind of their respective arguments `k`.

2 *Returns*:

$$\mathsf{E}(k) = \mathsf{E}(k, \pi/2) , \quad \text{for } |k| \leq 1,$$

where k is `k`.

3 See also 26.8.6.13.

26.8.6.7 Complete elliptic integral of the third kind [sf.cmath.comp.ellint.3]

```
double       comp_ellint_3(double k, double nu);
float        comp_ellint_3f(float k, float nu);
long double  comp_ellint_3l(long double k, long double nu);
```

1 *Effects*: These functions compute the complete elliptic integral of the third kind of their respective arguments `k` and `nu`.

2 *Returns*:

$$\Pi(\nu, k) = \Pi(\nu, k, \pi/2)\ , \quad \text{for } |k| \leq 1,$$

where k is `k` and ν is `nu`.

3 See also 26.8.6.14.

26.8.6.8 Regular modified cylindrical Bessel functions [sf.cmath.cyl.bessel.i]

```
double       cyl_bessel_i(double nu, double x);
float        cyl_bessel_if(float nu, float x);
long double  cyl_bessel_il(long double nu, long double x);
```

1 *Effects*: These functions compute the regular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

2 *Returns*:

$$\mathsf{I}_\nu(x) = \mathrm{i}^{-\nu}\mathsf{J}_\nu(\mathrm{i}x) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k!\,\Gamma(\nu+k+1)}\ , \quad \text{for } x \geq 0,$$

where ν is `nu` and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 26.8.6.9.

26.8.6.9 Cylindrical Bessel functions of the first kind [sf.cmath.cyl.bessel.j]

```
double       cyl_bessel_j(double nu, double x);
float        cyl_bessel_jf(float nu, float x);
long double  cyl_bessel_jl(long double nu, long double x);
```

1 *Effects*: These functions compute the cylindrical Bessel functions of the first kind of their respective arguments `nu` and `x`.

2 *Returns*:

$$\mathsf{J}_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k!\,\Gamma(\nu+k+1)}\ , \quad \text{for } x \geq 0,$$

where ν is `nu` and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

26.8.6.10 Irregular modified cylindrical Bessel functions [sf.cmath.cyl.bessel.k]

```
double       cyl_bessel_k(double nu, double x);
float        cyl_bessel_kf(float nu, float x);
long double  cyl_bessel_kl(long double nu, long double x);
```

1 *Effects*: These functions compute the irregular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

2 *Returns*:

$$\mathsf{K}_\nu(x) = (\pi/2)\mathrm{i}^{\nu+1}(\mathsf{J}_\nu(\mathrm{i}x) + \mathrm{i}\mathsf{N}_\nu(\mathrm{i}x)) = \begin{cases} \dfrac{\pi}{2}\dfrac{\mathsf{I}_{-\nu}(x) - \mathsf{I}_\nu(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\[2ex] \dfrac{\pi}{2}\lim\limits_{\mu\to\nu}\dfrac{\mathsf{I}_{-\mu}(x) - \mathsf{I}_\mu(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where ν is `nu` and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 26.8.6.8, 26.8.6.9, 26.8.6.11.

26.8.6.11 Cylindrical Neumann functions [sf.cmath.cyl.neumann]

```
double      cyl_neumann(double nu, double x);
float       cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

1 *Effects*: These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments `nu` and `x`.

2 *Returns*:

$$\mathsf{N}_\nu(x) = \begin{cases} \dfrac{\mathsf{J}_\nu(x)\cos\nu\pi - \mathsf{J}_{-\nu}(x)}{\sin\nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \lim\limits_{\mu\to\nu} \dfrac{\mathsf{J}_\mu(x)\cos\mu\pi - \mathsf{J}_{-\mu}(x)}{\sin\mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where ν is `nu` and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 26.8.6.9.

26.8.6.12 Incomplete elliptic integral of the first kind [sf.cmath.ellint.1]

```
double      ellint_1(double k, double phi);
float       ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
```

1 *Effects*: These functions compute the incomplete elliptic integral of the first kind of their respective arguments `k` and `phi` (`phi` measured in radians).

2 *Returns*:

$$\mathsf{F}(k,\phi) = \int_0^\phi \frac{\mathsf{d}\theta}{\sqrt{1-k^2\sin^2\theta}}\ , \quad \text{for } |k| \leq 1,$$

where k is `k` and ϕ is `phi`.

26.8.6.13 Incomplete elliptic integral of the second kind [sf.cmath.ellint.2]

```
double      ellint_2(double k, double phi);
float       ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
```

1 *Effects*: These functions compute the incomplete elliptic integral of the second kind of their respective arguments `k` and `phi` (`phi` measured in radians).

2 *Returns*:

$$\mathsf{E}(k,\phi) = \int_0^\phi \sqrt{1-k^2\sin^2\theta}\,\mathsf{d}\theta\ , \quad \text{for } |k| \leq 1,$$

where k is `k` and ϕ is `phi`.

26.8.6.14 Incomplete elliptic integral of the third kind [sf.cmath.ellint.3]

```
double      ellint_3(double k, double nu, double phi);
float       ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
```

1 *Effects*: These functions compute the incomplete elliptic integral of the third kind of their respective arguments `k`, `nu`, and `phi` (`phi` measured in radians).

2 *Returns*:

$$\mathsf{\Pi}(\nu,k,\phi) = \int_0^\phi \frac{\mathsf{d}\theta}{(1-\nu\sin^2\theta)\sqrt{1-k^2\sin^2\theta}}\ , \quad \text{for } |k| \leq 1,$$

where ν is `nu`, k is `k`, and ϕ is `phi`.

26.8.6.15 Exponential integral [sf.cmath.expint]

```
double      expint(double x);
float       expintf(float x);
long double expintl(long double x);
```

1 *Effects*: These functions compute the exponential integral of their respective arguments `x`.

2 *Returns*:

$$\mathsf{Ei}(x) = -\int_{-x}^{\infty} \frac{e^{-t}}{t}\,\mathsf{d}t$$

where x is `x`.

26.8.6.16 Hermite polynomials [sf.cmath.hermite]

```
double      hermite(unsigned n, double x);
float       hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

1 *Effects*: These functions compute the Hermite polynomials of their respective arguments `n` and `x`.

2 *Returns*:

$$\mathsf{H}_n(x) = (-1)^n e^{x^2} \frac{\mathsf{d}^n}{\mathsf{d}x^n}\, e^{-x^2}$$

where n is `n` and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

26.8.6.17 Laguerre polynomials [sf.cmath.laguerre]

```
double      laguerre(unsigned n, double x);
float       laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

1 *Effects*: These functions compute the Laguerre polynomials of their respective arguments `n` and `x`.

2 *Returns*:

$$\mathsf{L}_n(x) = \frac{e^x}{n!} \frac{\mathsf{d}^n}{\mathsf{d}x^n}\,(x^n e^{-x})\ , \quad \text{for } x \ge 0,$$

where n is `n` and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

26.8.6.18 Legendre polynomials [sf.cmath.legendre]

```
double      legendre(unsigned l, double x);
float       legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

1 *Effects*: These functions compute the Legendre polynomials of their respective arguments `l` and `x`.

2 *Returns*:

$$\mathsf{P}_\ell(x) = \frac{1}{2^\ell\,\ell!} \frac{\mathsf{d}^\ell}{\mathsf{d}x^\ell}\,(x^2-1)^\ell\ , \quad \text{for } |x| \le 1,$$

where l is `l` and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `l >= 128`.

26.8.6.19 Riemann zeta function [sf.cmath.riemann.zeta]

```
double      riemann_zeta(double x);
float       riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

1 *Effects*: These functions compute the Riemann zeta function of their respective arguments `x`.

2 *Returns*:

$$\zeta(x) = \begin{cases} \displaystyle\sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\ \displaystyle\frac{1}{1-2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \le x \le 1 \\ 2^x \pi^{x-1} \sin(\frac{\pi x}{2})\, \Gamma(1-x)\, \zeta(1-x), & \text{for } x < 0 \end{cases}$$

where x is `x`.

26.8.6.20 Spherical Bessel functions of the first kind [sf.cmath.sph.bessel]

```
double      sph_bessel(unsigned n, double x);
float       sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

1 *Effects*: These functions compute the spherical Bessel functions of the first kind of their respective arguments `n` and `x`.

2 *Returns*:

$$\mathsf{j}_n(x) = (\pi/2x)^{1/2} \mathsf{J}_{n+1/2}(x)\ , \quad \text{for } x \ge 0,$$

where n is `n` and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

4 See also 26.8.6.9.

26.8.6.21 Spherical associated Legendre functions [sf.cmath.sph.legendre]

```
double      sph_legendre(unsigned l, unsigned m, double theta);
float       sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

1 *Effects*: These functions compute the spherical associated Legendre functions of their respective arguments `l`, `m`, and `theta` (`theta` measured in radians).

2 *Returns*:

$$\mathsf{Y}_\ell^m(\theta, 0)$$

where

$$\mathsf{Y}_\ell^m(\theta, \phi) = (-1)^m \left[\frac{(2\ell+1)}{4\pi} \frac{(\ell-m)!}{(\ell+m)!} \right]^{1/2} \mathsf{P}_\ell^m(\cos\theta) e^{im\phi}\ , \quad \text{for } |m| \le \ell,$$

and l is `l`, m is `m`, and θ is `theta`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `l >= 128`.

4 See also 26.8.6.3.

26.8.6.22 Spherical Neumann functions [sf.cmath.sph.neumann]

```
double      sph_neumann(unsigned n, double x);
float       sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

1 *Effects*: These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments `n` and `x`.

2 *Returns*:

$$\mathsf{n}_n(x) = (\pi/2x)^{1/2} \mathsf{N}_{n+1/2}(x)\ , \quad \text{for } x \ge 0,$$

where n is `n` and x is `x`.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

4 See also 26.8.6.11.

26.9 Numbers [numbers]

26.9.1 Header <numbers> synopsis [numbers.syn]

}
```

26.9.2 Mathematical constants [math.constants]

1 The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of e, $\log_2 e$, $\log_{10} e$, π, $\frac{1}{\pi}$, $\frac{1}{\sqrt{\pi}}$, $\ln 2$, $\ln 10$, $\sqrt{2}$, $\sqrt{3}$, $\frac{1}{\sqrt{3}}$, the Euler-Mascheroni γ constant, and the golden ratio ϕ constant $\frac{1+\sqrt{5}}{2}$, respectively.

2 Pursuant to 16.4.5.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.

3 A program that instantiates a primary template of a mathematical constant variable template is ill-formed.

27 Time library [time]

27.1 General [time.general]

1 This Clause describes the chrono library (27.2) and various C functions (27.14) that provide generally useful time utilities, as summarized in Table 96.

Table 96: Time library summary [tab:time.summary]

	Subclause	Header
27.3	*Cpp17Clock* requirements	
27.4	Time-related traits	`<chrono>`
27.5	Class template `duration`	
27.6	Class template `time_point`	
27.7	Clocks	
27.8	Civil calendar	
27.9	Class template `hh_mm_ss`	
27.10	12/24 hour functions	
27.11	Time zones	
27.12	Formatting	
27.13	Parsing	
27.14	C library time utilities	`<ctime>`

2 Let *STATICALLY-WIDEN*`<charT>("...")` be `"..."` if `charT` is `char` and `L"..."` if `charT` is `wchar_t`.

27.2 Header `<chrono>` synopsis [time.syn]

```
#include <compare>              // see 17.11.1

namespace std {
  namespace chrono {
    // 27.5, class template duration
    template<class Rep, class Period = ratio<1>> class duration;

    // 27.6, class template time_point
    template<class Clock, class Duration = typename Clock::duration> class time_point;
  }

  // 27.4.3, common_type specializations
  template<class Rep1, class Period1, class Rep2, class Period2>
    struct common_type<chrono::duration<Rep1, Period1>,
                       chrono::duration<Rep2, Period2>>;

  template<class Clock, class Duration1, class Duration2>
    struct common_type<chrono::time_point<Clock, Duration1>,
                       chrono::time_point<Clock, Duration2>>;

  namespace chrono {
    // 27.4, customization traits
    template<class Rep> struct treat_as_floating_point;
    template<class Rep>
      inline constexpr bool treat_as_floating_point_v = treat_as_floating_point<Rep>::value;

    template<class Rep> struct duration_values;

    template<class T> struct is_clock;
    template<class T> inline constexpr bool is_clock_v = is_clock<T>::value;
```

```
// 27.5.6, duration arithmetic

27.3 *Cpp17Clock* requirements [time.clock.req]

1 A clock is a bundle consisting of a `duration`, a `time_point`, and a function `now()` to get the current `time_point`. The origin of the clock's `time_point` is referred to as the clock's *epoch*. A clock shall meet the requirements in Table 97.

2 In Table 97 `C1` and `C2` denote clock types. `t1` and `t2` are values returned by `C1::now()` where the call returning `t1` happens before (6.9.2) the call returning `t2` and both of these calls occur before `C1::time_point::max()`.

[*Note 1*: This means `C1` did not wrap around between `t1` and `t2`. — *end note*]

Table 97: *Cpp17Clock* requirements [tab:time.clock]

Expression	Return type	Operational semantics
`C1::rep`	An arithmetic type or a class emulating an arithmetic type	The representation type of `C1::duration`.
`C1::period`	a specialization of `ratio`	The tick period of the clock in seconds.
`C1::duration`	`chrono::duration<C1::rep, C1::period>`	The `duration` type of the clock.
`C1::time_point`	`chrono::time_point<C1>` or `chrono::time_point<C2, C1::duration>`	The `time_point` type of the clock. `C1` and `C2` shall refer to the same epoch.
`C1::is_steady`	`const bool`	`true` if `t1 <= t2` is always `true` and the time between clock ticks is constant, otherwise `false`.
`C1::now()`	`C1::time_point`	Returns a `time_point` object representing the current point in time.

3 [*Note 2*: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. — *end note*]

4 A type `TC` meets the *Cpp17TrivialClock* requirements if:

(4.1) — `TC` meets the *Cpp17Clock* requirements,

(4.2) — the types `TC::rep`, `TC::duration`, and `TC::time_point` meet the *Cpp17EqualityComparable* (Table 25) and *Cpp17LessThanComparable* (Table 26) requirements and the requirements of numeric types (26.2).

[*Note 3*: This means, in particular, that operations on these types will not throw exceptions. — *end note*]

(4.3) — lvalues of the types `TC::rep`, `TC::duration`, and `TC::time_point` are swappable (16.4.4.3),

(4.4) — the function `TC::now()` does not throw exceptions, and

(4.5) — the type `TC::time_point::clock` meets the *Cpp17TrivialClock* requirements, recursively.

27.4 Time-related traits [time.traits]

27.4.1 `treat_as_floating_point` [time.traits.is.fp]

```
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { };
```

1 The `duration` template uses the `treat_as_floating_point` trait to help determine if a `duration` object can be converted to another `duration` with a different tick `period`. If `treat_as_floating_point_v<Rep>` is `true`, then implicit conversions are allowed among `duration`s. Otherwise, the implicit convertibility depends on the tick `period`s of the `duration`s.

[*Note 1*: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If `treat_as_floating_point_v<Rep>` is `false`, `Rep` will be treated as if it behaved like an integral type for the purpose of these conversions. — *end note*]

27.4.2 duration_values [time.traits.duration.values]

```
template<class Rep>
  struct duration_values {
  public:
    static constexpr Rep zero() noexcept;
    static constexpr Rep min() noexcept;
    static constexpr Rep max() noexcept;
};
```

1 The `duration` template uses the `duration_values` trait to construct special values of the duration's representation (`Rep`). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize `duration_values` to return the indicated values.

```
static constexpr Rep zero() noexcept;
```

2 *Returns*: `Rep(0)`.

[*Note 1*: `Rep(0)` is specified instead of `Rep()` because `Rep()` can have some other meaning, such as an uninitialized value. — *end note*]

3 *Remarks*: The value returned shall be the additive identity.

```
static constexpr Rep min() noexcept;
```

4 *Returns*: `numeric_limits<Rep>::lowest()`.

5 *Remarks*: The value returned shall compare less than or equal to `zero()`.

```
static constexpr Rep max() noexcept;
```

6 *Returns*: `numeric_limits<Rep>::max()`.

7 *Remarks*: The value returned shall compare greater than `zero()`.

27.4.3 Specializations of common_type [time.traits.specializations]

```
template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
  using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};
```

1 The `period` of the `duration` indicated by this specialization of `common_type` is the greatest common divisor of `Period1` and `Period2`.

[*Note 1*: This can be computed by forming a ratio of the greatest common divisor of `Period1::num` and `Period2::num` and the least common multiple of `Period1::den` and `Period2::den`. — *end note*]

2 [*Note 2*: The `typedef` name `type` is a synonym for the `duration` with the largest tick `period` possible where both `duration` arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations can have round-off errors. — *end note*]

```
template<class Clock, class Duration1, class Duration2>
  struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
    using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
};
```

3 The common type of two `time_point` types is a `time_point` with the same clock as the two types and the common type of their two `durations`.

27.4.4 Class template is_clock [time.traits.is.clock]

```
template<class T> struct is_clock;
```

1 `is_clock` is a *Cpp17UnaryTypeTrait* (20.15.2) with a base characteristic of `true_type` if `T` meets the *Cpp17Clock* requirements (27.3), otherwise `false_type`. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the *Cpp17Clock* requirements is unspecified, except that as a minimum a type `T` shall not qualify as a *Cpp17Clock* unless it meets all of the following conditions:

(1.1) — the *qualified-id*s `T::rep`, `T::period`, `T::duration`, and `T::time_point` are valid and each denotes a type (13.10.3),

(1.2) — the expression `T::is_steady` is well-formed when treated as an unevaluated operand,

(1.3) — the expression `T::now()` is well-formed when treated as an unevaluated operand.

2 The behavior of a program that adds specializations for `is_clock` is undefined.

27.5 Class template duration [time.duration]

27.5.1 General [time.duration.general]

1 A `duration` type measures time between two points in time (`time_points`). A `duration` has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template `ratio`.

```
namespace std::chrono {
  template<class Rep, class Period = ratio<1>>
  class duration {
  public:
    using rep    = Rep;
    using period = typename Period::type;

  private:
    rep rep_;         // exposition only

  public:
    // 27.5.2, construct/copy/destroy
    constexpr duration() = default;
    template<class Rep2>
      constexpr explicit duration(const Rep2& r);
    template<class Rep2, class Period2>
      constexpr duration(const duration<Rep2, Period2>& d);
    ~duration() = default;
    duration(const duration&) = default;
    duration& operator=(const duration&) = default;

    // 27.5.3, observer
    constexpr rep count() const;

    // 27.5.4, arithmetic
    constexpr common_type_t<duration> operator+() const;
    constexpr common_type_t<duration> operator-() const;
    constexpr duration& operator++();
    constexpr duration  operator++(int);
    constexpr duration& operator--();
    constexpr duration  operator--(int);

    constexpr duration& operator+=(const duration& d);
    constexpr duration& operator-=(const duration& d);

    constexpr duration& operator*=(const rep& rhs);
    constexpr duration& operator/=(const rep& rhs);
    constexpr duration& operator%=(const rep& rhs);
    constexpr duration& operator%=(const duration& rhs);

    // 27.5.5, special values
    static constexpr duration zero() noexcept;
    static constexpr duration min() noexcept;
    static constexpr duration max() noexcept;
  };
}
```

2 `Rep` shall be an arithmetic type or a class emulating an arithmetic type. If `duration` is instantiated with a `duration` type as the argument for the template parameter `Rep`, the program is ill-formed.

3 If `Period` is not a specialization of `ratio`, the program is ill-formed. If `Period::num` is not positive, the program is ill-formed.

4 Members of `duration` do not throw exceptions other than those thrown by the indicated operations on their representations.

5 The defaulted copy constructor of duration shall be a constexpr function if and only if the required initialization of the member `rep_` for copy and move, respectively, would satisfy the requirements for a constexpr function.

6 [*Example 1*:

```
duration<long, ratio<60>> d0;        // holds a count of minutes using a long
duration<long long, milli> d1;       // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>>  d2;  // holds a count with a tick period of 1/30 of a second
                                     // (30 Hz) using a double
```

— *end example*]

27.5.2 Constructors [time.duration.cons]

```
template<class Rep2>
  constexpr explicit duration(const Rep2& r);
```

1 *Constraints*: `is_convertible_v<const Rep2&, rep>` is `true` and

(1.1) — `treat_as_floating_point_v<rep>` is `true` or

(1.2) — `treat_as_floating_point_v<Rep2>` is `false`.

[*Example 1*:

```
duration<int, milli> d(3);           // OK
duration<int, milli> d(3.5);         // error
```

— *end example*]

2 *Postconditions*: `count() == static_cast<rep>(r)`.

```
template<class Rep2, class Period2>
  constexpr duration(const duration<Rep2, Period2>& d);
```

3 *Constraints*: No overflow is induced in the conversion and `treat_as_floating_point_v<rep>` is `true` or both `ratio_divide<Period2, period>::den` is 1 and `treat_as_floating_point_v<Rep2>` is `false`.

[*Note 1*: This requirement prevents implicit truncation error when converting between integral-based `duration` types. Such a construction could easily lead to confusion about the value of the `duration`. — *end note*]

[*Example 2*:

```
duration<int, milli> ms(3);
duration<int, micro> us = ms;        // OK
duration<int, milli> ms2 = us;       // error
```

— *end example*]

4 *Effects*: Initializes `rep_` with `duration_cast<duration>(d).count()`.

27.5.3 Observer [time.duration.observer]

```
constexpr rep count() const;
```

1 *Returns*: `rep_`.

27.5.4 Arithmetic [time.duration.arithmetic]

```
constexpr common_type_t<duration> operator+() const;
```

1 *Returns*: `common_type_t<duration>(*this)`.

```
constexpr common_type_t<duration> operator-() const;
```

2 *Returns*: `common_type_t<duration>(-rep_)`.

```
constexpr duration& operator++();
```

3 *Effects*: Equivalent to: `++rep_`.

4 *Returns*: `*this`.

```
constexpr duration operator++(int);
```

5 *Effects*: Equivalent to: `return duration(rep_++);`

```
constexpr duration& operator--();
```

6 *Effects*: Equivalent to: `--rep_`.

7 *Returns*: `*this`.

```
constexpr duration operator--(int);
```

8 *Effects*: Equivalent to: `return duration(rep_--);`

```
constexpr duration& operator+=(const duration& d);
```

9 *Effects*: Equivalent to: `rep_ += d.count()`.

10 *Returns*: `*this`.

```
constexpr duration& operator-=(const duration& d);
```

11 *Effects*: Equivalent to: `rep_ -= d.count()`.

12 *Returns*: `*this`.

```
constexpr duration& operator*=(const rep& rhs);
```

13 *Effects*: Equivalent to: `rep_ *= rhs`.

14 *Returns*: `*this`.

```
constexpr duration& operator/=(const rep& rhs);
```

15 *Effects*: Equivalent to: `rep_ /= rhs`.

16 *Returns*: `*this`.

```
constexpr duration& operator%=(const rep& rhs);
```

17 *Effects*: Equivalent to: `rep_ %= rhs`.

18 *Returns*: `*this`.

```
constexpr duration& operator%=(const duration& rhs);
```

19 *Effects*: Equivalent to: `rep_ %= rhs.count()`.

20 *Returns*: `*this`.

27.5.5 Special values [time.duration.special]

```
static constexpr duration zero() noexcept;
```

1 *Returns*: `duration(duration_values<rep>::zero())`.

```
static constexpr duration min() noexcept;
```

2 *Returns*: `duration(duration_values<rep>::min())`.

```
static constexpr duration max() noexcept;
```

3 *Returns*: `duration(duration_values<rep>::max())`.

27.5.6 Non-member arithmetic [time.duration.nonmember]

1 In the function descriptions that follow, unless stated otherwise, let `CD` represent the return type of the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
    operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

2 *Returns*: `CD(CD(lhs).count() + CD(rhs).count())`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
  operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

3 *Returns*: `CD(CD(lhs).count() - CD(rhs).count())`.

```
template<class Rep1, class Period, class Rep2>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator*(const duration<Rep1, Period>& d, const Rep2& s);
```

4 *Constraints*: `is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>>` is `true`.

5 *Returns*: `CD(CD(d).count() * s)`.

```
template<class Rep1, class Rep2, class Period>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator*(const Rep1& s, const duration<Rep2, Period>& d);
```

6 *Constraints*: `is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>>` is `true`.

7 *Returns*: `d * s`.

```
template<class Rep1, class Period, class Rep2>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator/(const duration<Rep1, Period>& d, const Rep2& s);
```

8 *Constraints*: `is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>>` is `true` and `Rep2` is not a specialization of `duration`.

9 *Returns*: `CD(CD(d).count() / s)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<Rep1, Rep2>
    operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

10 Let `CD` be `common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>`.

11 *Returns*: `CD(lhs).count() / CD(rhs).count()`.

```
template<class Rep1, class Period, class Rep2>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator%(const duration<Rep1, Period>& d, const Rep2& s);
```

12 *Constraints*: `is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>>` is `true` and `Rep2` is not a specialization of `duration`.

13 *Returns*: `CD(CD(d).count() % s)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
    operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

14 *Returns*: `CD(CD(lhs).count() % CD(rhs).count())`.

27.5.7 Comparisons [time.duration.comparisons]

1 In the function descriptions that follow, `CT` represents `common_type_t<A, B>`, where `A` and `B` are the types of the two arguments to the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator==(const duration<Rep1, Period1>& lhs,
                            const duration<Rep2, Period2>& rhs);
```

2 *Returns*: `CT(lhs).count() == CT(rhs).count()`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator<(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs);
```

3 *Returns*: `CT(lhs).count() < CT(rhs).count()`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator>(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs);
```

4 *Returns*: `rhs < lhs`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator<=(const duration<Rep1, Period1>& lhs,
                            const duration<Rep2, Period2>& rhs);
```

5 *Returns*: `!(rhs < lhs)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator>=(const duration<Rep1, Period1>& lhs,
                            const duration<Rep2, Period2>& rhs);
```

6 *Returns*: `!(lhs < rhs)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
    requires three_way_comparable<typename CT::rep>
  constexpr auto operator<=>(const duration<Rep1, Period1>& lhs,
                             const duration<Rep2, Period2>& rhs);
```

7 *Returns*: `CT(lhs).count() <=> CT(rhs).count()`.

27.5.8 Conversions [time.duration.cast]

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration duration_cast(const duration<Rep, Period>& d);
```

1 *Constraints*: `ToDuration` is a specialization of `duration`.

2 *Returns*: Let `CF` be `ratio_divide<Period, typename ToDuration::period>`, and `CR` be `common_type<typename ToDuration::rep, Rep, intmax_t>::type`.

(2.1) — If `CF::num == 1` and `CF::den == 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(d.count()))
```

(2.2) — otherwise, if `CF::num != 1` and `CF::den == 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) * static_cast<CR>(CF::num)))
```

(2.3) — otherwise, if `CF::num == 1` and `CF::den != 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) / static_cast<CR>(CF::den)))
```

(2.4) — otherwise, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) * static_cast<CR>(CF::num) / static_cast<CR>(CF::den)))
```

3 [*Note 1*: This function does not use any implicit conversions; all conversions are done with `static_cast`. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step. — *end note*]

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration floor(const duration<Rep, Period>& d);
```

4 *Constraints*: `ToDuration` is a specialization of `duration`.

5 *Returns*: The greatest result `t` representable in `ToDuration` for which `t <= d`.

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration ceil(const duration<Rep, Period>& d);
```

6 *Constraints*: `ToDuration` is a specialization of `duration`.

7 *Returns*: The least result `t` representable in `ToDuration` for which `t >= d`.

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration round(const duration<Rep, Period>& d);
```

8 *Constraints*: `ToDuration` is a specialization of `duration` and `treat_as_floating_point_v<typename ToDuration::rep>` is `false`.

9 *Returns*: The value of `ToDuration` that is closest to `d`. If there are two closest values, then return the value `t` for which `t % 2 == 0`.

27.5.9 Suffixes for duration literals [time.duration.literals]

1 This subclause describes literal suffixes for constructing duration literals. The suffixes `h`, `min`, `s`, `ms`, `us`, `ns` denote duration values of the corresponding types `hours`, `minutes`, `seconds`, `milliseconds`, `microseconds`, and `nanoseconds` respectively if they are applied to *integer-literal*s.

2 If any of these suffixes are applied to a *floating-point-literal* the result is a `chrono::duration` literal with an unspecified floating-point representation.

3 If any of these suffixes are applied to an *integer-literal* and the resulting `chrono::duration` value cannot be represented in the result type because of overflow, the program is ill-formed.

4 [*Example 1*: The following code shows some duration literals.

```
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
```

—*end example*]

```
constexpr chrono::hours                                  operator""h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator""h(long double hours);
```

5 *Returns*: A `duration` literal representing `hours` hours.

```
constexpr chrono::minutes                              operator""min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator""min(long double minutes);
```

6 *Returns*: A `duration` literal representing `minutes` minutes.

```
constexpr chrono::seconds                operator""s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator""s(long double sec);
```

7 *Returns*: A `duration` literal representing `sec` seconds.

8 [*Note 1*: The same suffix `s` is used for `basic_string` but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. —*end note*]

```
constexpr chrono::milliseconds                 operator""ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator""ms(long double msec);
```

9 *Returns*: A `duration` literal representing `msec` milliseconds.

```
constexpr chrono::microseconds                 operator""us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator""us(long double usec);
```

10 *Returns*: A `duration` literal representing `usec` microseconds.

```
constexpr chrono::nanoseconds                 operator""ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator""ns(long double nsec);
```

11 *Returns*: A `duration` literal representing `nsec` nanoseconds.

27.5.10 Algorithms [time.duration.alg]

```
template<class Rep, class Period>
  constexpr duration<Rep, Period> abs(duration<Rep, Period> d);
```

1 *Constraints*: `numeric_limits<Rep>::is_signed` is `true`.

2 *Returns*: If `d >= d.zero()`, return `d`, otherwise return `-d`.

27.5.11 I/O [time.duration.io]

```
template<class charT, class traits, class Rep, class Period>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);
```

1 *Effects*: Inserts the duration `d` onto the stream `os` as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(os.flags());
s.imbue(os.getloc());
s.precision(os.precision());
s << d.count() << units-suffix;
return os << s.str();
```

where *`units-suffix`* depends on the type `Period::type` as follows:

(1.1) — If `Period::type` is `atto`, *`units-suffix`* is `"as"`.

(1.2) — Otherwise, if `Period::type` is `femto`, *`units-suffix`* is `"fs"`.

(1.3) — Otherwise, if `Period::type` is `pico`, *`units-suffix`* is `"ps"`.

(1.4) — Otherwise, if `Period::type` is `nano`, *`units-suffix`* is `"ns"`.

(1.5) — Otherwise, if `Period::type` is `micro`, it is implementation-defined whether *`units-suffix`* is `"µs"` (`"\u00b5\u0073"`) or `"us"`.

(1.6) — Otherwise, if `Period::type` is `milli`, *`units-suffix`* is `"ms"`.

(1.7) — Otherwise, if `Period::type` is `centi`, *`units-suffix`* is `"cs"`.

(1.8) — Otherwise, if `Period::type` is `deci`, *`units-suffix`* is `"ds"`.

(1.9) — Otherwise, if `Period::type` is `ratio<1>`, *`units-suffix`* is `"s"`.

(1.10) — Otherwise, if `Period::type` is `deca`, *`units-suffix`* is `"das"`.

(1.11) — Otherwise, if `Period::type` is `hecto`, *`units-suffix`* is `"hs"`.

(1.12) — Otherwise, if `Period::type` is `kilo`, *`units-suffix`* is `"ks"`.

(1.13) — Otherwise, if `Period::type` is `mega`, *`units-suffix`* is `"Ms"`.

(1.14) — Otherwise, if `Period::type` is `giga`, *`units-suffix`* is `"Gs"`.

(1.15) — Otherwise, if `Period::type` is `tera`, *`units-suffix`* is `"Ts"`.

(1.16) — Otherwise, if `Period::type` is `peta`, *`units-suffix`* is `"Ps"`.

(1.17) — Otherwise, if `Period::type` is `exa`, *`units-suffix`* is `"Es"`.

(1.18) — Otherwise, if `Period::type` is `ratio<60>`, *`units-suffix`* is `"min"`.

(1.19) — Otherwise, if `Period::type` is `ratio<3600>`, *`units-suffix`* is `"h"`.

(1.20) — Otherwise, if `Period::type` is `ratio<86400>`, *`units-suffix`* is `"d"`.

(1.21) — Otherwise, if `Period::type::den == 1`, *`units-suffix`* is `"[`*`num`*`]s"`.

(1.22) — Otherwise, *`units-suffix`* is `"[`*`num`*`/`*`den`*`]s"`.

In the list above, the use of *`num`* and *`den`* refer to the static data members of `Period::type`, which are converted to arrays of `charT` using a decimal conversion with no leading zeroes.

2 *Returns*: `os`.

```
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                duration<Rep, Period>& d,
                basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the duration `d` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse parses everything specified by the parsing format flags without error, and yet none of the flags impacts a duration, `d` will be assigned a zero value. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a

modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

4 *Returns*: `is`.

27.6 Class template `time_point` [time.point]

27.6.1 General [time.point.general]

```
namespace std::chrono {
  template<class Clock, class Duration = typename Clock::duration>
  class time_point {
  public:
    using clock    = Clock;
    using duration = Duration;
    using rep      = typename duration::rep;
    using period   = typename duration::period;

  private:
    duration d_;                                              // exposition only

  public:
    // 27.6.2, construct
    constexpr time_point();                                   // has value epoch
    constexpr explicit time_point(const duration& d);         // same as time_point() + d
    template<class Duration2>
      constexpr time_point(const time_point<clock, Duration2>& t);

    // 27.6.3, observer
    constexpr duration time_since_epoch() const;

    // 27.6.4, arithmetic
    constexpr time_point& operator++();
    constexpr time_point operator++(int);
    constexpr time_point& operator--();
    constexpr time_point operator--(int);
    constexpr time_point& operator+=(const duration& d);
    constexpr time_point& operator-=(const duration& d);

    // 27.6.5, special values
    static constexpr time_point min() noexcept;
    static constexpr time_point max() noexcept;
  };
}
```

1 `Clock` shall either meet the *Cpp17Clock* requirements (27.3) or be the type `local_t`.

2 If `Duration` is not an instance of `duration`, the program is ill-formed.

27.6.2 Constructors [time.point.cons]

```
constexpr time_point();
```

1 *Effects*: Initializes `d_` with `duration::zero()`. Such a `time_point` object represents the epoch.

```
constexpr explicit time_point(const duration& d);
```

2 *Effects*: Initializes `d_` with `d`. Such a `time_point` object represents the epoch `+ d`.

```
template<class Duration2>
  constexpr time_point(const time_point<clock, Duration2>& t);
```

3 *Constraints*: `is_convertible_v<Duration2, duration>` is `true`.

4 *Effects*: Initializes `d_` with `t.time_since_epoch()`.

27.6.3 Observer [time.point.observer]

```
constexpr duration time_since_epoch() const;
```

1 *Returns*: `d_`.

27.6.4 Arithmetic [time.point.arithmetic]

```
constexpr time_point& operator++();
```

1 *Effects*: Equivalent to: `++d_`.

2 *Returns*: `*this`.

```
constexpr time_point operator++(int);
```

3 *Effects*: Equivalent to: `return time_point{d_++};`

```
constexpr time_point& operator--();
```

4 *Effects*: Equivalent to: `--d_`.

5 *Returns*: `*this`.

```
constexpr time_point operator--(int);
```

6 *Effects*: Equivalent to: `return time_point{d_--};`

```
constexpr time_point& operator+=(const duration& d);
```

7 *Effects*: Equivalent to: `d_ += d`.

8 *Returns*: `*this`.

```
constexpr time_point& operator-=(const duration& d);
```

9 *Effects*: Equivalent to: `d_ -= d`.

10 *Returns*: `*this`.

27.6.5 Special values [time.point.special]

```
static constexpr time_point min() noexcept;
```

1 *Returns*: `time_point(duration::min())`.

```
static constexpr time_point max() noexcept;
```

2 *Returns*: `time_point(duration::max())`.

27.6.6 Non-member arithmetic [time.point.nonmember]

```
template<class Clock, class Duration1, class Rep2, class Period2>
  constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
    operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
```

1 *Returns*: `CT(lhs.time_since_epoch() + rhs)`, where `CT` is the type of the return value.

```
template<class Rep1, class Period1, class Clock, class Duration2>
  constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, Duration2>>
    operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);
```

2 *Returns*: `rhs + lhs`.

```
template<class Clock, class Duration1, class Rep2, class Period2>
  constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
    operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
```

3 *Returns*: `CT(lhs.time_since_epoch() - rhs)`, where `CT` is the type of the return value.

```
template<class Clock, class Duration1, class Duration2>
  constexpr common_type_t<Duration1, Duration2>
    operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);
```

4 *Returns*: `lhs.time_since_epoch() - rhs.time_since_epoch()`.

27.6.7 Comparisons [time.point.comparisons]

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator==(const time_point<Clock, Duration1>& lhs,
                            const time_point<Clock, Duration2>& rhs);
```

1 *Returns*: `lhs.time_since_epoch() == rhs.time_since_epoch()`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator<(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);
```

2 *Returns*: `lhs.time_since_epoch() < rhs.time_since_epoch()`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator>(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);
```

3 *Returns*: `rhs < lhs`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,
                            const time_point<Clock, Duration2>& rhs);
```

4 *Returns*: `!(rhs < lhs)`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,
                            const time_point<Clock, Duration2>& rhs);
```

5 *Returns*: `!(lhs < rhs)`.

```
template<class Clock, class Duration1,
         three_way_comparable_with<Duration1> Duration2>
  constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs,
                             const time_point<Clock, Duration2>& rhs);
```

6 *Returns*: `lhs.time_since_epoch() <=> rhs.time_since_epoch()`.

27.6.8 Conversions [time.point.cast]

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);
```

1 *Constraints*: `ToDuration` is a specialization of `duration`.

2 *Returns*:

```
time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))
```

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);
```

3 *Constraints*: `ToDuration` is a specialization of `duration`.

4 *Returns*: `time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()))`.

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);
```

5 *Constraints*: `ToDuration` is a specialization of `duration`.

6 *Returns*: `time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()))`.

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);
```

7 *Constraints*: `ToDuration` is a specialization of `duration`, and `treat_as_floating_point_v<typename ToDuration::rep>` is `false`.

8 *Returns*: `time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch()))`.

27.7 Clocks [time.clock]

27.7.1 General [time.clock.general]

1 The types defined in 27.7 meet the *Cpp17TrivialClock* requirements (27.3) unless otherwise specified.

27.7.2 Class `system_clock` [time.clock.system]

27.7.2.1 Overview [time.clock.system.overview]

```
namespace std::chrono {
  class system_clock {
  public:
    using rep        = see below;
    using period     = ratio<unspecified, unspecified>;
    using duration   = chrono::duration<rep, period>;
    using time_point = chrono::time_point<system_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now() noexcept;

    // mapping to/from C type time_t
    static time_t      to_time_t  (const time_point& t) noexcept;
    static time_point  from_time_t(time_t t) noexcept;
  };
}
```

1 Objects of type `system_clock` represent wall clock time from the system-wide realtime clock. Objects of type `sys_time<Duration>` measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as *Unix time*. This measure facilitates an efficient mapping between `sys_time` and calendar types (27.8).

[*Example 1*:
`sys_seconds{sys_days{1970y/January/1}}.time_since_epoch()` is `0s`.
`sys_seconds{sys_days{2000y/January/1}}.time_since_epoch()` is `946'684'800s`, which is `10'957 * 86'400s`.
— *end example*]

27.7.2.2 Members [time.clock.system.members]

```
using system_clock::rep = unspecified;
```

1 *Constraints*: `system_clock::duration::min() < system_clock::duration::zero()` is `true`.

[*Note 1*: This implies that `rep` is a signed type. — *end note*]

```
static time_t to_time_t(const time_point& t) noexcept;
```

2 *Returns*: A `time_t` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

```
static time_point from_time_t(time_t t) noexcept;
```

3 *Returns*: A `time_point` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

27.7.2.3 Non-member functions [time.clock.system.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);
```

1 *Constraints*: `treat_as_floating_point_v<typename Duration::rep>` is `false`, and `Duration{1} < days{1}` is `true`.

2 *Effects*: Equivalent to:

```
auto const dp = floor<days>(tp);
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{} {}"),
                    year_month_day{dp}, hh_mm_ss{tp-dp});
```

3 [*Example 1*:

```
cout << sys_seconds{0s} << '\n';                // 1970-01-01 00:00:00
cout << sys_seconds{946'684'800s} << '\n';      // 2000-01-01 00:00:00
cout << sys_seconds{946'688'523s} << '\n';      // 2000-01-01 01:02:03
```

— *end example*]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);
```

4 *Effects*: `os << year_month_day{dp}`.

5 *Returns*: `os`.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

6 *Effects*: Attempts to parse the input stream `is` into the `sys_time tp` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

7 *Returns*: `is`.

27.7.3 Class utc_clock [time.clock.utc]

27.7.3.1 Overview [time.clock.utc.overview]

```
namespace std::chrono {
  class utc_clock {
  public:
    using rep                       = a signed arithmetic type;
    using period                    = ratio<unspecified, unspecified>;
    using duration                  = chrono::duration<rep, period>;
    using time_point                = chrono::time_point<utc_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
      static sys_time<common_type_t<Duration, seconds>>
        to_sys(const utc_time<Duration>& t);
    template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
        from_sys(const sys_time<Duration>& t);
  };
}
```

1 In contrast to `sys_time`, which does not take leap seconds into account, `utc_clock` and its associated `time_point`, `utc_time`, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

[*Note 1*: The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one can add/subtract the constant `sys_days{1972y/1/1} - sys_days{1970y/1/1}` (`63'072'000s`) from the `utc_time`. — *end note*]

[*Example 1*:
`clock_cast<utc_clock>(sys_seconds{sys_days{1970y/January/1}}).time_since_epoch()` is `0s`.
`clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch()` is `946'684'822s`, which is `10'957 * 86'400s + 22s`.
— *end example*]

2 `utc_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `utc_clock::now()` does not propagate an exception.

[*Note 2*: `noexcept(from_sys(system_clock::now()))` is `false`. — *end note*]

27.7.3.2 Member functions [time.clock.utc.members]

```
static time_point now();
```

1 *Returns*: `from_sys(system_clock::now())`, or a more accurate value of `utc_time`.

```
template<class Duration>
  static sys_time<common_type_t<Duration, seconds>>
    to_sys(const utc_time<Duration>& u);
```

2 *Returns*: A `sys_time t`, such that `from_sys(t) == u` if such a mapping exists. Otherwise `u` represents a `time_point` during a positive leap second insertion, the conversion counts that leap second as not inserted, and the last representable value of `sys_time` prior to the insertion of the leap second is returned.

```
template<class Duration>
  static utc_time<common_type_t<Duration, seconds>>
    from_sys(const sys_time<Duration>& t);
```

3 *Returns*: A `utc_time u`, such that `u.time_since_epoch() - t.time_since_epoch()` is equal to the sum of leap seconds that were inserted between `t` and 1970-01-01. If `t` is exactly the date of leap second insertion, then the conversion counts that leap second as inserted.

[*Example 1*:

```
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
```

— *end example*]

27.7.3.3 Non-member functions [time.clock.utc.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(STATICALLY-WIDEN<charT>("{:%F %T}"), t);
```

2 [*Example 1*:

```
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
  cout << u << " UTC\n";
```

Produces this output:

```
2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC
2015-07-01 00:00:00.250 UTC
```

— *end example*]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the `utc_time tp` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

4 *Returns*: `is`.

```
struct leap_second_info {
  bool    is_leap_second;
  seconds elapsed;
};
```

5 The type `leap_second_info` has data members and special members specified above. It has no base classes or members other than those specified.

```
template<class Duration>
  leap_second_info get_leap_second_info(const utc_time<Duration>& ut);
```

6 *Returns*: A `leap_second_info lsi`, where `lsi.is_leap_second` is `true` if `ut` is during a positive leap second insertion, and otherwise `false`. `lsi.elapsed` is the sum of leap seconds between 1970-01-01 and `ut`. If `lsi.is_leap_second` is `true`, the leap second referred to by `ut` is included in the sum.

27.7.4 Class `tai_clock` [time.clock.tai]

27.7.4.1 Overview [time.clock.tai.overview]

```
namespace std::chrono {
  class tai_clock {
  public:
    using rep                       = a signed arithmetic type;
    using period                    = ratio<unspecified, unspecified>;
    using duration                  = chrono::duration<rep, period>;
    using time_point                = chrono::time_point<tai_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
        to_utc(const tai_time<Duration>&) noexcept;
    template<class Duration>
      static tai_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
  };
}
```

1 The clock `tai_clock` measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

2 `tai_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `tai_clock::now()` does not propagate an exception.

[*Note 1*: `noexcept(from_utc(utc_clock::now()))` is `false`. — *end note*]

27.7.4.2 Member functions [time.clock.tai.members]

```
static time_point now();
```

1 *Returns*: `from_utc(utc_clock::now())`, or a more accurate value of `tai_time`.

```
template<class Duration>
  static utc_time<common_type_t<Duration, seconds>>
    to_utc(const tai_time<Duration>& t) noexcept;
```

2 *Returns*:

```
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s
```

[*Note 1*:

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

— *end note*]

```
template<class Duration>
  static tai_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;
```

3 *Returns*:

```
tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s
```

[*Note 2*:

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

— *end note*]

27.7.4.3 Non-member functions [time.clock.tai.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(STATICALLY-WIDEN<charT>("{:%F %T}"), t);
```

2 [*Example 1*:

```
auto st = sys_days{2000y/January/1};
auto tt = clock_cast<tai_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, tt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI
```

— *end example*]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the `tai_time tp` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

4 *Returns*: `is`.

27.7.5 Class gps_clock [time.clock.gps]

27.7.5.1 Overview [time.clock.gps.overview]

```
namespace std::chrono {
  class gps_clock {
```

```
  public:
    using rep                       = a signed arithmetic type;
    using period                    = ratio<unspecified, unspecified>;
    using duration                  = chrono::duration<rep, period>;
    using time_point                = chrono::time_point<gps_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>&) noexcept;
    template<class Duration>
      static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
  };
}
```

1 The clock `gps_clock` measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from `1958y/January/1` to `1980y/January/Sunday[1]`, GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

2 `gps_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `gps_clock::now()` does not propagate an exception.

[*Note 1*: `noexcept(from_utc(utc_clock::now()))` is `false`. — *end note*]

27.7.5.2 Member functions [time.clock.gps.members]

```
static time_point now();
```

1 *Returns*: `from_utc(utc_clock::now())`, or a more accurate value of `gps_time`.

```
template<class Duration>
  static utc_time<common_type_t<Duration, seconds>>
    to_utc(const gps_time<Duration>& t) noexcept;
```

2 *Returns*:

```
gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s
```

[*Note 1*:

```
315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
```

— *end note*]

```
template<class Duration>
  static gps_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;
```

3 *Returns*:

```
gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s
```

[*Note 2*:

```
315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
```

— *end note*]

27.7.5.3 Non-member functions [time.clock.gps.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(STATICALLY-WIDEN<charT>("{:%F %T}"), t);
```

2 [*Example 1*:

```
auto st = sys_days{2000y/January/1};
auto gt = clock_cast<gps_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, gt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
```

— *end example*]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the `gps_time tp` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

4 *Returns*: `is`.

27.7.6 Type `file_clock` [time.clock.file]

27.7.6.1 Overview [time.clock.file.overview]

```
namespace std::chrono {
  using file_clock = see below;
}
```

1 `file_clock` is an alias for a type meeting the *Cpp17TrivialClock* requirements (27.3), and using a signed arithmetic type for `file_clock::rep`. `file_clock` is used to create the `time_point` system used for `file_time_type` (29.11). Its epoch is unspecified, and `noexcept(file_clock::now())` is `true`.

[*Note 1*: The type that `file_clock` denotes can be in a different namespace than `std::chrono`, such as `std::filesystem`. — *end note*]

27.7.6.2 Member functions [time.clock.file.members]

1 The type denoted by `file_clock` provides precisely one of the following two sets of static member functions:

```
template<class Duration>
  static sys_time<see below>
    to_sys(const file_time<Duration>&);
template<class Duration>
  static file_time<see below>
    from_sys(const sys_time<Duration>&);
```

or:

```
template<class Duration>
  static utc_time<see below>
    to_utc(const file_time<Duration>&);
template<class Duration>
  static file_time<see below>
    from_utc(const utc_time<Duration>&);
```

These member functions shall provide `time_point` conversions consistent with those specified by `utc_clock`, `tai_clock`, and `gps_clock`. The `Duration` of the resultant `time_point` is computed from the `Duration` of the input `time_point`.

27.7.6.3 Non-member functions [time.clock.file.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(STATICALLY-WIDEN<charT>("{:%F %T}"), t);
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

2 *Effects*: Attempts to parse the input stream `is` into the `file_time tp` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

3 *Returns*: `is`.

27.7.7 Class steady_clock [time.clock.steady]

```
namespace std::chrono {
  class steady_clock {
  public:
    using rep        = unspecified;
    using period     = ratio<unspecified, unspecified>;
    using duration   = chrono::duration<rep, period>;
    using time_point = chrono::time_point<unspecified, duration>;
    static constexpr bool is_steady = true;

    static time_point now() noexcept;
  };
}
```

1 Objects of class `steady_clock` represent clocks for which values of `time_point` never decrease as physical time advances and for which values of `time_point` advance at a steady rate relative to real time. That is, the clock may not be adjusted.

27.7.8 Class high_resolution_clock [time.clock.hires]

```
namespace std::chrono {
  class high_resolution_clock {
  public:
    using rep        = unspecified;
    using period     = ratio<unspecified, unspecified>;
    using duration   = chrono::duration<rep, period>;
    using time_point = chrono::time_point<unspecified, duration>;
    static constexpr bool is_steady = unspecified;

    static time_point now() noexcept;
  };
}
```

1 Objects of class `high_resolution_clock` represent clocks with the shortest tick period. `high_resolution_clock` may be a synonym for `system_clock` or `steady_clock`.

27.7.9 Local time [time.clock.local]

1 The family of time points denoted by `local_time<Duration>` are based on the pseudo clock `local_t`. `local_t` has no member `now()` and thus does not meet the clock requirements. Nevertheless `local_time<Duration>` serves the vital role of representing local time with respect to a not-yet-specified time zone. Aside from being able to get the current time, the complete `time_point` algebra is available for `local_time<Duration>` (just as for `sys_time<Duration>`).

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);
```

2 *Effects*:

```
os << sys_time<Duration>{lt.time_since_epoch()};
```

3 *Returns*: `os`.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

4 *Effects*: Attempts to parse the input stream `is` into the `local_time tp` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

5 *Returns*: `is`.

27.7.10 `time_point` conversions [time.clock.cast]

27.7.10.1 Class template `clock_time_conversion` [time.clock.conv]

```
namespace std::chrono {
  template<class DestClock, class SourceClock>
  struct clock_time_conversion {};
}
```

1 `clock_time_conversion` serves as a trait which can be used to specify how to convert a source `time_point` of type `time_point<SourceClock, Duration>` to a destination `time_point` of type `time_point<DestClock, Duration>` via a specialization: `clock_time_conversion<DestClock, SourceClock>`. A specialization of `clock_time_conversion<DestClock, SourceClock>` shall provide a const-qualified `operator()` that takes a parameter of type `time_point<SourceClock, Duration>` and returns a `time_point<DestClock, OtherDuration>` representing an equivalent point in time. `OtherDuration` is a `chrono::duration` whose specialization is computed from the input `Duration` in a manner which can vary for each `clock_time_conversion` specialization. A program may specialize `clock_time_conversion` if at least one of the template parameters is a user-defined clock type.

2 Several specializations are provided by the implementation, as described in 27.7.10.2, 27.7.10.3, 27.7.10.4, and 27.7.10.5.

27.7.10.2 Identity conversions [time.clock.cast.id]

```
template<class Clock>
struct clock_time_conversion<Clock, Clock> {
  template<class Duration>
    time_point<Clock, Duration>
      operator()(const time_point<Clock, Duration>& t) const;
};
```

```
template<class Duration>
  time_point<Clock, Duration>
    operator()(const time_point<Clock, Duration>& t) const;
```

1 *Returns*: `t`.

```
template<>
struct clock_time_conversion<system_clock, system_clock> {
  template<class Duration>
    sys_time<Duration>
      operator()(const sys_time<Duration>& t) const;
};
```

```
template<class Duration>
  sys_time<Duration>
    operator()(const sys_time<Duration>& t) const;
```

2 *Returns*: `t`.

```
template<>
struct clock_time_conversion<utc_clock, utc_clock> {
  template<class Duration>
    utc_time<Duration>
      operator()(const utc_time<Duration>& t) const;
};
```

```
template<class Duration>
  utc_time<Duration>
    operator()(const utc_time<Duration>& t) const;
```

3 *Returns*: `t`.

27.7.10.3 Conversions between system_clock and utc_clock [time.clock.cast.sys.utc]

```
template<>
struct clock_time_conversion<utc_clock, system_clock> {
  template<class Duration>
    utc_time<common_type_t<Duration, seconds>>
      operator()(const sys_time<Duration>& t) const;
};
```

```
template<class Duration>
  utc_time<common_type_t<Duration, seconds>>
    operator()(const sys_time<Duration>& t) const;
```

1 *Returns*: `utc_clock::from_sys(t)`.

```
template<>
struct clock_time_conversion<system_clock, utc_clock> {
  template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
      operator()(const utc_time<Duration>& t) const;
};
```

```
template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
    operator()(const utc_time<Duration>& t) const;
```

2 *Returns*: `utc_clock::to_sys(t)`.

27.7.10.4 Conversions between system_clock and other clocks [time.clock.cast.sys]

```
template<class SourceClock>
struct clock_time_conversion<system_clock, SourceClock> {
  template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
      -> decltype(SourceClock::to_sys(t));
};
```

```
template<class Duration>
  auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_sys(t));
```

1 *Constraints*: `SourceClock::to_sys(t)` is well-formed.

2 *Mandates*: `SourceClock::to_sys(t)` returns a `sys_time<Duration>`, where `Duration` is a valid `chrono::duration` specialization.

3 *Returns*: `SourceClock::to_sys(t)`.

```
template<class DestClock>
struct clock_time_conversion<DestClock, system_clock> {
  template<class Duration>
    auto operator()(const sys_time<Duration>& t) const
      -> decltype(DestClock::from_sys(t));
};
```

```
template<class Duration>
  auto operator()(const sys_time<Duration>& t) const
    -> decltype(DestClock::from_sys(t));
```

4 *Constraints*: `DestClock::from_sys(t)` is well-formed.

5 *Mandates*: `DestClock::from_sys(t)` returns a `time_point<DestClock, Duration>`, where `Duration` is a valid `chrono::duration` specialization.

6 *Returns*: `DestClock::from_sys(t)`.

27.7.10.5 Conversions between utc_clock and other clocks [time.clock.cast.utc]

```
template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
  template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
      -> decltype(SourceClock::to_utc(t));
};
```

```
template<class Duration>
  auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_utc(t));
```

1 *Constraints*: `SourceClock::to_utc(t)` is well-formed.

2 *Mandates*: `SourceClock::to_utc(t)` returns a `utc_time<Duration>`, where `Duration` is a valid `chrono::duration` specialization.

3 *Returns*: `SourceClock::to_utc(t)`.

```
template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
  template<class Duration>
    auto operator()(const utc_time<Duration>& t) const
      -> decltype(DestClock::from_utc(t));
};
```

```
template<class Duration>
  auto operator()(const utc_time<Duration>& t) const
    -> decltype(DestClock::from_utc(t));
```

4 *Constraints*: `DestClock::from_utc(t)` is well-formed.

5 *Mandates*: `DestClock::from_utc(t)` returns a `time_point<DestClock, Duration>`, where `Duration` is a valid `chrono::duration` specialization.

6 *Returns*: `DestClock::from_utc(t)`.

27.7.10.6 Function template clock_cast [time.clock.cast.fn]

```
template<class DestClock, class SourceClock, class Duration>
  auto clock_cast(const time_point<SourceClock, Duration>& t);
```

1 *Constraints*: At least one of the following clock time conversion expressions is well-formed:

(1.1) — `clock_time_conversion<DestClock, SourceClock>{}(t)`

(1.2) — `clock_time_conversion<DestClock, system_clock>{}(clock_time_conversion<system_clock, SourceClock>{}(t))`

(1.3) — `clock_time_conversion<DestClock, utc_clock>{}(clock_time_conversion<utc_clock, SourceClock>{}(t))`

(1.4) — `clock_time_conversion<DestClock, utc_clock>{}(clock_time_conversion<utc_clock, system_clock>{}(clock_time_conversion<system_clock, SourceClock>{}(t)))`

(1.5) — `clock_time_conversion<DestClock, system_clock>{}(clock_time_conversion<system_clock, utc_clock>{}(clock_time_conversion<utc_clock, SourceClock>{}(t)))`

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer `operator()` calls on `clock_time_conversion` specializations.

2 *Mandates*: Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.

3 *Returns*: The best well-formed clock time conversion expression in the above list.

27.8 The civil calendar [time.cal]

27.8.1 In general [time.cal.general]

1 The types in 27.8 describe the civil (Gregorian) calendar and its relationship to `sys_days` and `local_days`.

27.8.2 Class `last_spec` [time.cal.last]

```
namespace std::chrono {
  struct last_spec {
    explicit last_spec() = default;
  };
}
```

1 The type `last_spec` is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

27.8.3 Class `day` [time.cal.day]

27.8.3.1 Overview [time.cal.day.overview]

```
namespace std::chrono {
  class day {
    unsigned char d_;           // exposition only
  public:
    day() = default;
    constexpr explicit day(unsigned d) noexcept;

    constexpr day& operator++()    noexcept;
    constexpr day  operator++(int) noexcept;
    constexpr day& operator--()    noexcept;
    constexpr day  operator--(int) noexcept;

    constexpr day& operator+=(const days& d) noexcept;
    constexpr day& operator-=(const days& d) noexcept;

    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `day` represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `day`'s unspecified internal storage. `day` meets the *Cpp17EqualityComparable* (Table 25) and *Cpp17LessThanComparable* (Table 26) requirements, and participates in basic arithmetic with `days` objects, which represent a difference between two `day` objects.

2 `day` is a trivially copyable and standard-layout class type.

27.8.3.2 Member functions [time.cal.day.members]

`constexpr explicit day(unsigned d) noexcept;`

1 *Effects*: Initializes `d_` with `d`. The value held is unspecified if `d` is not in the range `[0, 255]`.

`constexpr day& operator++() noexcept;`

2 *Effects*: `++d_`.

3 *Returns*: `*this`.

`constexpr day operator++(int) noexcept;`

4 *Effects*: `++(*this)`.

5 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr day& operator--() noexcept;`

6 *Effects*: Equivalent to: `--d_`.

7 *Returns*: `*this`.

`constexpr day operator--(int) noexcept;`

8 *Effects*: `--(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr day& operator+=(const days& d) noexcept;
```

10 *Effects*: `*this = *this + d`.

11 *Returns*: `*this`.

```
constexpr day& operator-=(const days& d) noexcept;
```

12 *Effects*: `*this = *this - d`.

13 *Returns*: `*this`.

```
constexpr explicit operator unsigned() const noexcept;
```

14 *Returns*: `d_`.

```
constexpr bool ok() const noexcept;
```

15 *Returns*: `1 <= d_ && d_ <= 31`.

27.8.3.3 Non-member functions [time.cal.day.nonmembers]

```
constexpr bool operator==(const day& x, const day& y) noexcept;
```

1 *Returns*: `unsigned{x} == unsigned{y}`.

```
constexpr strong_ordering operator<=>(const day& x, const day& y) noexcept;
```

2 *Returns*: `unsigned{x} <=> unsigned{y}`.

```
constexpr day operator+(const day& x, const days& y) noexcept;
```

3 *Returns*: `day(unsigned{x} + y.count())`.

```
constexpr day operator+(const days& x, const day& y) noexcept;
```

4 *Returns*: `y + x`.

```
constexpr day operator-(const day& x, const days& y) noexcept;
```

5 *Returns*: `x + -y`.

```
constexpr days operator-(const day& x, const day& y) noexcept;
```

6 *Returns*: `days{int(unsigned{x}) - int(unsigned{y})}`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const day& d);
```

7 *Effects*: Equivalent to:

```
return os << (d.ok() ?
  format(STATICALLY-WIDEN<charT>("{:%d}"), d) :
  format(STATICALLY-WIDEN<charT>("{:%d} is not a valid day"), d));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                day& d, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

8 *Effects*: Attempts to parse the input stream `is` into the `day d` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid day, `is.setstate(ios_base::failbit)` is called and `d` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 *Returns*: `is`.

```
constexpr chrono::day operator""d(unsigned long long d) noexcept;
```

10 *Returns*: `day{static_cast<unsigned>(d)}`.

27.8.4 Class month [time.cal.month]

27.8.4.1 Overview [time.cal.month.overview]

```
namespace std::chrono {
  class month {
    unsigned char m_;              // exposition only
  public:
    month() = default;
    constexpr explicit month(unsigned m) noexcept;

    constexpr month& operator++()    noexcept;
    constexpr month  operator++(int) noexcept;
    constexpr month& operator--()    noexcept;
    constexpr month  operator--(int) noexcept;

    constexpr month& operator+=(const months& m) noexcept;
    constexpr month& operator-=(const months& m) noexcept;

    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month` represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `month`'s unspecified internal storage. `month` meets the *Cpp17EqualityComparable* (Table 25) and *Cpp17LessThanComparable* (Table 26) requirements, and participates in basic arithmetic with `months` objects, which represent a difference between two `month` objects.

2 `month` is a trivially copyable and standard-layout class type.

27.8.4.2 Member functions [time.cal.month.members]

`constexpr explicit month(unsigned m) noexcept;`

1 *Effects*: Initializes `m_` with `m`. The value held is unspecified if `m` is not in the range `[0, 255]`.

`constexpr month& operator++() noexcept;`

2 *Effects*: `*this += months{1}`.

3 *Returns*: `*this`.

`constexpr month operator++(int) noexcept;`

4 *Effects*: `++(*this)`.

5 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr month& operator--() noexcept;`

6 *Effects*: `*this -= months{1}`.

7 *Returns*: `*this`.

`constexpr month operator--(int) noexcept;`

8 *Effects*: `--(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr month& operator+=(const months& m) noexcept;`

10 *Effects*: `*this = *this + m`.

11 *Returns*: `*this`.

`constexpr month& operator-=(const months& m) noexcept;`

12 *Effects*: `*this = *this - m`.

13 *Returns*: `*this`.

```
constexpr explicit operator unsigned() const noexcept;
```

14 *Returns*: `m_`.

```
constexpr bool ok() const noexcept;
```

15 *Returns*: `1 <= m_ && m_ <= 12`.

27.8.4.3 Non-member functions [time.cal.month.nonmembers]

```
constexpr bool operator==(const month& x, const month& y) noexcept;
```

1 *Returns*: `unsigned{x} == unsigned{y}`.

```
constexpr strong_ordering operator<=>(const month& x, const month& y) noexcept;
```

2 *Returns*: `unsigned{x} <=> unsigned{y}`.

```
constexpr month operator+(const month& x, const months& y) noexcept;
```

3 *Returns*:

```
month{modulo(static_cast<long long>(unsigned{x}) + (y.count() - 1), 12) + 1}
```

where `modulo(n, 12)` computes the remainder of `n` divided by 12 using Euclidean division.

[*Note 1*: Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of `[0, 11]`. Assuming no overflow in the signed summation, this operation results in a `month` holding a value in the range `[1, 12]` even if `!x.ok()`. — *end note*]

[*Example 1*: `February + months{11} == January`. — *end example*]

```
constexpr month operator+(const months& x, const month& y) noexcept;
```

4 *Returns*: `y + x`.

```
constexpr month operator-(const month& x, const months& y) noexcept;
```

5 *Returns*: `x + -y`.

```
constexpr months operator-(const month& x, const month& y) noexcept;
```

6 *Returns*: If `x.ok() == true` and `y.ok() == true`, returns a value `m` in the range `[months{0}, months{11}]` satisfying `y + m == x`. Otherwise the value returned is unspecified.

[*Example 2*: `January - February == months{11}`. — *end example*]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month& m);
```

7 *Effects*: Equivalent to:

```
return os << (m.ok() ?
  format(os.getloc(), STATICALLY-WIDEN<charT>("{:%b}"), m) :
  format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid month"),
         static_cast<unsigned>(m)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                month& m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

8 *Effects*: Attempts to parse the input stream `is` into the `month` `m` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid month, `is.setstate(ios_base::failbit)` is called and `m` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 *Returns*: `is`.

27.8.5 Class year [time.cal.year]

27.8.5.1 Overview [time.cal.year.overview]

```
namespace std::chrono {
  class year {
    short y_;                   // exposition only
  public:
    year() = default;
    constexpr explicit year(int y) noexcept;

    constexpr year& operator++()    noexcept;
    constexpr year  operator++(int) noexcept;
    constexpr year& operator--()    noexcept;
    constexpr year  operator--(int) noexcept;

    constexpr year& operator+=(const years& y) noexcept;
    constexpr year& operator-=(const years& y) noexcept;

    constexpr year operator+() const noexcept;
    constexpr year operator-() const noexcept;

    constexpr bool is_leap() const noexcept;

    constexpr explicit operator int() const noexcept;
    constexpr bool ok() const noexcept;

    static constexpr year min() noexcept;
    static constexpr year max() noexcept;
  };
}
```

1 `year` represents a year in the civil calendar. It can represent values in the range `[min(), max()]`. It can be constructed with any `int` value, which will be subsequently truncated to fit into `year`'s unspecified internal storage. `year` meets the *Cpp17EqualityComparable* (Table 25) and *Cpp17LessThanComparable* (Table 26) requirements, and participates in basic arithmetic with `years` objects, which represent a difference between two `year` objects.

2 `year` is a trivially copyable and standard-layout class type.

27.8.5.2 Member functions [time.cal.year.members]

`constexpr explicit year(int y) noexcept;`

1 *Effects*: Initializes `y_` with `y`. The value held is unspecified if `y` is not in the range `[-32767, 32767]`.

`constexpr year& operator++() noexcept;`

2 *Effects*: `++y_`.

3 *Returns*: `*this`.

`constexpr year operator++(int) noexcept;`

4 *Effects*: `++(*this)`.

5 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr year& operator--() noexcept;`

6 *Effects*: `--y_`.

7 *Returns*: `*this`.

`constexpr year operator--(int) noexcept;`

8 *Effects*: `--(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr year& operator+=(const years& y) noexcept;
```

10 *Effects*: `*this = *this + y`.

11 *Returns*: `*this`.

```
constexpr year& operator-=(const years& y) noexcept;
```

12 *Effects*: `*this = *this - y`.

13 *Returns*: `*this`.

```
constexpr year operator+() const noexcept;
```

14 *Returns*: `*this`.

```
constexpr year year::operator-() const noexcept;
```

15 *Returns*: `year{-y_}`.

```
constexpr bool is_leap() const noexcept;
```

16 *Returns*: `y_ % 4 == 0 && (y_ % 100 != 0 || y_ % 400 == 0)`.

```
constexpr explicit operator int() const noexcept;
```

17 *Returns*: `y_`.

```
constexpr bool ok() const noexcept;
```

18 *Returns*: `min().y_ <= y_ && y_ <= max().y_`.

```
static constexpr year min() noexcept;
```

19 *Returns*: `year{-32767}`.

```
static constexpr year max() noexcept;
```

20 *Returns*: `year{32767}`.

27.8.5.3 Non-member functions [time.cal.year.nonmembers]

```
constexpr bool operator==(const year& x, const year& y) noexcept;
```

1 *Returns*: `int{x} == int{y}`.

```
constexpr strong_ordering operator<=>(const year& x, const year& y) noexcept;
```

2 *Returns*: `int{x} <=> int{y}`.

```
constexpr year operator+(const year& x, const years& y) noexcept;
```

3 *Returns*: `year{int{x} + y.count()}`.

```
constexpr year operator+(const years& x, const year& y) noexcept;
```

4 *Returns*: `y + x`.

```
constexpr year operator-(const year& x, const years& y) noexcept;
```

5 *Returns*: `x + -y`.

```
constexpr years operator-(const year& x, const year& y) noexcept;
```

6 *Returns*: `years{int{x} - int{y}}`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year& y);
```

7 *Effects*: Equivalent to:

```
return os << (y.ok() ?
  format(STATICALLY-WIDEN<charT>("{:%Y}"), y) :
  format(STATICALLY-WIDEN<charT>("{:%Y} is not a valid year"), y));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

8 *Effects*: Attempts to parse the input stream `is` into the `year` `y` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid year, `is.setstate(ios_base::failbit)` is called and `y` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 *Returns*: `is`.

```
constexpr chrono::year operator""y(unsigned long long y) noexcept;
```

10 *Returns*: `year{static_cast<int>(y)}`.

27.8.6 Class weekday [time.cal.wd]

27.8.6.1 Overview [time.cal.wd.overview]

```
namespace std::chrono {
  class weekday {
    unsigned char wd_;           // exposition only
  public:
    weekday() = default;
    constexpr explicit weekday(unsigned wd) noexcept;
    constexpr weekday(const sys_days& dp) noexcept;
    constexpr explicit weekday(const local_days& dp) noexcept;

    constexpr weekday& operator++()    noexcept;
    constexpr weekday  operator++(int) noexcept;
    constexpr weekday& operator--()    noexcept;
    constexpr weekday  operator--(int) noexcept;

    constexpr weekday& operator+=(const days& d) noexcept;
    constexpr weekday& operator-=(const days& d) noexcept;

    constexpr unsigned c_encoding() const noexcept;
    constexpr unsigned iso_encoding() const noexcept;
    constexpr bool ok() const noexcept;

    constexpr weekday_indexed operator[](unsigned index) const noexcept;
    constexpr weekday_last    operator[](last_spec) const noexcept;
  };
}
```

1 `weekday` represents a day of the week in the civil calendar. It normally holds values in the range `0` to `6`, corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `weekday`'s unspecified internal storage. `weekday` meets the *Cpp17EqualityComparable* (Table 25) requirements.

[*Note 1*: `weekday` is not *Cpp17LessThanComparable* because there is no universal consensus on which day is the first day of the week. `weekday`'s arithmetic operations treat the days of the week as a circular range, with no beginning and no end. — *end note*]

2 `weekday` is a trivially copyable and standard-layout class type.

27.8.6.2 Member functions [time.cal.wd.members]

```
constexpr explicit weekday(unsigned wd) noexcept;
```

1 *Effects*: Initializes `wd_` with `wd == 7 ? 0 : wd`. The value held is unspecified if `wd` is not in the range `[0, 255]`.

```
constexpr weekday(const sys_days& dp) noexcept;
```

2 *Effects*: Computes what day of the week corresponds to the `sys_days` `dp`, and initializes that day of the week in `wd_`.

3 [*Example 1*: If `dp` represents 1970-01-01, the constructed `weekday` represents Thursday by storing `4` in `wd_`. — *end example*]

```
constexpr explicit weekday(const local_days& dp) noexcept;
```

4 *Effects*: Computes what day of the week corresponds to the `local_days dp`, and initializes that day of the week in `wd_`.

5 *Postconditions*: The value is identical to that constructed from `sys_days{dp.time_since_epoch()}`.

```
constexpr weekday& operator++() noexcept;
```

6 *Effects*: `*this += days{1}`.

7 *Returns*: `*this`.

```
constexpr weekday operator++(int) noexcept;
```

8 *Effects*: `++(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr weekday& operator--() noexcept;
```

10 *Effects*: `*this -= days{1}`.

11 *Returns*: `*this`.

```
constexpr weekday operator--(int) noexcept;
```

12 *Effects*: `--(*this)`.

13 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr weekday& operator+=(const days& d) noexcept;
```

14 *Effects*: `*this = *this + d`.

15 *Returns*: `*this`.

```
constexpr weekday& operator-=(const days& d) noexcept;
```

16 *Effects*: `*this = *this - d`.

17 *Returns*: `*this`.

```
constexpr unsigned c_encoding() const noexcept;
```

18 *Returns*: `wd_`.

```
constexpr unsigned iso_encoding() const noexcept;
```

19 *Returns*: `wd_ == 0u ? 7u : wd_`.

```
constexpr bool ok() const noexcept;
```

20 *Returns*: `wd_ <= 6`.

```
constexpr weekday_indexed operator[](unsigned index) const noexcept;
```

21 *Returns*: `{*this, index}`.

```
constexpr weekday_last operator[](last_spec) const noexcept;
```

22 *Returns*: `weekday_last{*this}`.

27.8.6.3 Non-member functions [time.cal.wd.nonmembers]

```
constexpr bool operator==(const weekday& x, const weekday& y) noexcept;
```

1 *Returns*: `x.wd_ == y.wd_`.

```
constexpr weekday operator+(const weekday& x, const days& y) noexcept;
```

2 *Returns*:

```
weekday{modulo(static_cast<long long>(x.wd_) + y.count(), 7)}
```

where `modulo(n, 7)` computes the remainder of `n` divided by 7 using Euclidean division.

[*Note 1*: Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of `[0, 6]`. Assuming no overflow in the signed summation, this operation results in a `weekday` holding a value in the range `[0, 6]` even if `!x.ok()`. — *end note*]

[*Example 1*: `Monday + days{6} == Sunday`. — *end example*]

```
constexpr weekday operator+(const days& x, const weekday& y) noexcept;
```

3 *Returns*: `y + x`.

```
constexpr weekday operator-(const weekday& x, const days& y) noexcept;
```

4 *Returns*: `x + -y`.

```
constexpr days operator-(const weekday& x, const weekday& y) noexcept;
```

5 *Returns*: If `x.ok() == true` and `y.ok() == true`, returns a value `d` in the range `[days{0}, days{6}]` satisfying `y + d == x`. Otherwise the value returned is unspecified.

[*Example 2*: `Sunday - Monday == days{6}`. — *end example*]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const weekday& wd);
```

6 *Effects*: Equivalent to:

```
return os << (wd.ok() ?
  format(os.getloc(), STATICALLY-WIDEN<charT>("{:%a}"), wd) :
  format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid weekday"),
         static_cast<unsigned>(wd.wd_)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                weekday& wd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

7 *Effects*: Attempts to parse the input stream `is` into the `weekday` `wd` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid weekday, `is.setstate(ios_base::failbit)` is called and `wd` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

8 *Returns*: `is`.

27.8.7 Class `weekday_indexed` [time.cal.wdidx]

27.8.7.1 Overview [time.cal.wdidx.overview]

```
namespace std::chrono {
  class weekday_indexed {
    chrono::weekday  wd_;       // exposition only
    unsigned char    index_;    // exposition only

  public:
    weekday_indexed() = default;
    constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;

    constexpr chrono::weekday weekday() const noexcept;
    constexpr unsigned        index()   const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `weekday_indexed` represents a `weekday` and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

2 [*Note 1*: A `weekday_indexed` object can be constructed by indexing a `weekday` with an `unsigned`. — *end note*]

[*Example 1*:

```
constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
```

```
static_assert(wdi.weekday() == Sunday);
static_assert(wdi.index() == 2);
```

— *end example*]

3 `weekday_indexed` is a trivially copyable and standard-layout class type.

27.8.7.2 Member functions [time.cal.wdidx.members]

```
constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;
```

1 *Effects*: Initializes `wd_` with `wd` and `index_` with `index`. The values held are unspecified if `!wd.ok()` or `index` is not in the range `[0, 7]`.

```
constexpr chrono::weekday weekday() const noexcept;
```

2 *Returns*: `wd_`.

```
constexpr unsigned index() const noexcept;
```

3 *Returns*: `index_`.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: `wd_.ok() && 1 <= index_ && index_ <= 5`.

27.8.7.3 Non-member functions [time.cal.wdidx.nonmembers]

```
constexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;
```

1 *Returns*: `x.weekday() == y.weekday() && x.index() == y.index()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);
```

2 *Effects*: Equivalent to:

```
auto i = wdi.index();
return os << (i >= 1 && i <= 5 ?
  format(os.getloc(), STATICALLY-WIDEN<charT>("{}[{}]"), wdi.weekday(), i) :
  format(os.getloc(), STATICALLY-WIDEN<charT>("{}[{} is not a valid index]"),
         wdi.weekday(), i));
```

27.8.8 Class `weekday_last` [time.cal.wdlast]

27.8.8.1 Overview [time.cal.wdlast.overview]

```
namespace std::chrono {
  class weekday_last {
    chrono::weekday wd_;                // exposition only

    public:
    constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;

    constexpr chrono::weekday weekday() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `weekday_last` represents the last weekday of a month.

2 [*Note 1*: A `weekday_last` object can be constructed by indexing a `weekday` with `last`. — *end note*]

[*Example 1*:

```
constexpr auto wdl = Sunday[last];       // wdl is the last Sunday of an as yet unspecified month
static_assert(wdl.weekday() == Sunday);
```

— *end example*]

3 `weekday_last` is a trivially copyable and standard-layout class type.

27.8.8.2 Member functions [time.cal.wdlast.members]

```
constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
```

1 *Effects*: Initializes `wd_` with `wd`.

```
constexpr chrono::weekday weekday() const noexcept;
```

2 *Returns*: `wd_`.

```
constexpr bool ok() const noexcept;
```

3 *Returns*: `wd_.ok()`.

27.8.8.3 Non-member functions [time.cal.wdlast.nonmembers]

```
constexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;
```

1 *Returns*: `x.weekday() == y.weekday()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}[last]"), wdl.weekday());
```

27.8.9 Class month_day [time.cal.md]

27.8.9.1 Overview [time.cal.md.overview]

```
namespace std::chrono {
  class month_day {
    chrono::month m_;           // exposition only
    chrono::day   d_;           // exposition only

  public:
    month_day() = default;
    constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr chrono::day   day()   const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_day` represents a specific day of a specific month, but with an unspecified year. `month_day` meets the *Cpp17EqualityComparable* (Table 25) and *Cpp17LessThanComparable* (Table 26) requirements.

2 `month_day` is a trivially copyable and standard-layout class type.

27.8.9.2 Member functions [time.cal.md.members]

```
constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
```

1 *Effects*: Initializes `m_` with `m`, and `d_` with `d`.

```
constexpr chrono::month month() const noexcept;
```

2 *Returns*: `m_`.

```
constexpr chrono::day day() const noexcept;
```

3 *Returns*: `d_`.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: `true` if `m_.ok()` is `true`, `1d <= d_`, and `d_` is less than or equal to the number of days in month `m_`; otherwise returns `false`. When `m_ == February`, the number of days is considered to be 29.

27.8.9.3 Non-member functions [time.cal.md.nonmembers]

```
constexpr bool operator==(const month_day& x, const month_day& y) noexcept;
```

1 *Returns*: `x.month() == y.month() && x.day() == y.day()`.

```
constexpr strong_ordering operator<=>(const month_day& x, const month_day& y) noexcept;
```

2 *Effects*: Equivalent to:

```
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();
```

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_day& md);
```

3 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}"),
                    md.month(), md.day());
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                month_day& md, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

4 *Effects*: Attempts to parse the input stream `is` into the `month_day md` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid `month_day`, `is.setstate(ios_base::failbit)` is called and `md` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

5 *Returns*: `is`.

27.8.10 Class `month_day_last` [time.cal.mdlast]

```
namespace std::chrono {
  class month_day_last {
    chrono::month m_;                   // exposition only

  public:
    constexpr explicit month_day_last(const chrono::month& m) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_day_last` represents the last day of a month.

2 [*Note 1*: A `month_day_last` object can be constructed using the expression `m/last` or `last/m`, where `m` is an expression of type `month`. — *end note*]

[*Example 1*:

```
constexpr auto mdl = February/last;       // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February);
```

— *end example*]

3 `month_day_last` is a trivially copyable and standard-layout class type.

```
constexpr explicit month_day_last(const chrono::month& m) noexcept;
```

4 *Effects*: Initializes `m_` with `m`.

```
constexpr month month() const noexcept;
```

5 *Returns*: `m_`.

```
constexpr bool ok() const noexcept;
```

6 *Returns*: `m_.ok()`.

```
constexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;
```

7 *Returns*: `x.month() == y.month()`.

```
constexpr strong_ordering operator<=>(const month_day_last& x, const month_day_last& y) noexcept;
```

8 *Returns*: `x.month() <=> y.month()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);
```

9 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/last"), mdl.month());
```

27.8.11 Class `month_weekday` [time.cal.mwd]

27.8.11.1 Overview [time.cal.mwd.overview]

```
namespace std::chrono {
  class month_weekday {
    chrono::month           m_;          // exposition only
    chrono::weekday_indexed wdi_;        // exposition only
  public:
    constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

    constexpr chrono::month           month()           const noexcept;
    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_weekday` represents the n^{th} weekday of a month, of an as yet unspecified year. To do this the `month_weekday` stores a `month` and a `weekday_indexed`.

2 [*Example 1*:

```
constexpr auto mwd
    = February/Tuesday[3];              // mwd is the third Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_indexed() == Tuesday[3]);
```

— end example]

3 `month_weekday` is a trivially copyable and standard-layout class type.

27.8.11.2 Member functions [time.cal.mwd.members]

```
constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;
```

1 *Effects*: Initializes `m_` with `m`, and `wdi_` with `wdi`.

```
constexpr chrono::month month() const noexcept;
```

2 *Returns*: `m_`.

```
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
```

3 *Returns*: `wdi_`.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: `m_.ok() && wdi_.ok()`.

27.8.11.3 Non-member functions [time.cal.mwd.nonmembers]

```
constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
```

1 *Returns*: `x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}"),
                    mwd.month(), mwd.weekday_indexed());
```

27.8.12 Class month_weekday_last [time.cal.mwdlast]

27.8.12.1 Overview [time.cal.mwdlast.overview]

```
namespace std::chrono {
  class month_weekday_last {
    chrono::month        m_;     // exposition only
    chrono::weekday_last wdl_;   // exposition only
  public:
    constexpr month_weekday_last(const chrono::month& m,
                                 const chrono::weekday_last& wdl) noexcept;

    constexpr chrono::month        month()        const noexcept;
    constexpr chrono::weekday_last weekday_last() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_weekday_last` represents the last weekday of a month, of an as yet unspecified year. To do this the `month_weekday_last` stores a `month` and a `weekday_last`.

2 [*Example 1*:

```
constexpr auto mwd
    = February/Tuesday[last];    // mwd is the last Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_last() == Tuesday[last]);
```

— *end example*]

3 `month_weekday_last` is a trivially copyable and standard-layout class type.

27.8.12.2 Member functions [time.cal.mwdlast.members]

```
constexpr month_weekday_last(const chrono::month& m,
                             const chrono::weekday_last& wdl) noexcept;
```

1 *Effects*: Initializes `m_` with `m`, and `wdl_` with `wdl`.

```
constexpr chrono::month month() const noexcept;
```

2 *Returns*: `m_`.

```
constexpr chrono::weekday_last weekday_last() const noexcept;
```

3 *Returns*: `wdl_`.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: `m_.ok() && wdl_.ok()`.

27.8.12.3 Non-member functions [time.cal.mwdlast.nonmembers]

```
constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;
```

1 *Returns*: `x.month() == y.month() && x.weekday_last() == y.weekday_last()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}"),
                    mwdl.month(), mwdl.weekday_last());
```

27.8.13 Class year_month [time.cal.ym]

27.8.13.1 Overview [time.cal.ym.overview]

```
namespace std::chrono {
  class year_month {
    chrono::year  y_;           // exposition only
    chrono::month m_;           // exposition only

  public:
    year_month() = default;
    constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

    constexpr chrono::year  year()  const noexcept;
    constexpr chrono::month month() const noexcept;

    constexpr year_month& operator+=(const months& dm) noexcept;
    constexpr year_month& operator-=(const months& dm) noexcept;
    constexpr year_month& operator+=(const years& dy)  noexcept;
    constexpr year_month& operator-=(const years& dy)  noexcept;

    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month` represents a specific month of a specific year, but with an unspecified day. `year_month` is a field-based time point with a resolution of `months`. `year_month` meets the *Cpp17EqualityComparable* (Table 25) and *Cpp17LessThanComparable* (Table 26) requirements.

2 `year_month` is a trivially copyable and standard-layout class type.

27.8.13.2 Member functions [time.cal.ym.members]

```
constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;
```

1 *Effects*: Initializes `y_` with `y`, and `m_` with `m`.

```
constexpr chrono::year year() const noexcept;
```

2 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

3 *Returns*: `m_`.

```
constexpr year_month& operator+=(const months& dm) noexcept;
```

4 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

5 *Effects*: `*this = *this + dm`.

6 *Returns*: `*this`.

```
constexpr year_month& operator-=(const months& dm) noexcept;
```

7 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

8 *Effects*: `*this = *this - dm`.

9 *Returns*: `*this`.

```
constexpr year_month& operator+=(const years& dy) noexcept;
```

10 *Effects*: `*this = *this + dy`.

11 *Returns*: `*this`.

```
constexpr year_month& operator-=(const years& dy) noexcept;
```

12 *Effects*: `*this = *this - dy`.

13 *Returns*: `*this`.

```
constexpr bool ok() const noexcept;
```

14 *Returns*: `y_.ok() && m_.ok()`.

27.8.13.3 Non-member functions [time.cal.ym.nonmembers]

```
constexpr bool operator==(const year_month& x, const year_month& y) noexcept;
```

1 *Returns*: `x.year() == y.year() && x.month() == y.month()`.

```
constexpr strong_ordering operator<=>(const year_month& x, const year_month& y) noexcept;
```

2 *Effects*: Equivalent to:

```
if (auto c = x.year() <=> y.year(); c != 0) return c;
return x.month() <=> y.month();
```

```
constexpr year_month operator+(const year_month& ym, const months& dm) noexcept;
```

3 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

4 *Returns*: A `year_month` value `z` such that `z.ok() && z - ym == dm` is `true`.

5 *Complexity*: $\mathcal{O}(1)$ with respect to the value of `dm`.

```
constexpr year_month operator+(const months& dm, const year_month& ym) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

7 *Returns*: `ym + dm`.

```
constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;
```

8 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

9 *Returns*: `ym + -dm`.

```
constexpr months operator-(const year_month& x, const year_month& y) noexcept;
```

10 *Returns*:

```
x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) -
                            static_cast<int>(unsigned{y.month()})}
```

```
constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;
```

11 *Returns*: `(ym.year() + dy) / ym.month()`.

```
constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;
```

12 *Returns*: `ym + dy`.

```
constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;
```

13 *Returns*: `ym + -dy`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month& ym);
```

14 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}"),
                    ym.year(), ym.month());
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

15 *Effects*: Attempts to parse the input stream `is` into the `year_month` `ym` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid `year_month`, `is.setstate(ios_-`

base::failbit) is called and ym is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

16 *Returns*: is.

27.8.14 Class year_month_day [time.cal.ymd]

27.8.14.1 Overview [time.cal.ymd.overview]

```
namespace std::chrono {
  class year_month_day {
    chrono::year  y_;           // exposition only
    chrono::month m_;           // exposition only
    chrono::day   d_;           // exposition only

  public:
    year_month_day() = default;
    constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                             const chrono::day& d) noexcept;
    constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
    constexpr year_month_day(const sys_days& dp) noexcept;
    constexpr explicit year_month_day(const local_days& dp) noexcept;

    constexpr year_month_day& operator+=(const months& m) noexcept;
    constexpr year_month_day& operator-=(const months& m) noexcept;
    constexpr year_month_day& operator+=(const years& y)  noexcept;
    constexpr year_month_day& operator-=(const years& y)  noexcept;

    constexpr chrono::year  year()  const noexcept;
    constexpr chrono::month month() const noexcept;
    constexpr chrono::day   day()   const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 year_month_day represents a specific year, month, and day. year_month_day is a field-based time point with a resolution of days.

[*Note 1*: year_month_day supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — *end note*]

year_month_day meets the *Cpp17EqualityComparable* (Table 25) and *Cpp17LessThanComparable* (Table 26) requirements.

2 year_month_day is a trivially copyable and standard-layout class type.

27.8.14.2 Member functions [time.cal.ymd.members]

```
constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                         const chrono::day& d) noexcept;
```

1 *Effects*: Initializes y_ with y, m_ with m, and d_ with d.

```
constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
```

2 *Effects*: Initializes y_ with ymdl.year(), m_ with ymdl.month(), and d_ with ymdl.day().

[*Note 1*: This conversion from year_month_day_last to year_month_day might be more efficient than converting a year_month_day_last to a sys_days, and then converting that sys_days to a year_month_day. — *end note*]

```
constexpr year_month_day(const sys_days& dp) noexcept;
```

3 *Effects*: Constructs an object of type year_month_day that corresponds to the date represented by dp.

4 *Remarks*: For any value ymd of type year_month_day for which ymd.ok() is true, ymd == year_month_day{sys_days{ymd}} is true.

```
constexpr explicit year_month_day(const local_days& dp) noexcept;
```

5 *Effects*: Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_day& operator+=(const months& m) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

7 *Effects*: `*this = *this + m`.

8 *Returns*: `*this`.

```
constexpr year_month_day& operator-=(const months& m) noexcept;
```

9 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

10 *Effects*: `*this = *this - m`.

11 *Returns*: `*this`.

```
constexpr year_month_day& year_month_day::operator+=(const years& y) noexcept;
```

12 *Effects*: `*this = *this + y`.

13 *Returns*: `*this`.

```
constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;
```

14 *Effects*: `*this = *this - y`.

15 *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

16 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

17 *Returns*: `m_`.

```
constexpr chrono::day day() const noexcept;
```

18 *Returns*: `d_`.

```
constexpr operator sys_days() const noexcept;
```

19 *Returns*: If `ok()`, returns a `sys_days` holding a count of days from the `sys_days` epoch to `*this` (a negative value if `*this` represents a date prior to the `sys_days` epoch). Otherwise, if `y_.ok() && m_.ok()` is `true`, returns `sys_days{y_/m_/1d} + (d_ - 1d)`. Otherwise the value returned is unspecified.

20 *Remarks*: A `sys_days` in the range `[days{-12687428}, days{11248737}]` which is converted to a `year_month_day` has the same value when converted back to a `sys_days`.

21 [*Example 1*:

```
static_assert(year_month_day{sys_days{2017y/January/0}}  == 2016y/December/31);
static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);
```

— *end example*]

```
constexpr explicit operator local_days() const noexcept;
```

22 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

23 *Returns*: If `y_.ok()` is `true`, and `m_.ok()` is `true`, and `d_` is in the range `[1d, (y_/m_/last).day()]`, then returns `true`; otherwise returns `false`.

27.8.14.3 Non-member functions [time.cal.ymd.nonmembers]

```
constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;
```

1 *Returns*: `x.year() == y.year() && x.month() == y.month() && x.day() == y.day()`.

```
constexpr strong_ordering operator<=>(const year_month_day& x, const year_month_day& y) noexcept;
```

2 *Effects*: Equivalent to:

```
if (auto c = x.year() <=> y.year(); c != 0) return c;
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();
```

```
constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;
```

3 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

4 *Returns*: `(ymd.year() / ymd.month() + dm) / ymd.day()`.

5 [*Note 1*: If `ymd.day()` is in the range `[1d, 28d]`, `ok()` will return `true` for the resultant `year_month_day`. — *end note*]

```
constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

7 *Returns*: `ymd + dm`.

```
constexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;
```

8 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

9 *Returns*: `ymd + (-dm)`.

```
constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;
```

10 *Returns*: `(ymd.year() + dy) / ymd.month() / ymd.day()`.

11 [*Note 2*: If `ymd.month()` is February and `ymd.day()` is not in the range `[1d, 28d]`, `ok()` can return `false` for the resultant `year_month_day`. — *end note*]

```
constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;
```

12 *Returns*: `ymd + dy`.

```
constexpr year_month_day operator-(const year_month_day& ymd, const years& dy) noexcept;
```

13 *Returns*: `ymd + (-dy)`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);
```

14 *Effects*: Equivalent to:

```
return os << (ymd.ok() ?
  format(STATICALLY-WIDEN<charT>("{:%F}"), ymd) :
  format(STATICALLY-WIDEN<charT>("{:%F} is not a valid date"), ymd));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

15 *Effects*: Attempts to parse the input stream `is` into the `year_month_day ymd` using the format flags given in the NTCTS `fmt` as specified in 27.13. If the parse fails to decode a valid `year_month_day`, `is.setstate(ios_base::failbit)` is called and `ymd` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

16 *Returns*: `is`.

27.8.15 Class `year_month_day_last` [time.cal.ymdlast]

27.8.15.1 Overview [time.cal.ymdlast.overview]

```
namespace std::chrono {
  class year_month_day_last {
    chrono::year           y_;          // exposition only
    chrono::month_day_last mdl_;        // exposition only

  public:
    constexpr year_month_day_last(const chrono::year& y,
                                  const chrono::month_day_last& mdl) noexcept;

    constexpr year_month_day_last& operator+=(const months& m) noexcept;
    constexpr year_month_day_last& operator-=(const months& m) noexcept;
    constexpr year_month_day_last& operator+=(const years& y)  noexcept;
    constexpr year_month_day_last& operator-=(const years& y)  noexcept;

    constexpr chrono::year           year()           const noexcept;
    constexpr chrono::month          month()          const noexcept;
    constexpr chrono::month_day_last month_day_last() const noexcept;
    constexpr chrono::day            day()            const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month_day_last` represents the last day of a specific year and month. `year_month_day_last` is a field-based time point with a resolution of `days`, except that it is restricted to pointing to the last day of a year and month.

[*Note 1*: `year_month_day_last` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_day_last` meets the *Cpp17EqualityComparable* (Table 25) and *Cpp17LessThanComparable* (Table 26) requirements.

2 `year_month_day_last` is a trivially copyable and standard-layout class type.

27.8.15.2 Member functions [time.cal.ymdlast.members]

```
constexpr year_month_day_last(const chrono::year& y,
                              const chrono::month_day_last& mdl) noexcept;
```

1 *Effects*: Initializes `y_` with `y` and `mdl_` with `mdl`.

```
constexpr year_month_day_last& operator+=(const months& m) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

3 *Effects*: `*this = *this + m`.

4 *Returns*: `*this`.

```
constexpr year_month_day_last& operator-=(const months& m) noexcept;
```

5 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

6 *Effects*: `*this = *this - m`.

7 *Returns*: `*this`.

```
constexpr year_month_day_last& operator+=(const years& y) noexcept;
```

8 *Effects*: `*this = *this + y`.

9 *Returns*: `*this`.

```
constexpr year_month_day_last& operator-=(const years& y) noexcept;
```

10 *Effects*: `*this = *this - y`.

11 *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

12 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

13 *Returns*: `mdl_.month()`.

```
constexpr chrono::month_day_last month_day_last() const noexcept;
```

14 *Returns*: `mdl_`.

```
constexpr chrono::day day() const noexcept;
```

15 *Returns*: If `ok()` is `true`, returns a `day` representing the last day of the (`year`, `month`) pair represented by `*this`. Otherwise, the returned value is unspecified.

16 [*Note 1*: This value might be computed on demand. — *end note*]

```
constexpr operator sys_days() const noexcept;
```

17 *Returns*: `sys_days{year()/month()/day()}`.

```
constexpr explicit operator local_days() const noexcept;
```

18 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

19 *Returns*: `y_.ok() && mdl_.ok()`.

27.8.15.3 Non-member functions [time.cal.ymdlast.nonmembers]

```
constexpr bool operator==(const year_month_day_last& x, const year_month_day_last& y) noexcept;
```

1 *Returns*: `x.year() == y.year() && x.month_day_last() == y.month_day_last()`.

```
constexpr strong_ordering operator<=>(const year_month_day_last& x,
                                      const year_month_day_last& y) noexcept;
```

2 *Effects*: Equivalent to:

```
if (auto c = x.year() <=> y.year(); c != 0) return c;
return x.month_day_last() <=> y.month_day_last();
```

```
constexpr year_month_day_last
  operator+(const year_month_day_last& ymdl, const months& dm) noexcept;
```

3 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

4 *Returns*: `(ymdl.year() / ymdl.month() + dm) / last`.

```
constexpr year_month_day_last
  operator+(const months& dm, const year_month_day_last& ymdl) noexcept;
```

5 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

6 *Returns*: `ymdl + dm`.

```
constexpr year_month_day_last
  operator-(const year_month_day_last& ymdl, const months& dm) noexcept;
```

7 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

8 *Returns*: `ymdl + (-dm)`.

```
constexpr year_month_day_last
  operator+(const year_month_day_last& ymdl, const years& dy) noexcept;
```

9 *Returns*: `{ymdl.year()+dy, ymdl.month_day_last()}`.

```
constexpr year_month_day_last
  operator+(const years& dy, const year_month_day_last& ymdl) noexcept;
```

10 *Returns*: `ymdl + dy`.

```
constexpr year_month_day_last
  operator-(const year_month_day_last& ymdl, const years& dy) noexcept;
```

11 *Returns*: `ymdl + (-dy)`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_day_last& ymdl);
```

12 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}"),
                    ymdl.year(), ymdl.month_day_last());
```

27.8.16 Class year_month_weekday [time.cal.ymwd]

27.8.16.1 Overview [time.cal.ymwd.overview]

```
namespace std::chrono {
  class year_month_weekday {
    chrono::year            y_;         // exposition only
    chrono::month           m_;         // exposition only
    chrono::weekday_indexed wdi_;       // exposition only

  public:
    year_month_weekday() = default;
    constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                                 const chrono::weekday_indexed& wdi) noexcept;
    constexpr year_month_weekday(const sys_days& dp) noexcept;
    constexpr explicit year_month_weekday(const local_days& dp) noexcept;

    constexpr year_month_weekday& operator+=(const months& m) noexcept;
    constexpr year_month_weekday& operator-=(const months& m) noexcept;
    constexpr year_month_weekday& operator+=(const years& y)  noexcept;
    constexpr year_month_weekday& operator-=(const years& y)  noexcept;

    constexpr chrono::year            year()            const noexcept;
    constexpr chrono::month           month()           const noexcept;
    constexpr chrono::weekday         weekday()         const noexcept;
    constexpr unsigned                index()           const noexcept;
    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month_weekday` represents a specific year, month, and n^{th} weekday of the month. `year_month_weekday` is a field-based time point with a resolution of `days`.

[*Note 1*: `year_month_weekday` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_weekday` meets the *Cpp17EqualityComparable* (Table 25) requirements.

2 `year_month_weekday` is a trivially copyable and standard-layout class type.

27.8.16.2 Member functions [time.cal.ymwd.members]

```
constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                             const chrono::weekday_indexed& wdi) noexcept;
```

1 *Effects*: Initializes `y_` with `y`, `m_` with `m`, and `wdi_` with `wdi`.

```
constexpr year_month_weekday(const sys_days& dp) noexcept;
```

2 *Effects*: Constructs an object of type `year_month_weekday` which corresponds to the date represented by `dp`.

3 *Remarks*: For any value `ymdl` of type `year_month_weekday` for which `ymdl.ok()` is `true`, `ymdl == year_month_weekday{sys_days{ymdl}}` is `true`.

```
constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

4 *Effects*: Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_weekday& operator+=(const months& m) noexcept;
```

5 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

6 *Effects*: `*this = *this + m`.

7 *Returns*: `*this`.

```
constexpr year_month_weekday& operator-=(const months& m) noexcept;
```

8 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

9 *Effects*: `*this = *this - m`.

10 *Returns*: `*this`.

```
constexpr year_month_weekday& operator+=(const years& y) noexcept;
```

11 *Effects*: `*this = *this + y`.

12 *Returns*: `*this`.

```
constexpr year_month_weekday& operator-=(const years& y) noexcept;
```

13 *Effects*: `*this = *this - y`.

14 *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

15 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

16 *Returns*: `m_`.

```
constexpr chrono::weekday weekday() const noexcept;
```

17 *Returns*: `wdi_.weekday()`.

```
constexpr unsigned index() const noexcept;
```

18 *Returns*: `wdi_.index()`.

```
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
```

19 *Returns*: `wdi_`.

```
constexpr operator sys_days() const noexcept;
```

20 *Returns*: If `y_.ok() && m_.ok() && wdi_.weekday().ok()`, returns a `sys_days` that represents the date `(index() - 1) * 7` days after the first `weekday()` of `year()/month()`. If `index()` is 0 the returned `sys_days` represents the date 7 days prior to the first `weekday()` of `year()/month()`. Otherwise the returned value is unspecified.

```
constexpr explicit operator local_days() const noexcept;
```

21 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

22 *Returns*: If any of `y_.ok()`, `m_.ok()`, or `wdi_.ok()` is `false`, returns `false`. Otherwise, if `*this` represents a valid date, returns `true`. Otherwise, returns `false`.

27.8.16.3 Non-member functions [time.cal.ymwd.nonmembers]

```
constexpr bool operator==(const year_month_weekday& x, const year_month_weekday& y) noexcept;
```

1 *Returns*:

```
x.year() == y.year() && x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()
```

```
constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const months& dm) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

3 *Returns*: `(ymwd.year() / ymwd.month() + dm) / ymwd.weekday_indexed()`.

```
constexpr year_month_weekday operator+(const months& dm, const year_month_weekday& ymwd) noexcept;
```

4 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

5 *Returns*: `ymwd + dm`.

```
constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const months& dm) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

7 *Returns*: `ymwd + (-dm)`.

```
constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const years& dy) noexcept;
```

8 *Returns*: `{ymwd.year()+dy, ymwd.month(), ymwd.weekday_indexed()}`.

```
constexpr year_month_weekday operator+(const years& dy, const year_month_weekday& ymwd) noexcept;
```

9 *Returns*: `ymwd + dy`.

```
constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const years& dy) noexcept;
```

10 *Returns*: `ymwd + (-dy)`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_weekday& ymwd);
```

11 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}/{}"),
                    ymwd.year(), ymwd.month(), ymwd.weekday_indexed());
```

27.8.17 Class year_month_weekday_last [time.cal.ymwdlast]

27.8.17.1 Overview [time.cal.ymwdlast.overview]

```
namespace std::chrono {
  class year_month_weekday_last {
    chrono::year         y_;    // exposition only
    chrono::month        m_;    // exposition only
    chrono::weekday_last wdl_;  // exposition only

  public:
    constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
                                      const chrono::weekday_last& wdl) noexcept;
```

```
    constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
    constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
    constexpr year_month_weekday_last& operator+=(const years& y)  noexcept;
    constexpr year_month_weekday_last& operator-=(const years& y)  noexcept;

    constexpr chrono::year         year()         const noexcept;
    constexpr chrono::month        month()        const noexcept;
    constexpr chrono::weekday      weekday()      const noexcept;
    constexpr chrono::weekday_last weekday_last() const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month_weekday_last` represents a specific year, month, and last weekday of the month. `year_month_weekday_last` is a field-based time point with a resolution of `days`, except that it is restricted to pointing to the last weekday of a year and month.

[*Note 1*: `year_month_weekday_last` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_weekday_last` meets the *Cpp17EqualityComparable* (Table 25) requirements.

2 `year_month_weekday_last` is a trivially copyable and standard-layout class type.

27.8.17.2 Member functions [time.cal.ymwdlast.members]

```
constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
                                  const chrono::weekday_last& wdl) noexcept;
```

1 *Effects*: Initializes `y_` with `y`, `m_` with `m`, and `wdl_` with `wdl`.

```
constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

3 *Effects*: `*this = *this + m`.

4 *Returns*: `*this`.

```
constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
```

5 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

6 *Effects*: `*this = *this - m`.

7 *Returns*: `*this`.

```
constexpr year_month_weekday_last& operator+=(const years& y) noexcept;
```

8 *Effects*: `*this = *this + y`.

9 *Returns*: `*this`.

```
constexpr year_month_weekday_last& operator-=(const years& y) noexcept;
```

10 *Effects*: `*this = *this - y`.

11 *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

12 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

13 *Returns*: `m_`.

```
constexpr chrono::weekday weekday() const noexcept;
```

14 *Returns*: `wdl_.weekday()`.

```
constexpr chrono::weekday_last weekday_last() const noexcept;
```

15 *Returns*: `wdl_`.

```
constexpr operator sys_days() const noexcept;
```

16 *Returns*: If `ok() == true`, returns a `sys_days` that represents the last `weekday()` of `year()/month()`. Otherwise the returned value is unspecified.

```
constexpr explicit operator local_days() const noexcept;
```

17 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

18 *Returns*: `y_.ok() && m_.ok() && wdl_.ok()`.

27.8.17.3 Non-member functions [time.cal.ymwdlast.nonmembers]

```
constexpr bool operator==(const year_month_weekday_last& x,
                          const year_month_weekday_last& y) noexcept;
```

1 *Returns*:

```
x.year() == y.year() && x.month() == y.month() && x.weekday_last() == y.weekday_last()
```

```
constexpr year_month_weekday_last
  operator+(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

3 *Returns*: `(ymwdl.year() / ymwdl.month() + dm) / ymwdl.weekday_last()`.

```
constexpr year_month_weekday_last
  operator+(const months& dm, const year_month_weekday_last& ymwdl) noexcept;
```

4 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

5 *Returns*: `ymwdl + dm`.

```
constexpr year_month_weekday_last
  operator-(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.4.4.3).

7 *Returns*: `ymwdl + (-dm)`.

```
constexpr year_month_weekday_last
  operator+(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
```

8 *Returns*: `{ymwdl.year()+dy, ymwdl.month(), ymwdl.weekday_last()}`.

```
constexpr year_month_weekday_last
  operator+(const years& dy, const year_month_weekday_last& ymwdl) noexcept;
```

9 *Returns*: `ymwdl + dy`.

```
constexpr year_month_weekday_last
  operator-(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
```

10 *Returns*: `ymwdl + (-dy)`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_weekday_last& ymwdl);
```

11 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}/{}"),
                    ymwdl.year(), ymwdl.month(), ymwdl.weekday_last());
```

27.8.18 Conventional syntax operators [time.cal.operators]

1 A set of overloaded `operator/` functions provides a conventional syntax for the creation of civil calendar dates.

2 [*Note 1*: The year, month, and day are accepted in any of the following 3 orders:

```
year/month/day
month/day/year
day/month/year
```

Anywhere a *day* is required, any of the following can also be specified:

```
last
weekday[i]
weekday[last]
```

— *end note*]

3 [*Note 2*: Partial-date types such as `year_month` and `month_day` can be created by not applying the second division operator for any of the three orders. For example:

```
year_month ym = 2015y/April;
month_day md1 = April/4;
month_day md2 = 4d/April;
```

— *end note*]

4 [*Example 1*:

```
auto a = 2015/4/4;          // a == int(125)
auto b = 2015y/4/4;         // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April;    // error: no viable operator/ for first /
auto d = 2015/April/4;      // error: no viable operator/ for first /
```

— *end example*]

```
constexpr year_month
  operator/(const year& y, const month& m) noexcept;
```

5 *Returns*: `{y, m}`.

```
constexpr year_month
  operator/(const year& y, int   m) noexcept;
```

6 *Returns*: `y / month(m)`.

```
constexpr month_day
  operator/(const month& m, const day& d) noexcept;
```

7 *Returns*: `{m, d}`.

```
constexpr month_day
  operator/(const month& m, int d) noexcept;
```

8 *Returns*: `m / day(d)`.

```
constexpr month_day
  operator/(int m, const day& d) noexcept;
```

9 *Returns*: `month(m) / d`.

```
constexpr month_day
  operator/(const day& d, const month& m) noexcept;
```

10 *Returns*: `m / d`.

```
constexpr month_day
  operator/(const day& d, int m) noexcept;
```

11 *Returns*: `month(m) / d`.

```
constexpr month_day_last
  operator/(const month& m, last_spec) noexcept;
```

12 *Returns*: `month_day_last{m}`.

```
constexpr month_day_last
  operator/(int m, last_spec) noexcept;
```

13 *Returns*: `month(m) / last`.

```
constexpr month_day_last
  operator/(last_spec, const month& m) noexcept;
```

14 *Returns*: `m / last`.

```
constexpr month_day_last
  operator/(last_spec, int m) noexcept;
```

15 *Returns*: `month(m) / last`.

```
constexpr month_weekday
  operator/(const month& m, const weekday_indexed& wdi) noexcept;
```

16 *Returns*: `{m, wdi}`.

```
constexpr month_weekday
  operator/(int m, const weekday_indexed& wdi) noexcept;
```

17 *Returns*: `month(m) / wdi`.

```
constexpr month_weekday
  operator/(const weekday_indexed& wdi, const month& m) noexcept;
```

18 *Returns*: `m / wdi`.

```
constexpr month_weekday
  operator/(const weekday_indexed& wdi, int m) noexcept;
```

19 *Returns*: `month(m) / wdi`.

```
constexpr month_weekday_last
  operator/(const month& m, const weekday_last& wdl) noexcept;
```

20 *Returns*: `{m, wdl}`.

```
constexpr month_weekday_last
  operator/(int m, const weekday_last& wdl) noexcept;
```

21 *Returns*: `month(m) / wdl`.

```
constexpr month_weekday_last
  operator/(const weekday_last& wdl, const month& m) noexcept;
```

22 *Returns*: `m / wdl`.

```
constexpr month_weekday_last
  operator/(const weekday_last& wdl, int m) noexcept;
```

23 *Returns*: `month(m) / wdl`.

```
constexpr year_month_day
  operator/(const year_month& ym, const day& d) noexcept;
```

24 *Returns*: `{ym.year(), ym.month(), d}`.

```
constexpr year_month_day
  operator/(const year_month& ym, int d) noexcept;
```

25 *Returns*: `ym / day(d)`.

```
constexpr year_month_day
  operator/(const year& y, const month_day& md) noexcept;
```

26 *Returns*: `y / md.month() / md.day()`.

```
constexpr year_month_day
  operator/(int y, const month_day& md) noexcept;
```

27 *Returns*: `year(y) / md`.

```
constexpr year_month_day
  operator/(const month_day& md, const year& y) noexcept;
```

28 *Returns*: `y / md`.

```
constexpr year_month_day
  operator/(const month_day& md, int y) noexcept;
```

29 *Returns*: `year(y) / md`.

```
constexpr year_month_day_last
  operator/(const year_month& ym, last_spec) noexcept;
```

30 *Returns*: `{ym.year(), month_day_last{ym.month()}}`.

```
constexpr year_month_day_last
  operator/(const year& y, const month_day_last& mdl) noexcept;
```

31 *Returns*: `{y, mdl}`.

```
constexpr year_month_day_last
  operator/(int y, const month_day_last& mdl) noexcept;
```

32 *Returns*: `year(y) / mdl`.

```
constexpr year_month_day_last
  operator/(const month_day_last& mdl, const year& y) noexcept;
```

33 *Returns*: `y / mdl`.

```
constexpr year_month_day_last
  operator/(const month_day_last& mdl, int y) noexcept;
```

34 *Returns*: `year(y) / mdl`.

```
constexpr year_month_weekday
  operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;
```

35 *Returns*: `{ym.year(), ym.month(), wdi}`.

```
constexpr year_month_weekday
  operator/(const year& y, const month_weekday& mwd) noexcept;
```

36 *Returns*: `{y, mwd.month(), mwd.weekday_indexed()}`.

```
constexpr year_month_weekday
  operator/(int y, const month_weekday& mwd) noexcept;
```

37 *Returns*: `year(y) / mwd`.

```
constexpr year_month_weekday
  operator/(const month_weekday& mwd, const year& y) noexcept;
```

38 *Returns*: `y / mwd`.

```
constexpr year_month_weekday
  operator/(const month_weekday& mwd, int y) noexcept;
```

39 *Returns*: `year(y) / mwd`.

```
constexpr year_month_weekday_last
  operator/(const year_month& ym, const weekday_last& wdl) noexcept;
```

40 *Returns*: `{ym.year(), ym.month(), wdl}`.

```
constexpr year_month_weekday_last
  operator/(const year& y, const month_weekday_last& mwdl) noexcept;
```

41 *Returns*: `{y, mwdl.month(), mwdl.weekday_last()}`.

```
constexpr year_month_weekday_last
  operator/(int y, const month_weekday_last& mwdl) noexcept;
```

42 *Returns*: `year(y) / mwdl`.

```
constexpr year_month_weekday_last
  operator/(const month_weekday_last& mwdl, const year& y) noexcept;
```

43 *Returns*: `y / mwdl`.

```
constexpr year_month_weekday_last
  operator/(const month_weekday_last& mwdl, int y) noexcept;
```

44 *Returns*: `year(y) / mwdl`.

27.9 Class template hh_mm_ss [time.hms]

27.9.1 Overview [time.hms.overview]

```
namespace std::chrono {
  template<class Duration> class hh_mm_ss {
  public:
    static constexpr unsigned fractional_width = see below;
    using precision                            = see below;

    constexpr hh_mm_ss() noexcept : hh_mm_ss{Duration::zero()} {}
    constexpr explicit hh_mm_ss(Duration d);

    constexpr bool is_negative() const noexcept;
    constexpr chrono::hours hours() const noexcept;
    constexpr chrono::minutes minutes() const noexcept;
    constexpr chrono::seconds seconds() const noexcept;
    constexpr precision subseconds() const noexcept;

    constexpr explicit operator precision() const noexcept;
    constexpr precision to_duration() const noexcept;

  private:
    bool            is_neg;     // exposition only
    chrono::hours   h;          // exposition only
    chrono::minutes m;          // exposition only
    chrono::seconds s;          // exposition only
    precision       ss;         // exposition only
  };
}
```

1 The `hh_mm_ss` class template splits a `duration` into a multi-field time structure *hours*:*minutes*:*seconds* and possibly *subseconds*, where *subseconds* will be a duration unit based on a non-positive power of 10. The `Duration` template parameter dictates the precision to which the time is split. A `hh_mm_ss` models negative durations with a distinct `is_negative` getter that returns `true` when the input duration is negative. The individual duration fields always return non-negative durations even when `is_negative()` indicates the structure is representing a negative duration.

2 If `Duration` is not an instance of `duration`, the program is ill-formed.

27.9.2 Members [time.hms.members]

```
static constexpr unsigned fractional_width = see below;
```

1 `fractional_width` is the number of fractional decimal digits represented by `precision`. `fractional_width` has the value of the smallest possible integer in the range `[0, 18]` such that `precision` will exactly represent all values of `Duration`. If no such value of `fractional_width` exists, then `fractional_width` is 6.

[*Example 1*: See Table 98 for some durations, the resulting `fractional_width`, and the formatted fractional second output of `Duration{1}`.

Table 98: Examples for `fractional_width` [tab:time.hms.width]

Duration	fractional_width	Formatted fractional second output
hours, minutes, and seconds	0	
milliseconds	3	0.001
microseconds	6	0.000001

Table 98: Examples for fractional_width (continued)

Duration	fractional_width	Formatted fractional second output
nanoseconds	9	0.000000001
duration<int, ratio<1, 2>>	1	0.5
duration<int, ratio<1, 3>>	6	0.333333
duration<int, ratio<1, 4>>	2	0.25
duration<int, ratio<1, 5>>	1	0.2
duration<int, ratio<1, 6>>	6	0.166666
duration<int, ratio<1, 7>>	6	0.142857
duration<int, ratio<1, 8>>	3	0.125
duration<int, ratio<1, 9>>	6	0.111111
duration<int, ratio<1, 10>>	1	0.1
duration<int, ratio<756, 625>>	4	0.2096

— *end example*]

```
using precision = see below;
```

2 precision is

duration<common_type_t<Duration::rep, seconds::rep>, ratio<1, $10^{\texttt{fractional\_width}}$>>

```
constexpr explicit hh_mm_ss(Duration d);
```

3 *Effects*: Constructs an object of type hh_mm_ss which represents the Duration d with precision precision.

(3.1) — Initializes is_neg with d < Duration::zero().

(3.2) — Initializes h with duration_cast<chrono::hours>(abs(d)).

(3.3) — Initializes m with duration_cast<chrono::minutes>(abs(d) - hours()).

(3.4) — Initializes s with duration_cast<chrono::seconds>(abs(d) - hours() - minutes()).

(3.5) — If treat_as_floating_point_v<precision::rep> is true, initializes ss with abs(d) - hours() - minutes() - seconds(). Otherwise, initializes ss with duration_cast<precision>(abs(d) - hours() - minutes() - seconds()).

[*Note 1*: When precision::rep is integral and precision::period is ratio<1>, subseconds() always returns a value equal to 0s. — *end note*]

4 *Postconditions*: If treat_as_floating_point_v<precision::rep> is true, to_duration() returns d, otherwise to_duration() returns duration_cast<precision>(d).

```
constexpr bool is_negative() const noexcept;
```

5 *Returns*: is_neg.

```
constexpr chrono::hours hours() const noexcept;
```

6 *Returns*: h.

```
constexpr chrono::minutes minutes() const noexcept;
```

7 *Returns*: m.

```
constexpr chrono::seconds seconds() const noexcept;
```

8 *Returns*: s.

```
constexpr precision subseconds() const noexcept;
```

9 *Returns*: ss.

```
constexpr precision to_duration() const noexcept;
```

10 *Returns*: If is_neg, returns -(h + m + s + ss), otherwise returns h + m + s + ss.

```
constexpr explicit operator precision() const noexcept;
```

11 *Returns*: to_duration().

27.9.3 Non-members [time.hms.nonmembers]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const hh_mm_ss<Duration>& hms);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:%T}"), hms);
```

2 [*Example 1*:

```
for (auto ms : {-4083007ms, 4083007ms, 65745123ms}) {
  hh_mm_ss hms{ms};
  cout << hms << '\n';
}
cout << hh_mm_ss{65745s} << '\n';
```

Produces the output (assuming the "C" locale):

```
-01:08:03.007
01:08:03.007
18:15:45.123
18:15:45
```

— *end example*]

27.10 12/24 hours functions [time.12]

1 These functions aid in translating between a 12h format time of day and a 24h format time of day.

```
constexpr bool is_am(const hours& h) noexcept;
```

2 *Returns*: `0h <= h && h <= 11h`.

```
constexpr bool is_pm(const hours& h) noexcept;
```

3 *Returns*: `12h <= h && h <= 23h`.

```
constexpr hours make12(const hours& h) noexcept;
```

4 *Returns*: The 12-hour equivalent of `h` in the range `[1h, 12h]`. If `h` is not in the range `[0h, 23h]`, the value returned is unspecified.

```
constexpr hours make24(const hours& h, bool is_pm) noexcept;
```

5 *Returns*: If `is_pm` is `false`, returns the 24-hour equivalent of `h` in the range `[0h, 11h]`, assuming `h` represents an ante meridiem hour. Otherwise, returns the 24-hour equivalent of `h` in the range `[12h, 23h]`, assuming `h` represents a post meridiem hour. If `h` is not in the range `[1h, 12h]`, the value returned is unspecified.

27.11 Time zones [time.zone]

27.11.1 In general [time.zone.general]

1 27.11 describes an interface for accessing the IANA Time Zone Database that interoperates with `sys_time` and `local_time`. This interface provides time zone support to both the civil calendar types (27.8) and to user-defined calendars.

27.11.2 Time zone database [time.zone.db]

27.11.2.1 Class tzdb [time.zone.db.tzdb]

```
namespace std::chrono {
  struct tzdb {
    string                 version;
    vector<time_zone>      zones;
    vector<time_zone_link> links;
    vector<leap_second>    leap_seconds;

    const time_zone* locate_zone(string_view tz_name) const;
    const time_zone* current_zone() const;
  };
}
```

1 Each `vector` in a `tzdb` object is sorted to enable fast lookup.

```
const time_zone* locate_zone(string_view tz_name) const;
```

2 *Returns*:

(2.1) — If `zones` contains an element `tz` for which `tz.name() == tz_name`, a pointer to `tz`;

(2.2) — otherwise, if `links` contains an element `tz_l` for which `tz_l.name() == tz_name`, then a pointer to the element `tz` of `zones` for which `tz.name() == tz_l.target()`.

[*Note 1*: A `time_zone_link` specifies an alternative name for a `time_zone`. — *end note*]

3 *Throws*: If a `const time_zone*` cannot be found as described in the *Returns*: element, throws a `runtime_error`.

[*Note 2*: On non-exceptional return, the return value is always a pointer to a valid `time_zone`. — *end note*]

```
const time_zone* current_zone() const;
```

4 *Returns*: A pointer to the time zone which the computer has set as its local time zone.

27.11.2.2 Class `tzdb_list` [time.zone.db.list]

```
namespace std::chrono {
  class tzdb_list {
  public:
    tzdb_list(const tzdb_list&) = delete;
    tzdb_list& operator=(const tzdb_list&) = delete;

    // unspecified additional constructors

    class const_iterator;

    const tzdb& front() const noexcept;

    const_iterator erase_after(const_iterator p);

    const_iterator begin() const noexcept;
    const_iterator end()   const noexcept;

    const_iterator cbegin() const noexcept;
    const_iterator cend()   const noexcept;
  };
}
```

1 The `tzdb_list` database is a singleton; the unique object of type `tzdb_list` can be accessed via the `get_tzdb_list()` function.

[*Note 1*: This access is only needed for those applications that need to have long uptimes and have a need to update the time zone database while running. Other applications can implicitly access the `front()` of this list via the read-only namespace scope functions `get_tzdb()`, `locate_zone()`, and `current_zone()`. — *end note*]

The `tzdb_list` object contains a list of `tzdb` objects.

2 `tzdb_list::const_iterator` is a constant iterator which meets the *Cpp17ForwardIterator* requirements and has a value type of `tzdb`.

```
const tzdb& front() const noexcept;
```

3 *Synchronization*: This operation is thread-safe with respect to `reload_tzdb()`.

[*Note 2*: `reload_tzdb()` pushes a new `tzdb` onto the front of this container. — *end note*]

4 *Returns*: A reference to the first `tzdb` in the container.

```
const_iterator erase_after(const_iterator p);
```

5 *Preconditions*: The iterator following `p` is dereferenceable.

6 *Effects*: Erases the `tzdb` referred to by the iterator following `p`.

7 *Postconditions*: No pointers, references, or iterators are invalidated except those referring to the erased `tzdb`.

[*Note 3*: It is not possible to erase the `tzdb` referred to by `begin()`. — *end note*]

8 *Returns*: An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

9 *Throws*: Nothing.

```
const_iterator begin() const noexcept;
```

10 *Returns*: An iterator referring to the first `tzdb` in the container.

```
const_iterator end() const noexcept;
```

11 *Returns*: An iterator referring to the position one past the last `tzdb` in the container.

```
const_iterator cbegin() const noexcept;
```

12 *Returns*: `begin()`.

```
const_iterator cend() const noexcept;
```

13 *Returns*: `end()`.

27.11.2.3 Time zone database access [time.zone.db.access]

```
tzdb_list& get_tzdb_list();
```

1 *Effects*: If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a `tzdb_list` holding a single initialized `tzdb`.

2 *Synchronization*: It is safe to call this function from multiple threads at one time.

3 *Returns*: A reference to the database.

4 *Throws*: `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb_list` containing one or more valid `tzdb`s.

```
const tzdb& get_tzdb();
```

5 *Returns*: `get_tzdb_list().front()`.

```
const time_zone* locate_zone(string_view tz_name);
```

6 *Returns*: `get_tzdb().locate_zone(tz_name)`.

7 [*Note 1*: The time zone database will be initialized if this is the first reference to the database. — *end note*]

```
const time_zone* current_zone();
```

8 *Returns*: `get_tzdb().current_zone()`.

27.11.2.4 Remote time zone database support [time.zone.db.remote]

1 The local time zone database is that supplied by the implementation when the program first accesses the database, for example via `current_zone()`. While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the *remote time zone database*.

```
const tzdb& reload_tzdb();
```

2 *Effects*: This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the `tzdb_list` accessed by `get_tzdb_list()`.

3 *Synchronization*: This function is thread-safe with respect to `get_tzdb_list().front()` and `get_tzdb_list().erase_after()`.

4 *Postconditions*: No pointers, references, or iterators are invalidated.

5 *Returns*: `get_tzdb_list().front()`.

6 *Throws*: `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb`.

```
string remote_version();
```

7 *Returns*: The latest remote database version.

[*Note 1*: This can be compared with `get_tzdb().version` to discover if the local and remote databases are equivalent. — *end note*]

27.11.3 Exception classes [time.zone.exception]

27.11.3.1 Class `nonexistent_local_time` [time.zone.exception.nonexist]

```
namespace std::chrono {
  class nonexistent_local_time : public runtime_error {
  public:
    template<class Duration>
      nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
  };
}
```

1 `nonexistent_local_time` is thrown when an attempt is made to convert a non-existent `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```
template<class Duration>
  nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
```

2 *Preconditions*: `i.result == local_info::nonexistent` is `true`.

3 *Effects*: Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```
ostringstream os;
os << tp << " is in a gap between\n"
   << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ' '
   << i.first.abbrev << " and\n"
   << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ' '
   << i.second.abbrev
   << " which are both equivalent to\n"
   << i.first.end << " UTC";
```

4 [*Example 1*:

```
#include <chrono>
#include <iostream>

int main() {
  using namespace std::chrono;
  try {
    auto zt = zoned_time{"America/New_York",
                         local_days{Sunday[2]/March/2016} + 2h + 30min};
  } catch (const nonexistent_local_time& e) {
    std::cout << e.what() << '\n';
  }
}
```

Produces the output:

```
2016-03-13 02:30:00 is in a gap between
2016-03-13 02:00:00 EST and
2016-03-13 03:00:00 EDT which are both equivalent to
2016-03-13 07:00:00 UTC
```

— *end example*]

27.11.3.2 Class `ambiguous_local_time` [time.zone.exception.ambig]

```
namespace std::chrono {
  class ambiguous_local_time : public runtime_error {
  public:
    template<class Duration>
      ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
  };
}
```

1 `ambiguous_local_time` is thrown when an attempt is made to convert an ambiguous `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```
template<class Duration>
  ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
```

2 *Preconditions*: `i.result == local_info::ambiguous` is `true`.

3 *Effects*: Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```
ostringstream os;
os << tp << " is ambiguous.  It could be\n"
   << tp << ' ' << i.first.abbrev << " == "
   << tp - i.first.offset << " UTC or\n"
   << tp << ' ' << i.second.abbrev  << " == "
   << tp - i.second.offset  << " UTC";
```

4 [*Example 1*:

```
#include <chrono>
#include <iostream>

int main() {
  using namespace std::chrono;
  try {
    auto zt = zoned_time{"America/New_York",
                         local_days{Sunday[1]/November/2016} + 1h + 30min};
  } catch (const ambiguous_local_time& e) {
    std::cout << e.what() << '\n';
  }
}
```

Produces the output:

```
2016-11-06 01:30:00 is ambiguous.  It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC
```

—*end example*]

27.11.4 Information classes [time.zone.info]

27.11.4.1 Class `sys_info` [time.zone.info.sys]

```
namespace std::chrono {
  struct sys_info {
    sys_seconds   begin;
    sys_seconds   end;
    seconds       offset;
    minutes       save;
    string        abbrev;
  };
}
```

1 A `sys_info` object can be obtained from the combination of a `time_zone` and either a `sys_time` or `local_time`. It can also be obtained from a `zoned_time`, which is effectively a pair of a `time_zone` and `sys_time`.

2 [*Note 1*: This type provides a low-level interface to time zone information. Typical conversions from `sys_time` to `local_time` will use this class implicitly, not explicitly. —*end note*]

3 The `begin` and `end` data members indicate that, for the associated `time_zone` and `time_point`, the `offset` and `abbrev` are in effect in the range `[begin, end)`. This information can be used to efficiently iterate the transitions of a `time_zone`.

4 The `offset` data member indicates the UTC offset in effect for the associated `time_zone` and `time_point`. The relationship between `local_time` and `sys_time` is:

```
offset = local_time - sys_time
```

5 The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0min`, this `sys_info` is said to be on "daylight saving" time, and `offset - save`

suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0min`. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range `[begin, end)` (if `save != 0min` for this `sys_info`).

6 The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_info& r);
```

7 *Effects*: Streams out the `sys_info` object `r` in an unspecified format.

8 *Returns*: `os`.

27.11.4.2 Class `local_info` [time.zone.info.local]

```
namespace std::chrono {
  struct local_info {
    static constexpr int unique      = 0;
    static constexpr int nonexistent = 1;
    static constexpr int ambiguous   = 2;

    int result;
    sys_info first;
    sys_info second;
  };
}
```

1 [*Note 1*: This type provides a low-level interface to time zone information. Typical conversions from `local_time` to `sys_time` will use this class implicitly, not explicitly. — *end note*]

2 Describes the result of converting a `local_time` to a `sys_time` as follows:

(2.1) — When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.

(2.2) — If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that ends just prior to the `local_time`, and `second` will be filled out with the `sys_info` that begins just after the `local_time`.

(2.3) — If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const local_info& r);
```

3 *Effects*: Streams out the `local_info` object `r` in an unspecified format.

4 *Returns*: `os`.

27.11.5 Class `time_zone` [time.zone.timezone]

27.11.5.1 Overview [time.zone.overview]

```
namespace std::chrono {
  class time_zone {
  public:
    time_zone(time_zone&&) = default;
    time_zone& operator=(time_zone&&) = default;

    // unspecified additional constructors

    string_view name() const noexcept;
```

```
    template<class Duration> sys_info   get_info(const sys_time<Duration>& st)   const;
    template<class Duration> local_info get_info(const local_time<Duration>& tp) const;

    template<class Duration>
      sys_time<common_type_t<Duration, seconds>>
        to_sys(const local_time<Duration>& tp) const;

    template<class Duration>
      sys_time<common_type_t<Duration, seconds>>
        to_sys(const local_time<Duration>& tp, choose z) const;

    template<class Duration>
      local_time<common_type_t<Duration, seconds>>
        to_local(const sys_time<Duration>& tp) const;
  };
}
```

1 A `time_zone` represents all time zone transitions for a specific geographic area. `time_zone` construction is unspecified, and performed as part of database initialization.

[*Note 1*: `const time_zone` objects can be accessed via functions such as `locate_zone`. — *end note*]

27.11.5.2 Member functions [time.zone.members]

```
string_view name() const noexcept;
```

1 *Returns*: The name of the `time_zone`.

2 [*Example 1*: `"America/New_York"`. — *end example*]

```
template<class Duration>
  sys_info get_info(const sys_time<Duration>& st) const;
```

3 *Returns*: A `sys_info i` for which `st` is in the range `[i.begin, i.end)`.

```
template<class Duration>
  local_info get_info(const local_time<Duration>& tp) const;
```

4 *Returns*: A `local_info` for `tp`.

```
template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp) const;
```

5 *Returns*: A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`.

6 *Throws*: If the conversion from `tp` to a `sys_time` is ambiguous, throws `ambiguous_local_time`. If the `tp` represents a non-existent time between two UTC `time_points`, throws `nonexistent_local_time`.

```
template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp, choose z) const;
```

7 *Returns*: A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`. If the conversion from `tp` to a `sys_time` is ambiguous, returns the earlier `sys_time` if `z == choose::earliest`, and returns the later `sys_time` if `z == choose::latest`. If the `tp` represents a non-existent time between two UTC `time_points`, then the two UTC `time_points` will be the same, and that UTC `time_point` will be returned.

```
template<class Duration>
  local_time<common_type_t<Duration, seconds>>
    to_local(const sys_time<Duration>& tp) const;
```

8 *Returns*: The `local_time` associated with `tp` and this `time_zone`.

27.11.5.3 Non-member functions [time.zone.nonmembers]

```
bool operator==(const time_zone& x, const time_zone& y) noexcept;
```

1 *Returns*: `x.name() == y.name()`.

```
strong_ordering operator<=>(const time_zone& x, const time_zone& y) noexcept;
```

2 *Returns*: `x.name() <=> y.name()`.

27.11.6 Class template zoned_traits [time.zone.zonedtraits]

```
namespace std::chrono {
  template<class T> struct zoned_traits {};
}
```

1 `zoned_traits` provides a means for customizing the behavior of `zoned_time<Duration, TimeZonePtr>` for the `zoned_time` default constructor, and constructors taking `string_view`. A specialization for `const time_zone*` is provided by the implementation:

```
namespace std::chrono {
  template<> struct zoned_traits<const time_zone*> {
    static const time_zone* default_zone();
    static const time_zone* locate_zone(string_view name);
  };
}
```

```
static const time_zone* default_zone();
```

2 *Returns*: `std::chrono::locate_zone("UTC")`.

```
static const time_zone* locate_zone(string_view name);
```

3 *Returns*: `std::chrono::locate_zone(name)`.

27.11.7 Class template zoned_time [time.zone.zonedtime]

27.11.7.1 Overview [time.zone.zonedtime.overview]

```
namespace std::chrono {
  template<class Duration, class TimeZonePtr = const time_zone*>
  class zoned_time {
  public:
    using duration = common_type_t<Duration, seconds>;

  private:
    TimeZonePtr        zone_;                    // exposition only
    sys_time<duration> tp_;                      // exposition only

    using traits = zoned_traits<TimeZonePtr>;    // exposition only

  public:
    zoned_time();
    zoned_time(const zoned_time&) = default;
    zoned_time& operator=(const zoned_time&) = default;

    zoned_time(const sys_time<Duration>& st);
    explicit zoned_time(TimeZonePtr z);
    explicit zoned_time(string_view name);

    template<class Duration2>
      zoned_time(const zoned_time<Duration2, TimeZonePtr>& zt);

    zoned_time(TimeZonePtr z,    const sys_time<Duration>& st);
    zoned_time(string_view name, const sys_time<Duration>& st);

    zoned_time(TimeZonePtr z,    const local_time<Duration>& tp);
    zoned_time(string_view name, const local_time<Duration>& tp);
    zoned_time(TimeZonePtr z,    const local_time<Duration>& tp, choose c);
    zoned_time(string_view name, const local_time<Duration>& tp, choose c);
```

```
    template<class Duration2, class TimeZonePtr2>
      zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& zt);
    template<class Duration2, class TimeZonePtr2>
      zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& zt, choose);

    template<class Duration2, class TimeZonePtr2>
      zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& zt);
    template<class Duration2, class TimeZonePtr2>
      zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& zt, choose);

    zoned_time& operator=(const sys_time<Duration>& st);
    zoned_time& operator=(const local_time<Duration>& ut);

    operator sys_time<duration>() const;
    explicit operator local_time<duration>() const;

    TimeZonePtr          get_time_zone()  const;
    local_time<duration> get_local_time() const;
    sys_time<duration>   get_sys_time()   const;
    sys_info             get_info()       const;
  };

  zoned_time() -> zoned_time<seconds>;

  template<class Duration>
    zoned_time(sys_time<Duration>)
      -> zoned_time<common_type_t<Duration, seconds>>;

  template<class TimeZonePtrOrName>
    using time-zone-representation =        // exposition only
      conditional_t<is_convertible_v<TimeZonePtrOrName, string_view>,
                    const time_zone*,
                    remove_cvref_t<TimeZonePtrOrName>>;

  template<class TimeZonePtrOrName>
    zoned_time(TimeZonePtrOrName&&)
      -> zoned_time<seconds, time-zone-representation<TimeZonePtrOrName>>;

  template<class TimeZonePtrOrName, class Duration>
    zoned_time(TimeZonePtrOrName&&, sys_time<Duration>)
      -> zoned_time<common_type_t<Duration, seconds>,
                    time-zone-representation<TimeZonePtrOrName>>;

  template<class TimeZonePtrOrName, class Duration>
    zoned_time(TimeZonePtrOrName&&, local_time<Duration>,
               choose = choose::earliest)
      -> zoned_time<common_type_t<Duration, seconds>,
                    time-zone-representation<TimeZonePtrOrName>>;

  template<class Duration, class TimeZonePtrOrName, class TimeZonePtr2>
    zoned_time(TimeZonePtrOrName&&, zoned_time<Duration, TimeZonePtr2>,
               choose = choose::earliest)
      -> zoned_time<common_type_t<Duration, seconds>,
                    time-zone-representation<TimeZonePtrOrName>>;
}
```

1 `zoned_time` represents a logical pairing of a `time_zone` and a `time_point` with precision `Duration`. `zoned_time<Duration>` maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.

2 If `Duration` is not a specialization of `chrono::duration`, the program is ill-formed.

3 Every constructor of `zoned_time` that accepts a `string_view` as its first parameter does not participate in class template argument deduction (12.4.2.9).

27.11.7.2 Constructors [time.zone.zonedtime.ctor]

```
zoned_time();
```

1 *Constraints*: `traits::default_zone()` is a well-formed expression.

2 *Effects*: Initializes `zone_` with `traits::default_zone()` and default constructs `tp_`.

```
zoned_time(const sys_time<Duration>& st);
```

3 *Constraints*: `traits::default_zone()` is a well-formed expression.

4 *Effects*: Initializes `zone_` with `traits::default_zone()` and `tp_` with `st`.

```
explicit zoned_time(TimeZonePtr z);
```

5 *Preconditions*: `z` refers to a time zone.

6 *Effects*: Initializes `zone_` with `std::move(z)` and default constructs `tp_`.

```
explicit zoned_time(string_view name);
```

7 *Constraints*: `traits::locate_zone(string_view{})` is a well-formed expression and `zoned_time` is constructible from the return type of `traits::locate_zone(string_view{})`.

8 *Effects*: Initializes `zone_` with `traits::locate_zone(name)` and default constructs `tp_`.

```
template<class Duration2>
  zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);
```

9 *Constraints*: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is `true`.

10 *Effects*: Initializes `zone_` with `y.zone_` and `tp_` with `y.tp_`.

```
zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
```

11 *Preconditions*: `z` refers to a time zone.

12 *Effects*: Initializes `zone_` with `std::move(z)` and `tp_` with `st`.

```
zoned_time(string_view name, const sys_time<Duration>& st);
```

13 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `st`.

14 *Effects*: Equivalent to construction with `{traits::locate_zone(name), st}`.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
```

15 *Constraints*:

```
is_convertible_v<
  decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>{})),
  sys_time<duration>>
```

is `true`.

16 *Preconditions*: `z` refers to a time zone.

17 *Effects*: Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp)`.

```
zoned_time(string_view name, const local_time<Duration>& tp);
```

18 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `tp`.

19 *Effects*: Equivalent to construction with `{traits::locate_zone(name), tp}`.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
```

20 *Constraints*:

```
is_convertible_v<
  decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>{}, choose::earliest)),
  sys_time<duration>>
```

is `true`.

21 *Preconditions*: `z` refers to a time zone.

22 *Effects*: Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp, c)`.

```
zoned_time(string_view name, const local_time<Duration>& tp, choose c);
```

23 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)`, `local_time<Duration>`, and `choose`.

24 *Effects*: Equivalent to construction with `{traits::locate_zone(name), tp, c}`.

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
```

25 *Constraints*: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is `true`.

26 *Preconditions*: `z` refers to a valid time zone.

27 *Effects*: Initializes `zone_` with `std::move(z)` and `tp_` with `y.tp_`.

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);
```

28 *Constraints*: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is `true`.

29 *Preconditions*: `z` refers to a valid time zone.

30 *Effects*: Equivalent to construction with `{z, y}`.

31 [*Note 1*: The `choose` parameter has no effect. — *end note*]

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);
```

32 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and the type `zoned_time<Duration2, TimeZonePtr2>`.

33 *Effects*: Equivalent to construction with `{traits::locate_zone(name), y}`.

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);
```

34 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)`, the type `zoned_time<Duration2, TimeZonePtr2>`, and the type `choose`.

35 *Effects*: Equivalent to construction with `{traits::locate_zone(name), y, c}`.

36 [*Note 2*: The `choose` parameter has no effect. — *end note*]

27.11.7.3 Member functions [time.zone.zonedtime.members]

```
zoned_time& operator=(const sys_time<Duration>& st);
```

1 *Effects*: After assignment, `get_sys_time() == st`. This assignment has no effect on the return value of `get_time_zone()`.

2 *Returns*: `*this`.

```
zoned_time& operator=(const local_time<Duration>& lt);
```

3 *Effects*: After assignment, `get_local_time() == lt`. This assignment has no effect on the return value of `get_time_zone()`.

4 *Returns*: `*this`.

```
operator sys_time<duration>() const;
```

5 *Returns*: `get_sys_time()`.

```
explicit operator local_time<duration>() const;
```

6 *Returns*: `get_local_time()`.

```
TimeZonePtr get_time_zone() const;
```

7 *Returns*: `zone_`.

```
local_time<duration> get_local_time() const;
```

8 *Returns*: `zone_->to_local(tp_)`.

```
sys_time<duration> get_sys_time() const;
```

9 *Returns*: `tp_`.

```
sys_info get_info() const;
```

10 *Returns*: `zone_->get_info(tp_)`.

27.11.7.4 Non-member functions [time.zone.zonedtime.nonmembers]

```
template<class Duration1, class Duration2, class TimeZonePtr>
  bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
                  const zoned_time<Duration2, TimeZonePtr>& y);
```

1 *Returns*: `x.zone_ == y.zone_ && x.tp_ == y.tp_`.

```
template<class charT, class traits, class Duration, class TimeZonePtr>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os,
               const zoned_time<Duration, TimeZonePtr>& t);
```

2 *Effects*: Streams the value returned from `t.get_local_time()` to `os` using the format `"%F %T %Z"`.

3 *Returns*: `os`.

27.11.8 Class `leap_second` [time.zone.leap]

27.11.8.1 Overview [time.zone.leap.overview]

```
namespace std::chrono {
  class leap_second {
  public:
    leap_second(const leap_second&)            = default;
    leap_second& operator=(const leap_second&) = default;

    // unspecified additional constructors

    constexpr sys_seconds date() const noexcept;
    constexpr seconds value() const noexcept;
  };
}
```

1 Objects of type `leap_second` representing the date and value of the leap second insertions are constructed and stored in the time zone database when initialized.

2 [*Example 1*:

```
for (auto& l : get_tzdb().leap_seconds)
  if (l <= 2018y/March/17d)
    cout << l.date() << ": " << l.value() << '\n';
```

Produces the output:

```
1972-07-01 00:00:00: 1s
1973-01-01 00:00:00: 1s
1974-01-01 00:00:00: 1s
1975-01-01 00:00:00: 1s
1976-01-01 00:00:00: 1s
1977-01-01 00:00:00: 1s
1978-01-01 00:00:00: 1s
1979-01-01 00:00:00: 1s
1980-01-01 00:00:00: 1s
1981-07-01 00:00:00: 1s
1982-07-01 00:00:00: 1s
1983-07-01 00:00:00: 1s
1985-07-01 00:00:00: 1s
1988-01-01 00:00:00: 1s
1990-01-01 00:00:00: 1s
1991-01-01 00:00:00: 1s
1992-07-01 00:00:00: 1s
1993-07-01 00:00:00: 1s
```

```
1994-07-01 00:00:00: 1s
1996-01-01 00:00:00: 1s
1997-07-01 00:00:00: 1s
1999-01-01 00:00:00: 1s
2006-01-01 00:00:00: 1s
2009-01-01 00:00:00: 1s
2012-07-01 00:00:00: 1s
2015-07-01 00:00:00: 1s
2017-01-01 00:00:00: 1s
```

— *end example*]

27.11.8.2 Member functions [time.zone.leap.members]

```
constexpr sys_seconds date() const noexcept;
```

1 *Returns*: The date and time at which the leap second was inserted.

```
constexpr seconds value() const noexcept;
```

2 *Returns*: `+1s` to indicate a positive leap second or `-1s` to indicate a negative leap second.

[*Note 1*: All leap seconds inserted up through 2019 were positive leap seconds. — *end note*]

27.11.8.3 Non-member functions [time.zone.leap.nonmembers]

```
constexpr bool operator==(const leap_second& x, const leap_second& y) noexcept;
```

1 *Returns*: `x.date() == y.date()`.

```
constexpr strong_ordering operator<=>(const leap_second& x, const leap_second& y) noexcept;
```

2 *Returns*: `x.date() <=> y.date()`.

```
template<class Duration>
  constexpr bool operator==(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

3 *Returns*: `x.date() == y`.

```
template<class Duration>
  constexpr bool operator<(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

4 *Returns*: `x.date() < y`.

```
template<class Duration>
  constexpr bool operator<(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

5 *Returns*: `x < y.date()`.

```
template<class Duration>
  constexpr bool operator>(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

6 *Returns*: `y < x`.

```
template<class Duration>
  constexpr bool operator>(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

7 *Returns*: `y < x`.

```
template<class Duration>
  constexpr bool operator<=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

8 *Returns*: `!(y < x)`.

```
template<class Duration>
  constexpr bool operator<=(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

9 *Returns*: `!(y < x)`.

```
template<class Duration>
  constexpr bool operator>=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

10 *Returns*: `!(x < y)`.

```
template<class Duration>
  constexpr bool operator>=(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

11 *Returns*: `!(x < y)`.

```
template<class Duration>
  requires three_way_comparable_with<sys_seconds, sys_time<Duration>>
  constexpr auto operator<=>(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

12 *Returns*: `x.date() <=> y`.

27.11.9 Class `time_zone_link` [time.zone.link]

27.11.9.1 Overview [time.zone.link.overview]

```
namespace std::chrono {
  class time_zone_link {
  public:
    time_zone_link(time_zone_link&&)            = default;
    time_zone_link& operator=(time_zone_link&&) = default;

    // unspecified additional constructors

    string_view name()   const noexcept;
    string_view target() const noexcept;
  };
}
```

1 A `time_zone_link` specifies an alternative name for a `time_zone`. `time_zone_links` are constructed when the time zone database is initialized.

27.11.9.2 Member functions [time.zone.link.members]

```
string_view name() const noexcept;
```

1 *Returns*: The alternative name for the time zone.

```
string_view target() const noexcept;
```

2 *Returns*: The name of the `time_zone` for which this `time_zone_link` provides an alternative name.

27.11.9.3 Non-member functions [time.zone.link.nonmembers]

```
bool operator==(const time_zone_link& x, const time_zone_link& y) noexcept;
```

1 *Returns*: `x.name() == y.name()`.

```
strong_ordering operator<=>(const time_zone_link& x, const time_zone_link& y) noexcept;
```

2 *Returns*: `x.name() <=> y.name()`.

27.12 Formatting [time.format]

1 Each `formatter` (20.20.5) specialization in the chrono library (27.2) meets the *Formatter* requirements (20.20.5.1). The `parse` member functions of these formatters interpret the format specification as a *chrono-format-spec* according to the following syntax:

chrono-format-spec:
  fill-and-align$_{opt}$ *width*$_{opt}$ *precision*$_{opt}$ *chrono-specs*$_{opt}$

chrono-specs:
  conversion-spec
  chrono-specs conversion-spec
  chrono-specs literal-char

literal-char:
  any character other than `{`, `}`, or `%`

conversion-spec:
  `%` *modifier*$_{opt}$ *type*

modifier: one of
  `E O`

type: one of
`a A b B c C d D e F g G h H I j m M n`
`p q Q r R S t T u U V w W x X y Y z Z %`

The productions *fill-and-align*, *width*, and *precision* are described in 20.20.2. Giving a *precision* specification in the *chrono-format-spec* is valid only for `std::chrono::duration` types where the representation type `Rep` is a floating-point type. For all other `Rep` types, an exception of type `format_error` is thrown if the *chrono-format-spec* contains a *precision* specification. All ordinary multibyte characters represented by *literal-char* are copied unchanged to the output.

2 Each conversion specifier *conversion-spec* is replaced by appropriate characters as described in Table 99; the formats specified in ISO 8601:2004 shall be used where so described. Some of the conversion specifiers depend on the locale that is passed to the formatting function if the latter takes one, or the global locale otherwise. If the formatted object does not contain the information the conversion specifier refers to, an exception of type `format_error` is thrown.

3 The result of formatting a `std::chrono::duration` instance holding a negative value, or an `hh_mm_ss` object `h` for which `h.is_negative()` is `true`, is equivalent to the output of the corresponding positive value, with a *STATICALLY-WIDEN*`<charT>("-")` character sequence placed before the replacement of the initial conversion specifier.

[*Example 1*:

```
cout << format("{:%T}", -10'000s);           // prints: -02:46:40
cout << format("{:%H:%M:%S}", -10'000s);     // prints: -02:46:40
cout << format("minutes {:%M, hours %H, seconds %S}", -10'000s);
                                             // prints: minutes -46, hours 02, seconds 40
```

— *end example*]

4 Unless explicitly requested, the result of formatting a chrono type does not contain time zone abbreviation and time zone offset information. If the information is available, the conversion specifiers `%Z` and `%z` will format this information (respectively).

[*Note 1*: If the information is not available and a `%Z` or `%z` conversion specifier appears in the *chrono-format-spec*, an exception of type `format_error` is thrown, as described above. — *end note*]

5 If the type being formatted does not contain the information that the format flag needs, an exception of type `format_error` is thrown.

[*Example 2*: A `duration` does not contain enough information to format as a `weekday`. — *end example*]

However, if a flag refers to a "time of day" (e.g. `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is interpreted as the time of day elapsed since midnight.

Table 99: Meaning of conversion specifiers [tab:time.format.spec]

Specifier	Replacement
`%a`	The locale's abbreviated weekday name. If the value does not contain a valid weekday, an exception of type `format_error` is thrown.
`%A`	The locale's full weekday name. If the value does not contain a valid weekday, an exception of type `format_error` is thrown.
`%b`	The locale's abbreviated month name. If the value does not contain a valid month, an exception of type `format_error` is thrown.
`%B`	The locale's full month name. If the value does not contain a valid month, an exception of type `format_error` is thrown.
`%c`	The locale's date and time representation. The modified command `%Ec` produces the locale's alternate date and time representation.
`%C`	The year divided by 100 using floored division. If the result is a single decimal digit, it is prefixed with `0`. The modified command `%EC` produces the locale's alternative representation of the century.
`%d`	The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with `0`. The modified command `%Od` produces the locale's alternative representation.
`%D`	Equivalent to `%m/%d/%y`.

Table 99: Meaning of conversion specifiers (continued)

Specifier	Replacement
`%e`	The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with a space. The modified command `%Oe` produces the locale's alternative representation.
`%F`	Equivalent to `%Y-%m-%d`.
`%g`	The last two decimal digits of the ISO week-based year. If the result is a single digit it is prefixed by `0`.
`%G`	The ISO week-based year as a decimal number. If the result is less than four digits it is left-padded with `0` to four digits.
`%h`	Equivalent to `%b`.
`%H`	The hour (24-hour clock) as a decimal number. If the result is a single digit, it is prefixed with `0`. The modified command `%OH` produces the locale's alternative representation.
`%I`	The hour (12-hour clock) as a decimal number. If the result is a single digit, it is prefixed with `0`. The modified command `%OI` produces the locale's alternative representation.
`%j`	If the type being formatted is a specialization of `duration`, the decimal number of `days` without padding. Otherwise, the day of the year as a decimal number. Jan 1 is `001`. If the result is less than three digits, it is left-padded with `0` to three digits.
`%m`	The month as a decimal number. Jan is `01`. If the result is a single digit, it is prefixed with `0`. The modified command `%Om` produces the locale's alternative representation.
`%M`	The minute as a decimal number. If the result is a single digit, it is prefixed with `0`. The modified command `%OM` produces the locale's alternative representation.
`%n`	A new-line character.
`%p`	The locale's equivalent of the AM/PM designations associated with a 12-hour clock.
`%q`	The duration's unit suffix as specified in 27.5.11.
`%Q`	The duration's numeric value (as if extracted via `.count()`).
`%r`	The locale's 12-hour clock time.
`%R`	Equivalent to `%H:%M`.
`%S`	Seconds as a decimal number. If the number of seconds is less than `10`, the result is prefixed with `0`. If the precision of the input cannot be exactly represented with seconds, then the format is a decimal floating-point number with a fixed format and a precision matching that of the precision of the input (or to a microseconds precision if the conversion to floating-point decimal seconds cannot be made within 18 fractional digits). The character for the decimal point is localized according to the locale. The modified command `%OS` produces the locale's alternative representation.
`%t`	A horizontal-tab character.
`%T`	Equivalent to `%H:%M:%S`.
`%u`	The ISO weekday as a decimal number (`1`-`7`), where Monday is `1`. The modified command `%Ou` produces the locale's alternative representation.
`%U`	The week number of the year as a decimal number. The first Sunday of the year is the first day of week `01`. Days of the same year prior to that are in week `00`. If the result is a single digit, it is prefixed with `0`. The modified command `%OU` produces the locale's alternative representation.
`%V`	The ISO week-based week number as a decimal number. If the result is a single digit, it is prefixed with `0`. The modified command `%OV` produces the locale's alternative representation.
`%w`	The weekday as a decimal number (`0`-`6`), where Sunday is `0`. The modified command `%Ow` produces the locale's alternative representation.
`%W`	The week number of the year as a decimal number. The first Monday of the year is the first day of week `01`. Days of the same year prior to that are in week `00`. If the result is a single digit, it is prefixed with `0`. The modified command `%OW` produces the locale's alternative representation.
`%x`	The locale's date representation. The modified command `%Ex` produces the locale's alternate date representation.

Table 99: Meaning of conversion specifiers (continued)

Specifier	Replacement
`%X`	The locale's time representation. The modified command `%EX` produces the locale's alternate time representation.
`%y`	The last two decimal digits of the year. If the result is a single digit it is prefixed by `0`. The modified command `%Oy` produces the locale's alternative representation. The modified command `%Ey` produces the locale's alternative representation of offset from `%EC` (year only).
`%Y`	The year as a decimal number. If the result is less than four digits it is left-padded with `0` to four digits. The modified command `%EY` produces the locale's alternative full year representation.
`%z`	The offset from UTC in the ISO 8601:2004 format. For example `-0430` refers to 4 hours 30 minutes behind UTC. If the offset is zero, `+0000` is used. The modified commands `%Ez` and `%Oz` insert a `:` between the hours and minutes: `-04:30`. If the offset information is not available, an exception of type `format_error` is thrown.
`%Z`	The time zone abbreviation. If the time zone abbreviation is not available, an exception of type `format_error` is thrown.
`%%`	A `%` character.

6 If the *chrono-specs* is omitted, the chrono object is formatted as if by streaming it to `std::ostringstream os` and copying `os.str()` through the output iterator of the context with additional padding and adjustments as specified by the format specifiers.

[*Example 3*:

```
string s = format("{:=>8}", 42ms);        // value of s is "====42ms"
```

— *end example*]

```
template<class Duration, class charT>
  struct formatter<chrono::sys_time<Duration>, charT>;
```

7 *Remarks*: If `%Z` is used, it is replaced with *`STATICALLY-WIDEN`*`<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted.

```
template<class Duration, class charT>
  struct formatter<chrono::utc_time<Duration>, charT>;
```

8 *Remarks*: If `%Z` is used, it is replaced with *`STATICALLY-WIDEN`*`<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. If the argument represents a time during a positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is *`STATICALLY-WIDEN`*`<charT>("60")`.

```
template<class Duration, class charT>
  struct formatter<chrono::tai_time<Duration>, charT>;
```

9 *Remarks*: If `%Z` is used, it is replaced with *`STATICALLY-WIDEN`*`<charT>("TAI")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch()} -
  (sys_days{1970y/January/1} - sys_days{1958y/January/1})
```

```
template<class Duration, class charT>
  struct formatter<chrono::gps_time<Duration>, charT>;
```

10 *Remarks*: If `%Z` is used, it is replaced with *`STATICALLY-WIDEN`*`<charT>("GPS")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch()} +
  (sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})
```

```
template<class Duration, class charT>
  struct formatter<chrono::file_time<Duration>, charT>;
```

11 *Remarks*: If `%Z` is used, it is replaced with *`STATICALLY-WIDEN`*`<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with `clock_cast<system_clock>(t)`, or by a `utc_time` initialized with `clock_cast<utc_clock>(t)`, where `t` is the first argument to `format`.

```
template<class Duration, class charT>
  struct formatter<chrono::local_time<Duration>, charT>;
```

12 *Remarks*: If `%Z`, `%z`, or a modified version of `%z` is used, an exception of type `format_error` is thrown.

```
template<class Duration> struct local-time-format-t {           // exposition only
  local_time<Duration> time;                                    // exposition only
  const string* abbrev;                                         // exposition only
  const seconds* offset_sec;                                    // exposition only
};
```

```
template<class Duration>
  local-time-format-t<Duration>
    local_time_format(local_time<Duration> time, const string* abbrev = nullptr,
                      const seconds* offset_sec = nullptr);
```

13 *Returns*: `{time, abbrev, offset_sec}`.

```
template<class Duration, class charT>
  struct formatter<chrono::local-time-format-t<Duration>, charT>;
```

14 Let `f` be a *`local-time-format-t`*`<Duration>` object passed to `formatter::format`.

15 *Remarks*: If `%Z` is used, it is replaced with `*f.abbrev` if `f.abbrev` is not a null pointer value. If `%Z` is used and `f.abbrev` is a null pointer value, an exception of type `format_error` is thrown. If `%z` (or a modified variant of `%z`) is used, it is formatted with the value of `*f.offset_sec` if `f.offset_sec` is not a null pointer value. If `%z` (or a modified variant of `%z`) is used and `f.offset_sec` is a null pointer value, then an exception of type `format_error` is thrown.

```
template<class Duration, class TimeZonePtr, class charT>
struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT>
    : formatter<chrono::local-time-format-t<Duration>, charT> {
  template<class FormatContext>
    typename FormatContext::iterator
      format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx);
};
```

```
template<class FormatContext>
  typename FormatContext::iterator
    format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx);
```

16 *Effects*: Equivalent to:

```
sys_info info = tp.get_info();
return formatter<chrono::local-time-format-t<Duration>, charT>::
         format({tp.get_local_time(), &info.abbrev, &info.offset}, ctx);
```

27.13 Parsing [time.parse]

1 Each `parse` overload specified in this subclause calls `from_stream` unqualified, so as to enable argument dependent lookup (6.5.3). In the following paragraphs, let `is` denote an object of type `basic_istream<charT, traits>` and let `I` be `basic_istream<charT, traits>&`, where `charT` and `traits` are template parameters in that context.

```
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);
```

2 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), fmt.c_str(), tp)
```

is well-formed when treated as an unevaluated operand.

3 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp)` has type `I`, has value `is`, and calls `from_stream(is, fmt.c_str(), tp)`.

```
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev);
```

4 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), fmt.c_str(), tp, addressof(abbrev))
```

is well-formed when treated as an unevaluated operand.

5 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp, abbrev)` has type `I`, has value `is`, and calls `from_stream(is, fmt.c_str(), tp, addressof(abbrev))`.

```
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
          minutes& offset);
```

6 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
            fmt.c_str(), tp,
            declval<basic_string<charT, traits, Alloc>*>(),
            &offset)
```

is well-formed when treated as an unevaluated operand.

7 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp, offset)` has type `I`, has value `is`, and calls:

```
from_stream(is,
            fmt.c_str(), tp,
            static_cast<basic_string<charT, traits, Alloc>*>(nullptr),
            &offset)
```

```
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

8 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
            fmt.c_str(), tp, addressof(abbrev), &offset)
```

is well-formed when treated as an unevaluated operand.

9 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp, abbrev, offset)` has type `I`, has value `is`, and calls `from_stream(is, fmt.c_str(), tp, addressof(abbrev), &offset)`.

10 All `from_stream` overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to `basic_istream<>::gcount()`. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a `%`. Some flags can be modified by `E` or `O`. During parsing each flag interprets characters as parts of date and time types according to Table 100. Some flags can be modified by a width parameter given as a positive decimal integer called out as *N* below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in Table 100, except for whitespace, are parsed unchanged from the stream. A whitespace character matches zero or more whitespace characters in the input stream.

11 If the type being parsed cannot represent the information that the format flag refers to, `is.setstate(ios_base::failbit)` is called.

[*Example 1*: A `duration` cannot represent a `weekday`. — *end example*]

However, if a flag refers to a "time of day" (e.g. `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is parsed as the time of day elapsed since midnight.

12 If the `from_stream` overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, `setstate(ios_base::failbit)` is called on the `basic_istream`.

Table 100: Meaning of `parse` flags [tab:time.parse.spec]

Flag	Parsed value
`%a`	The locale's full or abbreviated case-insensitive weekday name.
`%A`	Equivalent to `%a`.
`%b`	The locale's full or abbreviated case-insensitive month name.
`%B`	Equivalent to `%b`.
`%c`	The locale's date and time representation. The modified command `%Ec` interprets the locale's alternate date and time representation.
`%C`	The century as a decimal number. The modified command `%NC` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%EC` interprets the locale's alternative representation of the century.
`%d`	The day of the month as a decimal number. The modified command `%Nd` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%Od` interprets the locale's alternative representation of the day of the month.
`%D`	Equivalent to `%m/%d/%y`.
`%e`	Equivalent to `%d` and can be modified like `%d`.
`%F`	Equivalent to `%Y-%m-%d`. If modified with a width *N*, the width is applied to only `%Y`.
`%g`	The last two decimal digits of the ISO week-based year. The modified command `%Ng` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required.
`%G`	The ISO week-based year as a decimal number. The modified command `%NG` specifies the maximum number of characters to read. If *N* is not specified, the default is 4. Leading zeroes are permitted but not required.
`%h`	Equivalent to `%b`.
`%H`	The hour (24-hour clock) as a decimal number. The modified command `%NH` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OH` interprets the locale's alternative representation.
`%I`	The hour (12-hour clock) as a decimal number. The modified command `%NI` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OI` interprets the locale's alternative representation.
`%j`	If the type being parsed is a specialization of `duration`, a decimal number of `days`. Otherwise, the day of the year as a decimal number. Jan 1 is `1`. In either case, the modified command `%Nj` specifies the maximum number of characters to read. If *N* is not specified, the default is 3. Leading zeroes are permitted but not required.
`%m`	The month as a decimal number. Jan is `1`. The modified command `%Nm` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%Om` interprets the locale's alternative representation.
`%M`	The minutes as a decimal number. The modified command `%NM` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OM` interprets the locale's alternative representation.
`%n`	Matches one whitespace character. [*Note 1*: `%n`, `%t`, and a space can be combined to match a wide range of whitespace patterns. For example, `"%n "` matches one or more whitespace characters, and `"%n%t%t"` matches one to three whitespace characters. — *end note*]
`%p`	The locale's equivalent of the AM/PM designations associated with a 12-hour clock.
`%r`	The locale's 12-hour clock time.
`%R`	Equivalent to `%H:%M`.

Table 100: Meaning of `parse` flags (continued)

Flag	Parsed value
`%S`	The seconds as a decimal number. The modified command `%NS` specifies the maximum number of characters to read. If `N` is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a `long double` in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command `%OS` interprets the locale's alternative representation.
`%t`	Matches zero or one whitespace characters.
`%T`	Equivalent to `%H:%M:%S`.
`%u`	The ISO weekday as a decimal number (`1`-`7`), where Monday is `1`. The modified command `%Nu` specifies the maximum number of characters to read. If `N` is not specified, the default is `1`. Leading zeroes are permitted but not required.
`%U`	The week number of the year as a decimal number. The first Sunday of the year is the first day of week `01`. Days of the same year prior to that are in week `00`. The modified command `%NU` specifies the maximum number of characters to read. If `N` is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OU` interprets the locale's alternative representation.
`%V`	The ISO week-based week number as a decimal number. The modified command `%NV` specifies the maximum number of characters to read. If `N` is not specified, the default is 2. Leading zeroes are permitted but not required.
`%w`	The weekday as a decimal number (`0`-`6`), where Sunday is `0`. The modified command `%Nw` specifies the maximum number of characters to read. If `N` is not specified, the default is `1`. Leading zeroes are permitted but not required. The modified command `%Ow` interprets the locale's alternative representation.
`%W`	The week number of the year as a decimal number. The first Monday of the year is the first day of week `01`. Days of the same year prior to that are in week `00`. The modified command `%NW` specifies the maximum number of characters to read. If `N` is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OW` interprets the locale's alternative representation.
`%x`	The locale's date representation. The modified command `%Ex` interprets the locale's alternate date representation.
`%X`	The locale's time representation. The modified command `%EX` interprets the locale's alternate time representation.
`%y`	The last two decimal digits of the year. If the century is not otherwise specified (e.g. with `%C`), values in the range `[69, 99]` are presumed to refer to the years 1969 to 1999, and values in the range `[00, 68]` are presumed to refer to the years 2000 to 2068. The modified command `%Ny` specifies the maximum number of characters to read. If `N` is not specified, the default is 2. Leading zeroes are permitted but not required. The modified commands `%Ey` and `%Oy` interpret the locale's alternative representation.
`%Y`	The year as a decimal number. The modified command `%NY` specifies the maximum number of characters to read. If `N` is not specified, the default is 4. Leading zeroes are permitted but not required. The modified command `%EY` interprets the locale's alternative representation.
`%z`	The offset from UTC in the format `[+|-]hh[mm]`. For example `-0430` refers to 4 hours 30 minutes behind UTC, and `04` refers to 4 hours ahead of UTC. The modified commands `%Ez` and `%Oz` parse a `:` between the hours and minutes and render leading zeroes on the hour field optional: `[+|-]h[h][:mm]`. For example `-04:30` refers to 4 hours 30 minutes behind UTC, and `4` refers to 4 hours ahead of UTC.
`%Z`	The time zone abbreviation or name. A single word is parsed. This word can only contain characters from the basic source character set (5.3) that are alphanumeric, or one of `'_'`, `'/'`, `'-'`, or `'+'`.
`%%`	A `%` character is extracted.

27.14 Header <ctime> synopsis [ctime.syn]

```
#define NULL see 17.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below

namespace std {
  using size_t = see 17.2.4;
  using clock_t = see below;
  using time_t = see below;

  struct timespec;
  struct tm;

  clock_t clock();
  double difftime(time_t time1, time_t time0);
  time_t mktime(struct tm* timeptr);
  time_t time(time_t* timer);
  int timespec_get(timespec* ts, int base);
  char* asctime(const struct tm* timeptr);
  char* ctime(const time_t* timer);
  struct tm* gmtime(const time_t* timer);
  struct tm* localtime(const time_t* timer);
  size_t strftime(char* s, size_t maxsize, const char* format, const struct tm* timeptr);
}
```

1 The contents of the header `<ctime>` are the same as the C standard library header `<time.h>`.[261]

2 The functions `asctime`, `ctime`, `gmtime`, and `localtime` are not required to avoid data races (16.4.6.10).

SEE ALSO: ISO C 7.27

261) `strftime` supports the C conversion specifiers `C`, `D`, `e`, `F`, `g`, `G`, `h`, `r`, `R`, `t`, `T`, `u`, `V`, and `z`, and the modifiers `E` and `O`.

28 Localization library [localization]

28.1 General [localization.general]

1 This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.

2 The following subclauses describe components for locales themselves, the standard facets, and facilities from the ISO C library, as summarized in Table 101.

Table 101: Localization library summary [tab:localization.summary]

	Subclause	Header
28.3	Locales	`<locale>`
28.4	Standard `locale` categories	
28.5	C library locales	`<clocale>`

28.2 Header `<locale>` synopsis [locale.syn]

```
namespace std {
  // 28.3.1, locale

  // 28.4.8, message retrieval
  class messages_base;
  template<class charT> class messages;
  template<class charT> class messages_byname;
}
```

1 The header `<locale>` defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.[262]

28.3 Locales [locales]

28.3.1 Class locale [locale]

28.3.1.1 General [locale.general]

```
namespace std {
  class locale {
  public:
    // types
    class facet;
    class id;
    using category = int;
    static const category    // values assigned here are for exposition only
      none     = 0,
      collate  = 0x010, ctype    = 0x020,
      monetary = 0x040, numeric  = 0x080,
      time     = 0x100, messages = 0x200,
      all = collate | ctype | monetary | numeric | time  | messages;

    // construct/copy/destroy
    locale() noexcept;
    locale(const locale& other) noexcept;
    explicit locale(const char* std_name);
    explicit locale(const string& std_name);
    locale(const locale& other, const char* std_name, category);
```

262) In this subclause, the type name `struct tm` is an incomplete type that is defined in `<ctime>` (27.14).

```
    locale(const locale& other, const string& std_name, category);
    template<class Facet> locale(const locale& other, Facet* f);
    locale(const locale& other, const locale& one, category);
    ~locale();                    // not virtual
    const locale& operator=(const locale& other) noexcept;
    template<class Facet> locale combine(const locale& other) const;

    // locale operations
    string name() const;

    bool operator==(const locale& other) const;

    template<class charT, class traits, class Allocator>
      bool operator()(const basic_string<charT, traits, Allocator>& s1,
                      const basic_string<charT, traits, Allocator>& s2) const;

    // global locale objects
    static       locale  global(const locale&);
    static const locale& classic();
  };
}
```

1 Class `locale` implements a type-safe polymorphic set of facets, indexed by facet *type*. In other words, a facet has a dual role: in one sense, it's just a class interface; at the same time, it's an index into a locale's set of facets.

2 Access to the facets of a `locale` is via two function templates, `use_facet<>` and `has_facet<>`.

3 [*Example 1*: An iostream `operator<<` might be implemented as:[263]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& s, Date d) {
  typename basic_ostream<charT, traits>::sentry cerberos(s);
  if (cerberos) {
    tm tmbuf; d.extract(tmbuf);
    bool failed =
      use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(
        s.getloc()).put(s, s, s.fill(), &tmbuf, 'x').failed();
    if (failed)
      s.setstate(s.badbit);      // might throw
  }
  return s;
}
```

— *end example*]

4 In the call to `use_facet<Facet>(loc)`, the type argument chooses a facet, making available all members of the named type. If `Facet` is not present in a locale, it throws the standard exception `bad_cast`. A C++ program can check if a locale implements a particular facet with the function template `has_facet<Facet>()`. User-defined facets may be installed in a locale, and used identically as may standard facets.

5 [*Note 1*: All locale semantics are accessed via `use_facet<>` and `has_facet<>`, except that:

(5.1) — A member operator template

```
operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)
```

is provided so that a locale can be used as a predicate argument to the standard collections, to collate strings.

(5.2) — Convenient global interfaces are provided for traditional `ctype` functions such as `isdigit()` and `isspace()`, so that given a locale object `loc` a C++ program can call `isspace(c, loc)`. (This eases upgrading existing extractors (29.7.4.3).)

— *end note*]

6 Once a facet reference is obtained from a locale object by calling `use_facet<>`, that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.

263) Note that in the call to `put`, the stream is implicitly converted to an `ostreambuf_iterator<charT, traits>`.

7 In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.

8 A `locale` constructed from a name string (such as `"POSIX"`), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string `"*"`.

9 Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (16.4.6.10).

28.3.1.2 Types [locale.types]

28.3.1.2.1 Type `locale::category` [locale.category]

```
using category = int;
```

1 *Valid* `category` values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is `true`, and represents the union of all categories. Further, the expression `(X | Y)`, where `X` and `Y` each represent a single category, represents the union of the two categories.

2 `locale` member functions expecting a `category` argument require one of the `category` values defined above, or the union of two or more such values. Such a `category` value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in Table 102.

Table 102: Locale category facets [tab:locale.category.facets]

Category	Includes facets
collate	`collate<char>`, `collate<wchar_t>`

ctype	`ctype<char>`, `ctype<wchar_t>`
	`codecvt<char, char, mbstate_t>`
	`codecvt<char16_t, char8_t, mbstate_t>`
	`codecvt<char32_t, char8_t, mbstate_t>`
	`codecvt<wchar_t, char, mbstate_t>`

monetary	`moneypunct<char>`, `moneypunct<wchar_t>`
	`moneypunct<char, true>`, `moneypunct<wchar_t, true>`
	`money_get<char>`, `money_get<wchar_t>`
	`money_put<char>`, `money_put<wchar_t>`

numeric	`numpunct<char>`, `numpunct<wchar_t>`
	`num_get<char>`, `num_get<wchar_t>`
	`num_put<char>`, `num_put<wchar_t>`

time	`time_get<char>`, `time_get<wchar_t>` `time_put<char>`, `time_put<wchar_t>`
messages	`messages<char>`, `messages<wchar_t>`

3 For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 102, `has_facet<Facet>(loc)` is `true`. Each `locale` member function which takes a `locale::category` argument operates on the corresponding set of facets.

4 An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 103.

5 The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<F>(l)` only for facet `F` of types `numpunct<charT>` and `ctype<charT>`, and for locale `l` the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.

6 In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that meet the *Cpp17InputIterator* requirements or

Table 103: Required specializations [tab:locale.spec]

Category	Includes facets
collate	`collate_byname<char>`, `collate_byname<wchar_t>`

ctype	`ctype_byname<char>`, `ctype_byname<wchar_t>`
	`codecvt_byname<char, char, mbstate_t>`
	`codecvt_byname<char16_t, char8_t, mbstate_t>`
	`codecvt_byname<char32_t, char8_t, mbstate_t>`
	`codecvt_byname<wchar_t, char, mbstate_t>`

monetary	`moneypunct_byname<char, International>`
	`moneypunct_byname<wchar_t, International>`
	`money_get<C, InputIterator>`
	`money_put<C, OutputIterator>`

numeric	`numpunct_byname<char>`, `numpunct_byname<wchar_t>` `num_get<C, InputIterator>`, `num_put<C, OutputIterator>`

time	`time_get<char, InputIterator>`
	`time_get_byname<char, InputIterator>`
	`time_get<wchar_t, InputIterator>`
	`time_get_byname<wchar_t, InputIterator>`
	`time_put<char, OutputIterator>`
	`time_put_byname<char, OutputIterator>`
	`time_put<wchar_t, OutputIterator>`
	`time_put_byname<wchar_t, OutputIterator>`

messages	`messages_byname<char>`, `messages_byname<wchar_t>`

Cpp17OutputIterator requirements, respectively (23.3). A template parameter with name `C` represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a bool parameter.

28.3.1.2.2 Class `locale::facet` [locale.facet]

```
namespace std {
  class locale::facet {
  protected:
    explicit facet(size_t refs = 0);
    virtual ~facet();
    facet(const facet&) = delete;
    void operator=(const facet&) = delete;
  };
}
```

1 Class `facet` is the base class for locale feature sets. A class is a *facet* if it is publicly derived from another facet, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:[264]

```
static ::std::locale::id id;
```

2 Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is *not* a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.

3 The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.

4 Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are *explicit*, preventing their participation in automatic conversions.

264) This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.

5 For some standard facets a standard "..._byname" class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no "..._byname" version of a facet, the base class implements named locale semantics itself by reference to other facets.

28.3.1.2.3 Class `locale::id` [locale.id]

```
namespace std {
  class locale::id {
  public:
    id();
    void operator=(const id&) = delete;
    id(const id&) = delete;
  };
}
```

1 The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.

2 [*Note 1*: Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet's `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.9.3.2). — *end note*]

28.3.1.3 Constructors and destructor [locale.cons]

`locale() noexcept;`

1 *Effects*: Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.

[*Note 1*: This constructor yields a copy of the current global locale. It is commonly used as a default argument for function parameters of type `const locale&`. — *end note*]

`explicit locale(const char* std_name);`

2 *Effects*: Constructs a locale using standard C locale names, e.g., `"POSIX"`. The resulting locale implements semantics defined to be associated with that name.

3 *Throws*: `runtime_error` if the argument is not valid, or is null.

4 *Remarks*: The set of valid string argument values is `"C"`, `""`, and any implementation-defined values.

`explicit locale(const string& std_name);`

5 *Effects*: The same as `locale(std_name.c_str())`.

`locale(const locale& other, const char* std_name, category);`

6 *Effects*: Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

7 *Throws*: `runtime_error` if the argument is not valid, or is null.

8 *Remarks*: The locale has a name if and only if `other` has a name.

`locale(const locale& other, const string& std_name, category cat);`

9 *Effects*: The same as `locale(other, std_name.c_str(), cat)`.

`template<class Facet> locale(const locale& other, Facet* f);`

10 *Effects*: Constructs a locale incorporating all facets from the first argument except that of type `Facet`, and installs the second argument as the remaining facet. If `f` is null, the resulting object is a copy of `other`.

11 *Remarks*: The resulting locale has no name.

```
locale(const locale& other, const locale& one, category cats);
```

12 *Effects*: Constructs a locale incorporating all facets from the first argument except those that implement `cats`, which are instead incorporated from the second argument.

13 *Remarks*: The resulting locale has a name if and only if the first two arguments have names.

```
const locale& operator=(const locale& other) noexcept;
```

14 *Effects*: Creates a copy of `other`, replacing the current value.

15 *Returns*: `*this`.

28.3.1.4 Members [locale.members]

```
template<class Facet> locale combine(const locale& other) const;
```

1 *Effects*: Constructs a locale incorporating all facets from `*this` except for that one facet of `other` that is identified by `Facet`.

2 *Returns*: The newly created locale.

3 *Throws*: `runtime_error` if `has_facet<Facet>(other)` is `false`.

4 *Remarks*: The resulting locale has no name.

```
string name() const;
```

5 *Returns*: The name of `*this`, if it has one; otherwise, the string `"*"`.

28.3.1.5 Operators [locale.operators]

```
bool operator==(const locale& other) const;
```

1 *Returns*: `true` if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; `false` otherwise.

```
template<class charT, class traits, class Allocator>
  bool operator()(const basic_string<charT, traits, Allocator>& s1,
                  const basic_string<charT, traits, Allocator>& s2) const;
```

2 *Effects*: Compares two strings according to the `collate<charT>` facet.

3 *Returns*:

```
use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(),
                                         s2.data(), s2.data() + s2.size()) < 0
```

4 *Remarks*: This member operator template (and therefore `locale` itself) meets the requirements for a comparator predicate template argument (Clause 25) applied to strings.

5 [*Example 1*: A vector of strings `v` can be collated according to collation rules in locale `loc` simply by (25.8.2, 22.3.11):

```
std::sort(v.begin(), v.end(), loc);
```

— *end example*]

28.3.1.6 Static members [locale.statics]

```
static locale global(const locale& loc);
```

1 *Effects*: Sets the global locale to its argument. Causes future calls to the constructor `locale()` to return a copy of the argument. If the argument has a name, does

```
setlocale(LC_ALL, loc.name().c_str());
```

otherwise, the effect on the C locale, if any, is implementation-defined.

2 *Returns*: The previous value of `locale()`.

3 *Remarks*: No library function other than `locale::global()` affects the value returned by `locale()`.
[*Note 1*: See 28.5 for data race considerations when `setlocale` is invoked. — *end note*]

```
static const locale& classic();
```

4 The "C" locale.

5 *Returns*: A locale that implements the classic "C" locale semantics, equivalent to the value `locale("C")`.

6 *Remarks*: This locale, its facets, and their member functions, do not change with time.

28.3.2 `locale` globals [locale.global.templates]

```
template<class Facet> const Facet& use_facet(const locale& loc);
```

1 *Mandates*: `Facet` is a facet class whose definition contains the public static member `id` as defined in 28.3.1.2.2.

2 *Returns*: A reference to the corresponding facet of `loc`, if present.

3 *Throws*: `bad_cast` if `has_facet<Facet>(loc)` is `false`.

4 *Remarks*: The reference returned remains valid at least as long as any copy of `loc` exists.

```
template<class Facet> bool has_facet(const locale& loc) noexcept;
```

5 *Returns*: `true` if the facet requested is present in `loc`; otherwise `false`.

28.3.3 Convenience interfaces [locale.convenience]

28.3.3.1 Character classification [classification]

```
template<class charT> bool isspace (charT c, const locale& loc);
template<class charT> bool isprint (charT c, const locale& loc);
template<class charT> bool iscntrl (charT c, const locale& loc);
template<class charT> bool isupper (charT c, const locale& loc);
template<class charT> bool islower (charT c, const locale& loc);
template<class charT> bool isalpha (charT c, const locale& loc);
template<class charT> bool isdigit (charT c, const locale& loc);
template<class charT> bool ispunct (charT c, const locale& loc);
template<class charT> bool isxdigit(charT c, const locale& loc);
template<class charT> bool isalnum (charT c, const locale& loc);
template<class charT> bool isgraph (charT c, const locale& loc);
template<class charT> bool isblank (charT c, const locale& loc);
```

1 Each of these functions `is`*F* returns the result of the expression:

```
use_facet<ctype<charT>>(loc).is(ctype_base::F, c)
```

where *F* is the `ctype_base::mask` value corresponding to that function (28.4.2).[265]

28.3.3.2 Character conversions [conversions.character]

```
template<class charT> charT toupper(charT c, const locale& loc);
```

1 *Returns*: `use_facet<ctype<charT>>(loc).toupper(c)`.

```
template<class charT> charT tolower(charT c, const locale& loc);
```

2 *Returns*: `use_facet<ctype<charT>>(loc).tolower(c)`.

28.4 Standard `locale` categories [locale.categories]

28.4.1 General [locale.categories.general]

1 Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users' iostream operators `<<` and `>>`, as members `put()` and `get()`, respectively. Each such member function takes an `ios_base&` argument whose members `flags()`, `precision()`, and `width()`, specify the format of the corresponding datum (29.5.3). Those functions which need to use other facets call its member `getloc()` to retrieve the locale imbued there. Formatting facets use the character argument `fill` to fill out the specified width where necessary.

2 The `put()` members make no provision for error reporting. (Any failures of the OutputIterator argument can be extracted from the returned iterator.) The `get()` members take an `ios_base::iostate&` argument whose value they ignore, but set to `ios_base::failbit` in case of a parse error.

265) When used in a loop, it is faster to cache the `ctype<>` facet and use it directly, or use the vector form of `ctype<>::is`.

3 Within subclause 28.4 it is unspecified whether one virtual function calls another virtual function.

28.4.2 The ctype category [category.ctype]

28.4.2.1 General [category.ctype.general]

```
namespace std {
  class ctype_base {
  public:
    using mask = see below;

    // numeric values are for exposition only.
    static const mask space  = 1 << 0;
    static const mask print  = 1 << 1;
    static const mask cntrl  = 1 << 2;
    static const mask upper  = 1 << 3;
    static const mask lower  = 1 << 4;
    static const mask alpha  = 1 << 5;
    static const mask digit  = 1 << 6;
    static const mask punct  = 1 << 7;
    static const mask xdigit = 1 << 8;
    static const mask blank  = 1 << 9;
    static const mask alnum  = alpha | digit;
    static const mask graph  = alnum | punct;
  };
}
```

1 The type `mask` is a bitmask type (16.3.3.3.4).

28.4.2.2 Class template ctype [locale.ctype]

28.4.2.2.1 General [locale.ctype.general]

```
namespace std {
  template<class charT>
    class ctype : public locale::facet, public ctype_base {
    public:
      using char_type = charT;

      explicit ctype(size_t refs = 0);

      bool         is(mask m, charT c) const;
      const charT* is(const charT* low, const charT* high, mask* vec) const;
      const charT* scan_is(mask m, const charT* low, const charT* high) const;
      const charT* scan_not(mask m, const charT* low, const charT* high) const;
      charT        toupper(charT c) const;
      const charT* toupper(charT* low, const charT* high) const;
      charT        tolower(charT c) const;
      const charT* tolower(charT* low, const charT* high) const;

      charT        widen(char c) const;
      const char*  widen(const char* low, const char* high, charT* to) const;
      char         narrow(charT c, char dfault) const;
      const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

      static locale::id id;

    protected:
      ~ctype();
      virtual bool         do_is(mask m, charT c) const;
      virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
      virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
      virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
      virtual charT        do_toupper(charT) const;
      virtual const charT* do_toupper(charT* low, const charT* high) const;
      virtual charT        do_tolower(charT) const;
      virtual const charT* do_tolower(charT* low, const charT* high) const;
```

```
    virtual charT       do_widen(char) const;
    virtual const char* do_widen(const char* low, const char* high, charT* dest) const;
    virtual char        do_narrow(charT, char dfault) const;
    virtual const charT* do_narrow(const charT* low, const charT* high,
                                   char dfault, char* dest) const;
  };
}
```

1 Class `ctype` encapsulates the C library `<cctype>` features. `istream` members are required to use `ctype<>` for character classing during input parsing.

2 The specializations required in Table 102 (28.3.1.2.1), namely `ctype<char>` and `ctype<wchar_t>`, implement character classing appropriate to the implementation's native character set.

28.4.2.2.2 ctype members [locale.ctype.members]

```
bool         is(mask m, charT c) const;
const charT* is(const charT* low, const charT* high, mask* vec) const;
```

1 *Returns*: `do_is(m, c)` or `do_is(low, high, vec)`.

```
const charT* scan_is(mask m, const charT* low, const charT* high) const;
```

2 *Returns*: `do_scan_is(m, low, high)`.

```
const charT* scan_not(mask m, const charT* low, const charT* high) const;
```

3 *Returns*: `do_scan_not(m, low, high)`.

```
charT        toupper(charT) const;
const charT* toupper(charT* low, const charT* high) const;
```

4 *Returns*: `do_toupper(c)` or `do_toupper(low, high)`.

```
charT        tolower(charT c) const;
const charT* tolower(charT* low, const charT* high) const;
```

5 *Returns*: `do_tolower(c)` or `do_tolower(low, high)`.

```
charT       widen(char c) const;
const char* widen(const char* low, const char* high, charT* to) const;
```

6 *Returns*: `do_widen(c)` or `do_widen(low, high, to)`.

```
char         narrow(charT c, char dfault) const;
const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;
```

7 *Returns*: `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`.

28.4.2.2.3 ctype virtual functions [locale.ctype.virtuals]

```
bool         do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high, mask* vec) const;
```

1 *Effects*: Classifies a character or sequence of characters. For each argument character, identifies a value `M` of type `ctype_base::mask`. The second form identifies a value `M` of type `ctype_base::mask` for each `*p` where `(low <= p && p < high)`, and places it into `vec[p - low]`.

2 *Returns*: The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```
const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
```

3 *Effects*: Locates a character in a buffer that conforms to a classification `m`.

4 *Returns*: The smallest pointer `p` in the range `[low, high)` such that `is(m, *p)` would return `true`; otherwise, returns `high`.

```
const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
```

5 *Effects*: Locates a character in a buffer that fails to conform to a classification `m`.

6 *Returns*: The smallest pointer `p`, if any, in the range `[low, high)` such that `is(m, *p)` would return `false`; otherwise, returns `high`.

```
charT        do_toupper(charT c) const;
const charT* do_toupper(charT* low, const charT* high) const;
```

7 *Effects*: Converts a character or characters to upper case. The second form replaces each character `*p` in the range `[low, high)` for which a corresponding upper-case character exists, with that character.

8 *Returns*: The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns `high`.

```
charT        do_tolower(charT c) const;
const charT* do_tolower(charT* low, const charT* high) const;
```

9 *Effects*: Converts a character or characters to lower case. The second form replaces each character `*p` in the range `[low, high)` and for which a corresponding lower-case character exists, with that character.

10 *Returns*: The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns `high`.

```
charT        do_widen(char c) const;
const char*  do_widen(const char* low, const char* high, charT* dest) const;
```

11 *Effects*: Applies the simplest reasonable transformation from a `char` value or sequence of `char` values to the corresponding `charT` value or values.[266] The only characters for which unique transformations are required are those in the basic source character set (5.3).

For any named `ctype` category with a `ctype <charT>` facet `ctc` and valid `ctype_base::mask` value `M`, `(ctc.is(M, c) || !is(M, do_widen(c)) )` is `true`.[267]

The second form transforms each character `*p` in the range `[low, high)`, placing the result in `dest[p - low]`.

12 *Returns*: The first form returns the transformed value. The second form returns `high`.

```
char         do_narrow(charT c, char dfault) const;
const charT* do_narrow(const charT* low, const charT* high, char dfault, char* dest) const;
```

13 *Effects*: Applies the simplest reasonable transformation from a `charT` value or sequence of `charT` values to the corresponding `char` value or values.

For any character `c` in the basic source character set (5.3) the transformation is such that

```
do_widen(do_narrow(c, 0)) == c
```

For any named `ctype` category with a `ctype<char>` facet `ctc` however, and `ctype_base::mask` value `M`,

```
(is(M, c) || !ctc.is(M, do_narrow(c, dfault)) )
```

is `true` (unless `do_narrow` returns `dfault`). In addition, for any digit character `c`, the expression `(do_narrow(c, dfault) - '0')` evaluates to the digit value of the character. The second form transforms each character `*p` in the range `[low, high)`, placing the result (or `dfault` if no simple transformation is readily available) in `dest[p - low]`.

14 *Returns*: The first form returns the transformed value; or `dfault` if no mapping is readily available. The second form returns `high`.

28.4.2.3 Class template `ctype_byname` [locale.ctype.byname]

```
namespace std {
  template<class charT>
    class ctype_byname : public ctype<charT> {
    public:
      using mask = typename ctype<charT>::mask;
      explicit ctype_byname(const char*, size_t refs = 0);
      explicit ctype_byname(const string&, size_t refs = 0);

    protected:
      ~ctype_byname();
```

266) The char argument of `do_widen` is intended to accept values derived from *character-literal*s for conversion to the locale's encoding.

267) In other words, the transformed character is not a member of any character classification that `c` is not also a member of.

```
    };
}
```

28.4.2.4 ctype<char> specialization [facet.ctype.special]

28.4.2.4.1 General [facet.ctype.special.general]

```
namespace std {
  template<>
    class ctype<char> : public locale::facet, public ctype_base {
    public:
      using char_type = char;

      explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);

      bool is(mask m, char c) const;
      const char* is(const char* low, const char* high, mask* vec) const;
      const char* scan_is (mask m, const char* low, const char* high) const;
      const char* scan_not(mask m, const char* low, const char* high) const;

      char        toupper(char c) const;
      const char* toupper(char* low, const char* high) const;
      char        tolower(char c) const;
      const char* tolower(char* low, const char* high) const;

      char  widen(char c) const;
      const char* widen(const char* low, const char* high, char* to) const;
      char  narrow(char c, char dfault) const;
      const char* narrow(const char* low, const char* high, char dfault, char* to) const;

      static locale::id id;
      static const size_t table_size = implementation-defined;

      const mask* table() const noexcept;
      static const mask* classic_table() noexcept;

    protected:
      ~ctype();
      virtual char        do_toupper(char c) const;
      virtual const char* do_toupper(char* low, const char* high) const;
      virtual char        do_tolower(char c) const;
      virtual const char* do_tolower(char* low, const char* high) const;

      virtual char        do_widen(char c) const;
      virtual const char* do_widen(const char* low, const char* high, char* to) const;
      virtual char        do_narrow(char c, char dfault) const;
      virtual const char* do_narrow(const char* low, const char* high,
                                    char dfault, char* to) const;
    };
}
```

1 A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.[268] The implementation-defined value of member `table_size` is at least 256.

28.4.2.4.2 Destructor [facet.ctype.char.dtor]

```
~ctype();
```

1 *Effects*: If the constructor's first argument was nonzero, and its second argument was `true`, does `delete [] table()`.

268) Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`.

28.4.2.4.3 Members [facet.ctype.char.members]

1 In the following member descriptions, for `unsigned char` values `v` where `v >= table_size`, `table()[v]` is assumed to have an implementation-specific value (possibly different for each such value `v`) without performing the array lookup.

```
explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);
```

2 *Preconditions*: Either `tbl == nullptr` is `true` or `[tbl, tbl+table_size)` is a valid range.

3 *Effects*: Passes its `refs` argument to its base class constructor.

```
bool        is(mask m, char c) const;
const char* is(const char* low, const char* high, mask* vec) const;
```

4 *Effects*: The second form, for all `*p` in the range `[low, high)`, assigns into `vec[p - low]` the value `table()[(unsigned char)*p]`.

5 *Returns*: The first form returns `table()[(unsigned char)c] & m`; the second form returns `high`.

```
const char* scan_is(mask m, const char* low, const char* high) const;
```

6 *Returns*: The smallest `p` in the range `[low, high)` such that

```
table()[(unsigned char) *p] & m
```

is `true`.

```
const char* scan_not(mask m, const char* low, const char* high) const;
```

7 *Returns*: The smallest `p` in the range `[low, high)` such that

```
table()[(unsigned char) *p] & m
```

is `false`.

```
char        toupper(char c) const;
const char* toupper(char* low, const char* high) const;
```

8 *Returns*: `do_toupper(c)` or `do_toupper(low, high)`, respectively.

```
char        tolower(char c) const;
const char* tolower(char* low, const char* high) const;
```

9 *Returns*: `do_tolower(c)` or `do_tolower(low, high)`, respectively.

```
char  widen(char c) const;
const char* widen(const char* low, const char* high, char* to) const;
```

10 *Returns*: `do_widen(c)` or `do_widen(low, high, to)`, respectively.

```
char        narrow(char c, char dfault) const;
const char* narrow(const char* low, const char* high, char dfault, char* to) const;
```

11 *Returns*: `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`, respectively.

```
const mask* table() const noexcept;
```

12 *Returns*: The first constructor argument, if it was nonzero, otherwise `classic_table()`.

28.4.2.4.4 Static members [facet.ctype.char.statics]

```
static const mask* classic_table() noexcept;
```

1 *Returns*: A pointer to the initial element of an array of size `table_size` which represents the classifications of characters in the `"C"` locale.

28.4.2.4.5 Virtual functions [facet.ctype.char.virtuals]

```
char        do_toupper(char) const;
const char* do_toupper(char* low, const char* high) const;
char        do_tolower(char) const;
const char* do_tolower(char* low, const char* high) const;
```

```
virtual char        do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char        do_narrow(char c, char dfault) const;
virtual const char* do_narrow(const char* low, const char* high,
                              char dfault, char* to) const;
```

1 These functions are described identically as those members of the same name in the `ctype` class template (28.4.2.2.2).

28.4.2.5 Class template `codecvt` [locale.codecvt]

28.4.2.5.1 General [locale.codecvt.general]

```
namespace std {
  class codecvt_base {
  public:
    enum result { ok, partial, error, noconv };
  };

  template<class internT, class externT, class stateT>
    class codecvt : public locale::facet, public codecvt_base {
    public:
      using intern_type = internT;
      using extern_type = externT;
      using state_type  = stateT;

      explicit codecvt(size_t refs = 0);

      result out(
        stateT& state,
        const internT* from, const internT* from_end, const internT*& from_next,
              externT*   to,       externT*   to_end,       externT*&   to_next) const;

      result unshift(
        stateT& state,

      virtual int do_encoding() const noexcept;
      virtual bool do_always_noconv() const noexcept;
      virtual int do_length(stateT&, const externT* from, const externT* end, size_t max) const;
```

```
      virtual int do_max_length() const noexcept;
    };
}
```

1 The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as UTF-32 and EUC.

2 The `stateT` argument selects the pair of character encodings being mapped between.

3 The specializations required in Table 102 (28.3.1.2.1) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. The specialization `codecvt<char16_t, char8_t, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt <char32_t, char8_t, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

28.4.2.5.2 Members [locale.codecvt.members]

```
result out(
  stateT& state,
  const internT* from, const internT* from_end, const internT*& from_next,
  externT* to, externT* to_end, externT*& to_next) const;
```

1 *Returns*: `do_out(state, from, from_end, from_next, to, to_end, to_next)`.

```
result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```

2 *Returns*: `do_unshift(state, to, to_end, to_next)`.

```
result in(
  stateT& state,
  const externT* from, const externT* from_end, const externT*& from_next,
  internT* to, internT* to_end, internT*& to_next) const;
```

3 *Returns*: `do_in(state, from, from_end, from_next, to, to_end, to_next)`.

```
int encoding() const noexcept;
```

4 *Returns*: `do_encoding()`.

```
bool always_noconv() const noexcept;
```

5 *Returns*: `do_always_noconv()`.

```
int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
```

6 *Returns*: `do_length(state, from, from_end, max)`.

```
int max_length() const noexcept;
```

7 *Returns*: `do_max_length()`.

28.4.2.5.3 Virtual functions [locale.codecvt.virtuals]

```
result do_out(
  stateT& state,
  const internT* from, const internT* from_end, const internT*& from_next,
  externT* to, externT* to_end, externT*& to_next) const;

result do_in(
  stateT& state,
  const externT* from, const externT* from_end, const externT*& from_next,
  internT* to, internT* to_end, internT*& to_next) const;
```

1 *Preconditions*: `(from <= from_end && to <= to_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

2 *Effects*: Translates characters in the source range `[from, from_end)`, placing the results in sequential positions starting at destination `to`. Converts no more than `(from_end - from)` source elements, and stores no more than `(to_end - to)` destination elements.

3 Stops if it encounters a character it cannot convert. It always leaves the `from_next` and `to_next` pointers pointing one beyond the last element successfully converted. If returns `noconv`, `internT` and `externT` are the same type and the converted sequence is identical to the input sequence `[from, from_next)`. `to_next` is set equal to `to`, the value of `state` is unchanged, and there are no changes to the values in `[to, to_end)`.

4 A `codecvt` facet that is used by `basic_filebuf` (29.9) shall have the property that if

```
do_out(state, from, from_end, from_next, to, to_end, to_next)
```

would return `ok`, where `from != from_end`, then

```
do_out(state, from, from + 1, from_next, to, to_end, to_next)
```

shall also return `ok`, and that if

```
do_in(state, from, from_end, from_next, to, to_end, to_next)
```

would return `ok`, where `to != to_end`, then

```
do_in(state, from, from_end, from_next, to, to + 1, to_next)
```

shall also return `ok`.[269]

[*Note 1*: As a result of operations on `state`, it can return `ok` or `partial` and set `from_next == from` and `to_next != to`. — *end note*]

5 *Remarks*: Its operations on `state` are unspecified.

[*Note 2*: This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets. — *end note*]

6 *Returns*: An enumeration value, as summarized in Table 104.

Table 104: `do_in/do_out` result values [tab:locale.codecvt.inout]

Value	Meaning
`ok`	completed the conversion
`partial`	not all source characters converted
`error`	encountered a character in `[from, from_end)` that it could not convert
`noconv`	`internT` and `externT` are the same type, and input sequence is identical to converted sequence

A return value of `partial`, if `(from_next == from_end)`, indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

```
result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```

7 *Preconditions*: `(to <= to_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

8 *Effects*: Places characters starting at `to` that should be appended to terminate a sequence when the current `stateT` is given by `state`.[270] Stores no more than `(to_end - to)` destination elements, and leaves the `to_next` pointer pointing one beyond the last element successfully stored.

9 *Returns*: An enumeration value, as summarized in Table 105.

269) Informally, this means that `basic_filebuf` assumes that the mappings from internal to external characters is 1 to N: that a `codecvt` facet that is used by `basic_filebuf` can translate characters one internal character at a time.
270) Typically these will be characters to return the state to `stateT()`.

Table 105: `do_unshift` result values [tab:locale.codecvt.unshift]

Value	Meaning
`ok`	completed the sequence
`partial`	space for more than `to_end - to` destination elements was needed to terminate a sequence given the value of `state`
`error`	an unspecified error has occurred
`noconv`	no termination is needed for this `state_type`

```
int do_encoding() const noexcept;
```

10 *Returns*: `-1` if the encoding of the `externT` sequence is state-dependent; else the constant number of `externT` characters needed to produce an internal character; or `0` if this number is not a constant.[271]

```
bool do_always_noconv() const noexcept;
```

11 *Returns*: `true` if `do_in()` and `do_out()` return `noconv` for all valid argument values. `codecvt<char, char, mbstate_t>` returns `true`.

```
int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
```

12 *Preconditions*: `(from <= from_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

13 *Effects*: The effect on the `state` argument is as if it called `do_in(state, from, from_end, from, to, to+max, to)` for `to` pointing to a buffer of at least `max` elements.

14 *Returns*: `(from_next-from)` where `from_next` is the largest value in the range `[from, from_end]` such that the sequence of values in the range `[from, from_next)` represents `max` or fewer valid complete characters of type `internT`. The specialization `codecvt<char, char, mbstate_t>`, returns the lesser of `max` and `(from_end-from)`.

```
int do_max_length() const noexcept;
```

15 *Returns*: The maximum value that `do_length(state, from, from_end, 1)` can return for any valid range `[from, from_end)` and `stateT` value `state`. The specialization `codecvt<char, char, mbstate_t>::do_max_length()` returns 1.

28.4.2.6 Class template `codecvt_byname` [locale.codecvt.byname]

```
namespace std {
  template<class internT, class externT, class stateT>
    class codecvt_byname : public codecvt<internT, externT, stateT> {
    public:
      explicit codecvt_byname(const char*, size_t refs = 0);
      explicit codecvt_byname(const string&, size_t refs = 0);

    protected:
      ~codecvt_byname();
    };
}
```

28.4.3 The numeric category [category.numeric]

28.4.3.1 General [category.numeric.general]

1 The classes `num_get<>` and `num_put<>` handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.[272]

271) If `encoding()` yields `-1`, then more than `max_length()` `externT` elements can be consumed when producing a single `internT` character, and additional `externT` elements can appear at the end of a sequence after those that yield the final `internT` character.

272) Parsing `"-1"` correctly into, e.g., an `unsigned short` requires that the corresponding member `get()` at least extract the sign before delegating.

2 All specifications of member functions for `num_put` and `num_get` in the subclauses of 28.4.3 only apply to the specializations required in Tables 102 and 103 (28.3.1.2.1), namely `num_get<char>`, `num_get<wchar_t>`, `num_get<C, InputIterator>`, `num_put<char>`, `num_put<wchar_t>`, and `num_put<C, OutputIterator>`. These specializations refer to the `ios_base&` argument for formatting specifications (28.4), and to its imbued locale for the `numpunct<>` facet to identify all numeric punctuation preferences, and also for the `ctype<>` facet to perform character classification.

3 Extractor and inserter members of the standard iostreams use `num_get<>` and `num_put<>` member functions for formatting and parsing numeric values (29.7.4.3.1, 29.7.5.3.1).

28.4.3.2 Class template num_get [locale.num.get]

28.4.3.2.1 General [locale.num.get.general]

```
namespace std {
  template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get : public locale::facet {
    public:
      using char_type = charT;
      using iter_type = InputIterator;

      explicit num_get(size_t refs = 0);

      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, bool& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, long& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, long long& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, unsigned short& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, unsigned int& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, unsigned long& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, unsigned long long& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, float& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, double& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, long double& v) const;
      iter_type get(iter_type in, iter_type end, ios_base&,
                    ios_base::iostate& err, void*& v) const;

      static locale::id id;

    protected:
      ~num_get();
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, bool& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, long& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, long long& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, unsigned short& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, unsigned int& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, unsigned long& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, unsigned long long& v) const;
```

```
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, float& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, double& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, long double& v) const;
      virtual iter_type do_get(iter_type, iter_type, ios_base&,
                               ios_base::iostate& err, void*& v) const;
    };
  }
```

1 The facet `num_get` is used to parse numeric values from an input sequence such as an istream.

28.4.3.2.2 Members [facet.num.get.members]

```
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, bool& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned short& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned int& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, float& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, void*& val) const;
```

1 *Returns*: `do_get(in, end, str, err, val)`.

28.4.3.2.3 Virtual functions [facet.num.get.virtuals]

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, void*& val) const;
```

1 *Effects*: Reads characters from `in`, interpreting them according to `str.flags()`, `use_facet<ctype<charT>>(loc)`, and `use_facet<numpunct<charT>>(loc)`, where `loc` is `str.getloc()`.

2 The details of this operation occur in three stages

(2.1) — Stage 1: Determine a conversion specifier

(2.2) — Stage 2: Extract characters from `in` and determine a corresponding `char` value for the format expected by the conversion specification determined in stage 1.

(2.3) — Stage 3: Store results

3 The details of the stages are presented below.

Stage 1: The function initializes local variables via

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);
```

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 106. The table is ordered. That is, the first line whose condition is true applies.

Table 106: Integer conversions [tab:facet.num.get.int]

State	`stdio` equivalent
`basefield == oct`	`%o`
`basefield == hex`	`%X`
`basefield == 0`	`%i`
`signed` integral type	`%d`
`unsigned` integral type	`%u`

For conversions to a floating-point type the specifier is `%g`.

For conversions to `void*` the specifier is `%p`.

A length modifier is added to the conversion specification, if needed, as indicated in Table 107.

Table 107: Length modifier [tab:facet.num.get.length]

Type	Length modifier
`short`	`h`
`unsigned short`	`h`
`long`	`l`
`unsigned long`	`l`
`long long`	`ll`
`unsigned long long`	`ll`
`double`	`l`
`long double`	`L`

Stage 2: If `in == end` then stage 2 terminates. Otherwise a `charT` is taken from `in` and local variables are initialized as if by

```
char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<numpunct<charT>>(loc).decimal_point())
c = '.';
bool discard =
  ct == use_facet<numpunct<charT>>(loc).thousands_sep()
  && use_facet<numpunct<charT>>(loc).grouping().length() != 0;
```

where the values `src` and `atoms` are defined as if by:

```
static const char src[] = "0123456789abcdefxABCDEFX+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);
```

for this value of `loc`.

If `discard` is `true`, then if `'.'` has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if `'.'` has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a check is made to determine if `c` is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then `in` is advanced by `++in` and processing returns to the beginning of stage 2.

Stage 3: The sequence of `char`s accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header `<cstdlib>`:

(3.1) — For a signed integer value, the function `strtoll`.

(3.2) — For an unsigned integer value, the function `strtoull`.

(3.3) — For a `float` value, the function `strtof`.

(3.4) — For a `double` value, the function `strtod`.

(3.5) — For a `long double` value, the function `strtold`.

The numeric value to be stored can be one of:

(3.6) — zero, if the conversion function does not convert the entire field.

(3.7) — the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in `val`.

(3.8) — the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in `val`.

(3.9) — the converted value, otherwise.

The resultant numeric value is stored in `val`. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, `ios_base::failbit` is assigned to `err`.

4 Digit grouping is checked. That is, the positions of discarded separators is examined for consistency with `use_facet<numpunct<charT>>(loc).grouping()`. If they are not consistent then `ios_base::failbit` is assigned to `err`.

5 In any case, if stage 2 processing was terminated by the test for `in == end` then `err |= ios_base::eofbit` is performed.

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, bool& val) const;
```

6 *Effects*: If `(str.flags()&ios_base::boolalpha) == 0` then input proceeds as it would for a `long` except that if a value is being stored into `val`, the value is determined according to the following: If the value to be stored is 0 then `false` is stored. If the value is `1` then `true` is stored. Otherwise `true` is stored and `ios_base::failbit` is assigned to `err`.

7 Otherwise target sequences are determined "as if" by calling the members `falsename()` and `truename()` of the facet obtained by `use_facet<numpunct<charT>>(str.getloc())`. Successive characters in the range `[in, end)` (see 22.2.3) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator `in` is compared to `end` only when necessary to obtain a character. If a target sequence is uniquely matched, `val` is set to the corresponding value. Otherwise `false` is stored and `ios_base::failbit` is assigned to `err`.

8 The `in` iterator is always left pointing one position beyond the last character successfully matched. If `val` is set, then `err` is set to `str.goodbit`; or to `str.eofbit` if, when seeking another character to match, it is found that `(in == end)`. If `val` is not set, then `err` is set to `str.failbit`; or to `(str.failbit|str.eofbit)` if the reason for the failure was that `(in == end)`.

[*Example 1*: For targets `true`: `"a"` and `false`: `"abb"`, the input sequence `"a"` yields `val == true` and `err == str.eofbit`; the input sequence `"abc"` yields `err = str.failbit`, with `in` ending at the `'c'` element. For targets `true`: `"1"` and `false`: `"0"`, the input sequence `"1"` yields `val == true` and `err == str.goodbit`. For empty targets `("")`, any input sequence yields `err == str.failbit`. — *end example*]

9 *Returns*: `in`.

28.4.3.3 Class template `num_put` [locale.nm.put]

28.4.3.3.1 General [locale.nm.put.general]

```
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put : public locale::facet {
    public:
      using char_type = charT;
```

```
    using iter_type = OutputIterator;

    explicit num_put(size_t refs = 0);

    iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

    static locale::id id;

  protected:
    ~num_put();
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
  };
}
```

1 The facet `num_put` is used to format numeric values to a character sequence such as an ostream.

28.4.3.3.2 Members [facet.num.put.members]

```
iter_type put(iter_type out, ios_base& str, char_type fill, bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;
```

1 *Returns*: `do_put(out, str, fill, val)`.

28.4.3.3.3 Virtual functions [facet.num.put.virtuals]

```
iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;
```

1 *Effects*: Writes characters to the sequence `out`, formatting `val` as desired. In the following description, `loc` names a local variable initialized as

```
locale loc = str.getloc();
```

2 The details of this operation occur in several stages:

(2.1) — Stage 1: Determine a printf conversion specifier `spec` and determine the characters that would be printed by `printf` (29.12) given this conversion specifier for

```
printf(spec, val)
```

assuming that the current locale is the `"C"` locale.

(2.2) — Stage 2: Adjust the representation by converting each `char` determined by stage 1 to a `charT` using a conversion and values returned by members of `use_facet<numpunct<charT>>(loc)`.

(2.3) — Stage 3: Determine where padding is required.

(2.4) — Stage 4: Insert the sequence into the `out`.

3 Detailed descriptions of each stage follow.

4 *Returns*: `out`.

Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

```
fmtflags flags = str.flags();
fmtflags basefield =  (flags & (ios_base::basefield));
fmtflags uppercase =  (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos =    (flags & (ios_base::showpos));
fmtflags showbase =   (flags & (ios_base::showbase));
fmtflags showpoint =  (flags & (ios_base::showpoint));
```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 108.

Table 108: Integer conversions [tab:facet.num.put.int]

State	`stdio` equivalent
`basefield == ios_base::oct`	`%o`
`(basefield == ios_base::hex) && !uppercase`	`%x`
`(basefield == ios_base::hex)`	`%X`
for a `signed` integral type	`%d`
for an `unsigned` integral type	`%u`

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 109.

Table 109: Floating-point conversions [tab:facet.num.put.fp]

State	`stdio` equivalent
`floatfield == ios_base::fixed`	`%f`
`floatfield == ios_base::scientific && !uppercase`	`%e`
`floatfield == ios_base::scientific`	`%E`
`floatfield == (ios_base::fixed | ios_base::scientific) && !uppercase`	`%a`
`floatfield == (ios_base::fixed | ios_base::scientific)`	`%A`
`!uppercase`	`%g`
otherwise	`%G`

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 110.

Table 110: Length modifier [tab:facet.num.put.length]

Type	Length modifier
`long`	`l`
`long long`	`ll`
`unsigned long`	`l`
`unsigned long long`	`ll`
`long double`	`L`
otherwise	*none*

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 111.

Table 111: Numeric conversions [tab:facet.num.put.conv]

Type(s)	State	stdio equivalent
an integral type	showpos	+
	showbase	#
a floating-point type	showpos	+
	showpoint	#

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.

For conversion from `void*` the specifier is `%p`.

The representations at the end of stage 1 consists of the `char`'s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

Stage 2: Any character `c` other than a decimal point(.) is converted to a `charT` via

```
use_facet<ctype<charT>>(loc).widen(c)
```

A local variable `punct` is initialized via

```
const numpunct<charT>& punct = use_facet<numpunct<charT>>(loc);
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in 28.4.4.1.3

Decimal point characters(.) are replaced by `punct.decimal_point()`

Stage 3: A local variable is initialized as

```
fmtflags adjustfield = (flags & (ios_base::adjustfield));
```

The location of any padding[273] is determined according to Table 112.

Table 112: Fill padding [tab:facet.num.put.fill]

State	Location
`adjustfield == ios_base::left`	pad after
`adjustfield == ios_base::right`	pad before
`adjustfield == internal` and a sign occurs in the representation	pad after the sign
`adjustfield == internal` and representation after stage 1 began with 0x or 0X	pad after x or X
otherwise	pad before

If `str.width()` is nonzero and the number of `charT`'s in the sequence after stage 2 is less than `str.width()`, then enough `fill` characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

Stage 4: The sequence of `charT`'s at the end of stage 3 are output via

```
*out++ = c
```

```
iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;
```

5 *Returns*: If `(str.flags() & ios_base::boolalpha) == 0` returns `do_put(out, str, fill, (int)val)`, otherwise obtains a string `s` as if by

```
string_type s =
  val ? use_facet<numpunct<charT>>(loc).truename()
      : use_facet<numpunct<charT>>(loc).falsename();
```

and then inserts each character `c` of `s` into `out` via `*out++ = c` and returns `out`.

273) The conversion specification `#o` generates a leading `0` which is *not* a padding character.

28.4.4 The numeric punctuation facet [facet.numpunct]

28.4.4.1 Class template numpunct [locale.numpunct]

28.4.4.1.1 General [locale.numpunct.general]

```
namespace std {
  template<class charT>
    class numpunct : public locale::facet {
    public:
      using char_type   = charT;
      using string_type = basic_string<charT>;

      explicit numpunct(size_t refs = 0);

      char_type    decimal_point()   const;
      char_type    thousands_sep()   const;
      string       grouping()        const;
      string_type  truename()        const;
      string_type  falsename()       const;

      static locale::id id;

    protected:
      ~numpunct();                                          // virtual
      virtual char_type    do_decimal_point() const;
      virtual char_type    do_thousands_sep() const;
      virtual string       do_grouping()      const;
      virtual string_type  do_truename()      const;       // for bool
      virtual string_type  do_falsename()     const;       // for bool
    };
}
```

1 `numpunct<>` specifies numeric punctuation. The specializations required in Table 102 (28.3.1.2.1), namely `numpunct<wchar_t>` and `numpunct<char>`, provide classic `"C"` numeric formats, i.e., they contain information equivalent to that contained in the `"C"` locale or their wide character counterparts as if obtained by a call to `widen`.

2 The syntax for number formats is as follows, where *digit* represents the radix set specified by the `fmtflags` argument value, and *thousands-sep* and *decimal-point* are the results of corresponding `numpunct<charT>` members. Integer values have the format:

intval:
  sign$_{opt}$ *units*

sign:
  `+`
  `-`

units:
  digits
  digits thousands-sep units

digits:
  digit digits$_{opt}$
